New York interests have purchased the plant of the Exeter Machine Works, West Pittston, Pa., and according to reports, plans are being formulated for the erection of extensive additions. No announcement has been made by the retiring controlling interests as to the identity of the new owners and a statement of this character is not expected for at least a month. No changes in the personnel of the offices and working forces will be made. The new owners plan to have the general offices of the company in New York, where a large engineering staff will be employed, and sales offices will be opened in Cleveland, Chicago and other cities. Six additional properties adjoining the plant have been purchased by the new owners, which will be used as sites for plant extensions. The company manufactures locomotive cranes, steam and electric hoists and special

May Absorb Tank Works

Absorption of the Petroleum Iron Works with a plant at Petroleum, O., by the Galena Signal Oil Co., a member of the Standard Oil group, is reported to be under negotiation. Although it is understood that a proposition for the purchase was laid before the annual meeting of the stockholders of the Petroleum company recently President George P. Baird, of Youngstown, refused to comment upon the matter. The stockholders at their meeting re-elected its old board of directors and the directors rechose the former officers. The company produces steel tank cars, tanks, oil refinery equipment, steel channel buoys, steel barrels and casks and a varied assortment of steel containers.

Donner to Discuss Bonds

The Donner Steel Co. stockholders will meet in special session Sept. 8 to vote on a proposition of creating a new $12,000,000 mortgage secured by a like amount of first and refunding 6 per cent bonds. Of the bonds it is proposed to issue for immediate sale $2,500,000 for the purpose of financing improvements near completion for the purchase of additional property and to reduce current indebtedness of something over $4,000,000.

Marlin-Rockwell Net Less

The six months manufacturing profit of the Marlin-Rockwell Corp. for the six months ended June 6 last, decreased $2,581,350 and total net income before taxes was $1,196,849 a decline of $1.827,447 and equal to $17.50 a share as compared with about $37 a share earned for the corresponding period of 1918. The statement shows: Sales, $7,051,235, decrease, $6,002,986; manufacturing profit, $1,151,535; decrease, $2,581,350; deductions from income, $422,997, decrease, $320,800; balance, $728,538, decrease, $2,260,549: additions to income, $468,311, increase, $364,453; total income before taxes, $1,196,849, decrease, $1,827,447.

The War Finance Corp. announces that advances of $220,885,523 have been repaid leaving an outstanding balance of $105,797,989. The loans were made to railroads, public utilities, cattle growers and industries. Although the corporation has authority to issue $1,000,000,000 in bonds for the financing of export trade, it is not expected that advances for this purpose will be made until after the conclusion of the peace treaty.

To Sell Phenol

Government Closes Contract With St. Louis Company—

New York, Sept. 2.—A contract was signed during the past week by the Monsanto Chemical Works of St. Louis, by which the latter becomes the agent of the government for the sale of large supplies of phenol which were bought during the war. The contract calls for the disposition of this phenol over a series of years and the profit allowed the Monsanto Chemical Works on the sale of this material is said to be practically negligible. It is stated contracts for the sale of government phenol simultaneously were offered to the Monsanto Chemical Works and to the Barrett Co., New York, but the latter refused to sign the contract.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .35
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.65

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .35
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.25 to 3.40

Demand for the various coal tar products is unchanged from a week ago. Benzol continues to be bought actively, in mixture with other coal tar products, for use as motor fuel. The demand for all kinds of coal tar products by the dyestuffs industry is keeping up well. The paint and rubber manufacturers continue to buy benzol actively. Prices are unchanged. A fair amount of benzol has been sold for export, particularly to South America. Fair amounts of naphthalin have been sold for export particularly to the Argentine and the Far East.

As a result of the contract business in sulphate of ammonia recently placed for the coming season, producers are in much better position as to unfilled orders. Spot business during the week was booked to some extent from domestic consumers and there also were some orders for prompt and nearby shipment for export. Prices continue unchanged.

Obituaries

George Elmer Miles, 76, treasurer of the Newport Shipbuilding & Drydock Co., died recently.

John Cordner West, mechanical engineer for the Sullivan Machinery Co., Chicago, was drowned at his summer home at St. Joseph, Mich., Aug. 23.

Layne Clinkofstine, who for 34 years was a prominent business man of Saginaw, Mich., and head of the firm of L. Clinkofstine & Co. that city, dealer in machinery and metals, died recently.

William J. Davis, general manager of Charles Davis & Co., iron and steel scrap dealers, died Aug. 25 at his home in Pittsburgh. Mr. Davis served 18 months with the ordnance department at Camp Hancock, Ga.

William J. Davis, general manager of Charles Davis & Co., iron and steel scrap dealers, died Aug. 25 at his home in Pittsburgh. Mr. Davis served 18 months with the ordnance department at Camp Hancock, Ga.

W. M. Blount, president and general manager of the Birmingham & Southeastern railway and vice president of the American Railroad Short Line association, with headquarters at Union Springs, Ala., died at his home in that city recently.

Col. Andrew Cowan, president of the Andrew Cowan & Co., Louisville, Ky., jobbers of mill and auto supplies, died on Aug. 23, of a lingering illness dating back almost a year. Col. Cowan also was director of several banks, and for several years a prominent leather manufacturer.

Staunton Kearfott, of Montclair, N. J., president of the Kearfott Engineering Co., 95 Liberty street, New York City, was instantly killed recently when the automobile which he was driving was struck by a trolley car at Port Reading, N. J. Mr. Kearfott served two years in France with the American army.

George W. Armpriester, for years superintendent of puddle mills in eastern Pennsylvania, died at his home in Harrisburg, Pa., aged 80 years. Mr. Armpriester was apprenticed to a puddler at Pottstown and became superintendent of the mill when a young man. He was then employed by the Charles L. Bailey Co., of Harrisburg, Pa., for years as superintendent of the Herr street puddle mill and later made a superintendent of mills in the Central Iron & Steel Co.

Unusual Program

Planned for Meet of Purchasing Agents Association at Philadelphia

Arrangements have been made for an unusual program at the third annual convention of the National Association of Purchasing Agents to be held Sept. 22, 23 and 24, at the Bellevue-Stratford hotel, Philadelphia. Total membership in the association is about 2500. Among the papers to be read by members of the association are the following:

"Relations Between the Purchasing Agent and His Company Organization," by F. A. Marsh, of the Link Belt Co., Chicago; "Relation Between the Purchasing Agent and Salesman," G. W. Sanborn, United Engineering & Foundry Co., Pittsburgh; "Analysis of the Purchasing Agent," K. H. Taylor, Illinois Glass Co., Alton, Ill.; "Relation of Traffic and Stores Departments to Purchasing," T. J. Hefferman, American Tube & Stamping Co., Bridgeport, Conn.

J. D. A. Morrow, secretary of the National Coal association, of Washington, will talk on "The Coal Situation," and J. H. Tregoe, secretary of the National Association of Credit Men, will give "The Relation of Credits to Purchasing."

The address of welcome will be by J. S. MacLaughlin, city director of supplies, Philadelphia, and the response by Dr. F. W. Russe, of the Mallinckrodt Chemical Works, St. Louis. A smoker and vaudeville will be given Monday evening and Tuesday evening there will be a boat trip on the Delaware river.

Officers of the National Association of Purchasing Agents are D. D. Ranken, of Wilmington, Del., president; F. J. Solon, of the Owens-Bottle Machine Co., Toledo, O., first vice president; J. A. Whaling, of the Solvay Process Co., Syracuse, N. Y., second vice president; V. W. Bergenthal, of the Wagner Electric Mfg. Co., St. Louis, third vice president; J. C. Dinsmore, of the University of Chicago, treasurer, and L. F. Boffey, of New York, secretary.

About 250 additional employes at the Gloucester City, N. J. shipyard of the Pusey & Jones Co. have been laid off, due to lack of work. At present new keels are not being laid as fast as completed vessels are launched so more employes are expected to be laid off in the near future. The working force has been reduced from 6000 to 2500 since the war ended.

Labor Affects August Tool Sales

While Expectations for Month Were Not Fulfilled Several Sizable Lots Were Closed — Many Industries Represented by Buyers — Automotive Trade Takes Many Tools — Fabricating Equipment Moves Freely — Prices Tend Upward

FULFILLMENT of prognostications concerning August as a banner tool-selling month was somewhat curtailed by labor's unrest and the generally disturbed economic conditions. Strikes among machinists in Bridgeport, Conn., Paterson, N. J., Rockford, Ill., Cincinnati and Akron, O., created more or less apprehension. Numerous cases are known where manufacturers in various lines, whose expansion plans had been perfected to a greater or less extent, tabled their equipment lists, postponing action until labor conditions become more stabilized. Notwithstanding these facts, however, many sellers of machinery claim to have enjoyed splendid sales totals. As has been the case for many weeks, these were made up almost entirely of small miscellaneous sales. With few exceptions large lists remained absent from the month's dealings. Price revisions upward continued through August and those buyers, who two or three months ago were looking for reductions, finally gave up hope and entered the markets for their equipment requirements. Additional increases are believed to be impending.

Automotive Industries Continue to Lead

ONE of the largest lists to be issued since the signing of the armistice came out early in the month from the White Motor Co., Cleveland. It called for between 250 and 300 tools, amounting to about $400,000. In fact the automotive industries continue to maintain the lead in tool buying. Approximately $50,000 worth of new equipment, mostly multiple spindle drills, was purchased by the North American Motors Co., Pottstown, Pa. The Aluminum Castings Co., Detroit, indicated its intention to purchase 50 multiple tool lathes for piston and heavy flange work at its Cleveland plant. The Parish & Bingham Co., Cleveland, bought planers, shapers, radial drills, etc., to manufacture automobile frames

Cranes Move Freely Early in Month

CRANE sales started out well in August, but fell off towards the latter part of the month. Steel manufacturers took small lots but one of the largest sales was made to the Baldwin Locomotive Works, Philadelphia; it comprised 16 overhead electric cranes. An inquiry for 15 was issued by the American Locomotive Works. The Cleveland Crane & Engineering Co., Wickliffe, O., was awarded a large contract for the Mare Island navy yard. The original specifications for which called for 27 cranes. The Standard Oil Co., New York, issued a list of 28 small jib cranes for Bayway, N. J. The Carnegie Steel Co., the Youngstown Steel Car Co., and the Youngstown Sheet & Tube Co., Youngstown, O., each purchased four cranes; the Midvale Steel & Ordnance Co., Philadelphia, inquired for five; the Bethlehem Steel Co., Sparrows Point, Md.; the Singer Mfg. Co., Elizabeth, N. J.; the Standard Sanitary Mfg. Co., Pittsburgh; Abendroth Bros., Port Chester, N. Y.

Railroads Start; Shipbuilders Again Active

SOME little buying took place by the railroads and shipbuilders. The Cumberland Valley railroad was reported to have purchased 25 tools and a small list was purchased by the New York Central. The Pennsylvania lines west is understood to be revising its tool lists and placed several fair sized orders. The Philadelphia & Reading bought about $25,000 worth of equipment and the Baltimore & Ohio as well as the Cambria & Indiana figured among the purchasers. Fabricating equipment was bought by the Winnismet Shipyard Co., Chelsea, Mass., and the Gould Construction Co., Long Island City, N. Y., the former taking eight and the latter five machines. Fraser, Brace & Co., 1328 Broadway, New York, took a quantity of tools and a traveling crane for a ship repair plant at Clifton, Staten Island, N. Y. The Perth Amboy Dry Dock Co., Perth Amboy, N. J., bought machinery to extend its ship repairing facilities as did the Morse Dry Dock & Repair Co., Staten Island, N. Y.

Exchange Rates Make Export Market Unsatisfactory

EXPORTERS of machine tools had greatly lowered exchange rates to contend with in August. Requirements of European countries are known to be large but buyers virtually have to pay a premium to obtain American-made machinery. Germany is taking advantage of this situation and is placing many machines especially in Scandinavian countries; she also is negotiating with Cincinnati manufacturers to resume antebellum relations. Perhaps the largest transaction reported during the month was the purchase of 80 tools by the Standard Oil Co., New York, for shipment to Roumania. An inquiry is current in New York for about 400 tools to equip an automobile plant in Sweden but purchases are postponed until exchange rates become more stabilized. This same thing is true concerning an inquiry from Poland for about 200 tools for a locomotive repair shop.

Different Manufacturers Buying Equipment

PHONOGRAPH and plow manufacturers, wrench makers, oil companies and adding machine builders as well as numerous other manufacturers were represented in the miscellaneous buying of the month. The Standard Oil Co., New York, bought over $400,000 worth of tools for various plants. The Sundstrand Adding Machine Co., Rockford, Ill., bought a number of tools and the American Smelting & Refining Co., New York, light equipment for a boiler shop in Alaska, while the Corn Products Refining Co., Chicago, took half a dozen tools and some other equipment. The Pathe Freres Phonograph Co., Brooklyn, N. Y., bought lathes and other tools and remains in the market. The Moline Plow Co., Poughkeepsie, N. Y., placed $20,000 worth, while the Bucyrus Co., Milwaukee, closed on 15 tools. Builders of machinery figured largely in the month's buying. The Foote-Burt Co., Cleveland, issued an inquiry for 50 tools. The E. W. Bliss Co., Brooklyn, N. Y., bought six; the Rickert-Shafter Co., Erie, Pa., a fair sized lot; the Aultman & Taylor Machinery Co., Mansfield, O., figured on eight tools; the Ingersoll Milling Machine Co., and the Mechanics Machine Co., Rockford, Ill., each bought equipment. The Pollak Steel Co., Cincinnati, issued an inquiry for 20 tools for a drop forge plant at Chicago. The B. F. Goodrich Co., and the Firestone Tire & Rubber Co., Akron, O., both issued sizable lists. The Allegheny Forging Co., Pittsburgh, bought at least a dozen tools.

Tool Sellers Encounter Obstacles

Labor Situation at Home and Exchange Rates Abroad Continue to Hinder Movement of Machine Tools—Several Fair Sized Lists Current in Cleveland and New York—Crane Awards Not Numerous

OBSTACLES continue to block the path of machinery sellers all over the country. Deterrents are furnished to domestic business by the labor situation and to foreign trading by the low exchange rate. Inquiries from abroad are numerous in the vicinity of New York, perhaps the largest being the one from Sweden for 400 tools for an automobile plant. Other lists come from France, Belgium, Spain, Japan and China, but many of them are simply feelers. China, however, purchased 12 drills. Canada too is receiving many inquiries from abroad, one in particular from a reconstruction division in France, for a varied line of equipment. Canada's export inquiries come from Russia, Australia, South Africa, Belgium and elsewhere, while its heavy domestic trade arises in the automobile industry.

Despite the trade hindrances sales are mounting These comprise clearances of one or two tools at a time in most cases, although several sizable lists are out in the middle west. Included in the list of prospective purchasers are the Columbia Axle Co., the Parish & Bingham Co. and the American Borvisk Co., Cleveland; Burke Electric Co., Erie, Pa.; Firestone Steel Products Co., B. F. Goodrich Co., Goodyear Tire & Rubber Co., and the Crescent Garage & Machine Co., Akron. Business in the middle west is well distributed among varied lines of industrial activity, several fair sized lists being current.

In Chicago, the General Motors Corp., has purchased about $75,000 worth of equipment for the Samson Tractor Works, Janesville, Wis., and another list is expected later. A large list is expected there from the Moline Plow Co., Moline, Ill., whose main machine shop was damaged by fire. An active market is reported in Pittsburgh, where the Pennsylvania railroad has started to buy.

Inquiries are current in New York from the International Motor Co., New Brunswick, N. J.; the Electric Auto-Lite Corp. and R. Hoe & Co., Poughkeepsie, N. Y., all three desiring to obtain miscellaneous equipment. Small brass casting makers in New York state have been large buyers of tools and manufacturers of printing presses in New England have been active.

Crane awards of size are not numerous. The Philadelphia navy yard however, bought five electric travelers from Niles-Bement-Pond Co., which company also closed a contract for 16 overhead cranes for the Baldwin Locomotive Works. The Midvale Steel & Ordnance Co. still is in the market for seven cranes for Johnstown and Coatesville, Pa. plants and the largest inquiry for cranes still current is that of the American Locomotive Works for 13. The Bethlehem Steel Co. also wants several. In Pittsburgh, many small crane inquiries are before sellers.

Exchange Rate is Obstacle to Foreign Sales

PENDING settlement of the steel labor question and improvement in foreign exchange rates, business in machine tools in New York and vicinity has been rather quiet. Dealers report a fair total turnover comprised of purchases of one or two tools, but large domestic lists of machine tools are few and far between. Little attention is being paid to the various export lists, some of them quite lengthy, which have been issued by export buyers, inasmuch as these usually have developed to be only feelers. France, Belgium, Poland, Sweden, Finland, Japan and China have been inquiring for machines, but exchange rates in Europe have prevented closing on most of these inquiries. China bought 12 drills through a New York exporter. A list of over 400 machines for a Swedish automobile plant still is being figured on in this market. There are several other Swedish inquiries, but it is expected America may have to compete with Germany on this business.

The International Motor Co. which recently took over the plant of the Wright-Martin Airplane Co. at New Brunswick, N. J., is figuring on machine tools. The Electric Auto-Lite Corp., Poughkeepsie, N. Y., is inquiring for several small machines. The R. Hoe & Co., which bought the Mitchell Co. plant at Poughkeepsie, is in the market for radial drills, shapers, planers, drill presses and other tools. The Adirondack Steel Foundries Co., Colonie, near Watervliet, N. Y., is inquiring for electric hoists and chain blocks. New York state makers of small brass castings have been good buyers of machine shop equipment.

An order for five electric traveling cranes, including one 20-ton, two 10-ton and two 5-ton cranes, for the Philadelphia navy yard, went to the Niles-Bement-Pond Co. This company also recently was awarded an order for 16 overhead cranes for the Baldwin Locomotive Works, Philadelphia. The Midvale Steel & Ordnance Co. has not yet closed for a 75-ton ladle crane and four 10-ton traveling cranes for its Johnstown, Pa., plant, or the one 40-ton crane for the same plant, or the one 40-ton crane for its Coatesville plant. The American Shell Co., Patterson, N. J., closed for one crane and the United States Cast Iron Pipe & Foundry Co. for one 30-ton crane. The largest list still pending is that of the American Locomotive Co. for 13 cranes. Bethlehem Steel Co. still is awaiting action on several cranes.

Many Small Cranes Wanted Near Pittsburgh

NUMEROUS inquiries still are coming out in the Pittsburgh district for cranes. The Weirton Steel Co., Weirton, W. Va., recently ordered a 5-ton standard

Champion crane and has put out an inquiry for a monorail hoist. The Union Switch & Signal Co., Swissdale, Pa., is seeking a 5-ton, 54-foot span crane and the Erie Foundry Co., Erie, Pa., seeks a 50-ton crane. The Donner Steel Co., Buffalo, which recently closed with the Alliance Machine Co., Alliance, O., for three cranes, two 20-ton and one 10-ton, now is in the market for a 5-ton crane. The Blaw-Knox Co. is in the market for another crane and inquiry also is out from the Diamond Alkali Co. for a crane. The Chicago Pneumatic Tool Co. recently placed orders for three Champion cranes for its Franklin, Pa., works, two 20-ton and one 15-ton. The Carnegie Steel Co. has closed with the Morgan Engineering Co., Alliance, O., on three cranes for its Edgar Thomson works, a 20-ton, a 50-ton and an 80-ton. Developments in connection with the rehabilitation of the Cambria Steel Co. plant at Johnstown, Pa., are expected before long. Several of the large crane manufacturers now have a good volume of business booked and are operating their plants on a much heavier scale than was the case recently.

Demands for machine tools steadily are expanding and some houses report August bookings to have been the best of any month since the signing of the armistice. A significant feature of the recent dealings has been the placing of orders for a couple of planers by the Pennsylvania railroad lines west. A number of inquiries have been put out by this railroad since the first of the year but actual orders have not been forthcoming. The Ward Tool & Forging Co., recently organized at Latrobe, Pa., and which soon will break ground for a new plant, will probably be in the market for a line of automatic machinery for making rivet sets, punches, dies, reamers, small tools, small forgings and automobile valves. Most of the manufacturers of tools are well booked and in a number of lines eight to 10 weeks are the best deliveries being promised.

Tool Business in Canada Improves Daily

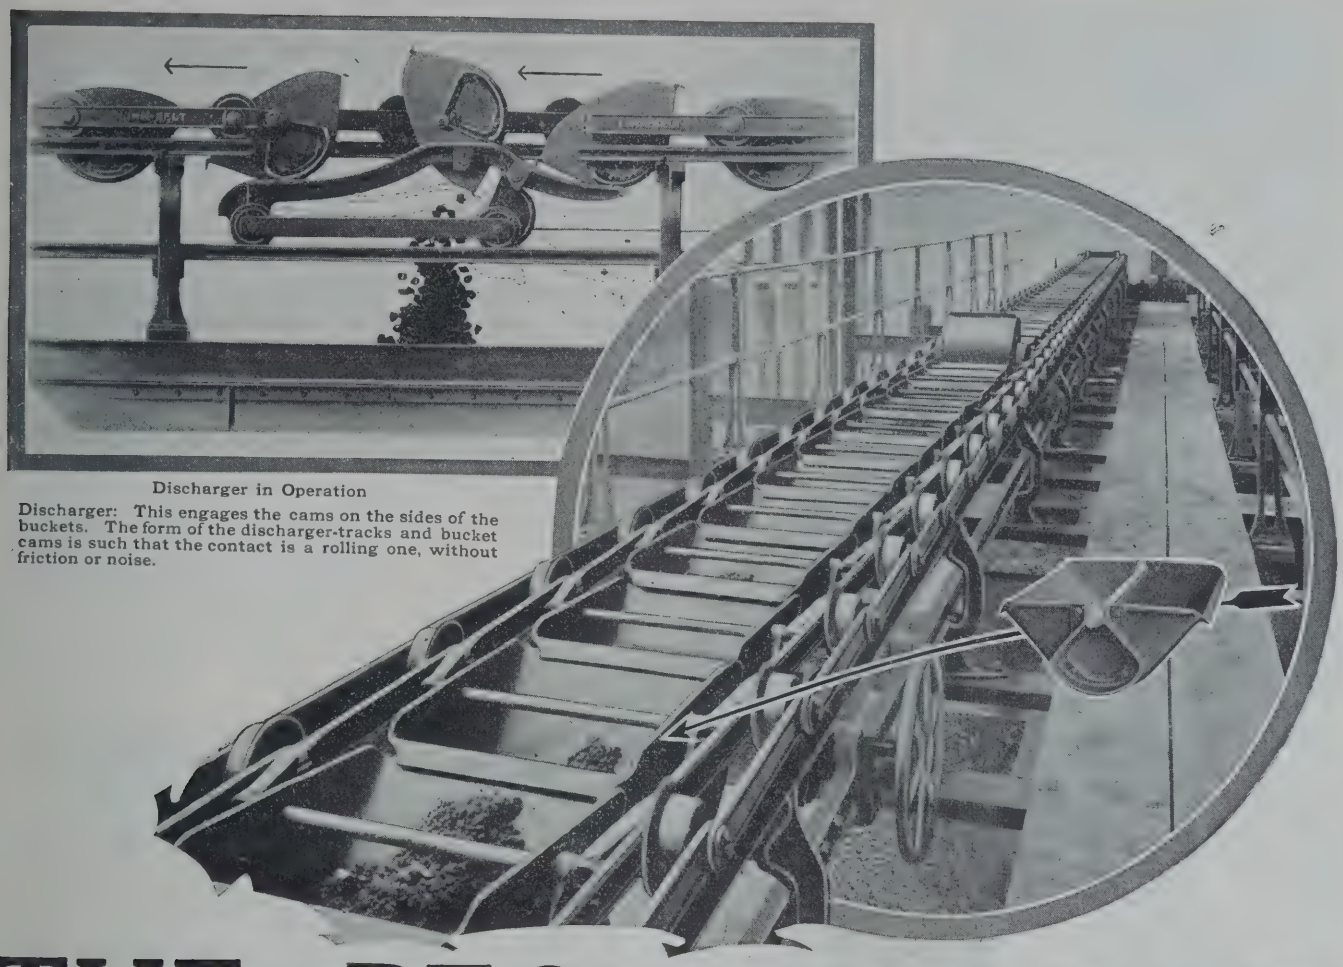
CANADIAN machinery dealers announce considerable activity in the equipment and machine tool trade, especially in Toronto and district, where the market is improving daily. Demands for motors are numerous, while there is a brisk movement in woodworking and mining machinery, tractors, etc. Automobile concerns continually are in the market for new equipment and dealers look for even more business from this source, when plants, which now are under construction in Ontario near completion. Dealers handling agricultural machinery and tractors report present buying far in excess of their expectations, and in some cases machines which were expected to keep the sales department busy until the first of the year have already been disposed of. A large number of inquiries are coming in for tool room equipment and in most cases new tools are wanted. Prospects in the dominion for increased business in machinery and tools also are on the increase. Word has been received at Ottawa, Ont., from Philippe Roy, commissioner general for Canada in Paris, France, that Captain Bisson, of the "Office de Reconstitution Industrielle des Departments Victimes de l'Invasion," 14 Rue de la Tremoille, Paris, would like to get into communication with Canadian manufacturers who are in a position to make prompt delivery of the following articles and prices at which they can be laid down there: Vertical lathes, milling machines, shaping machines, automatic lathes, machines for rolling mills, mortising (slotting), planing and boring machines, grinders, etc. In addition to this, inquiries have been received from Belgium, Russia, Australia, South Africa and a number of other countries for machinery, farm implements and other equipment.

Cleveland Dealers Busy Despite Labor Agitation

SUMMING up the condition of the machine tool business in Cleveland during the past week, several dealers report it as extremely satisfactory. Orders are received from widely distributed sources and from miscellaneous industries. General lines of equipment are being purchased, but most of the sales are light and small numerically. Inquiries are plentiful and a tendency to close quickly is noted. The aggregate of business transacted would be greater but for the labor situation. However, the present unsettled condition is treated more or less lightly by manufacturers who believe it to be but a passing phase, which will soon blow over.

Much business is current in Akron, O., and strikes and threats of strikes are militating against the efforts of dealers to obtain the orders. The Firestone Steel Products Co., that city, has not closed on its requirements which include six large boring mills. Action likewise is postponed on the large list issued by the B. F. Goodrich Co., Akron, and the Goodyear Tire & Rubber Co. is understood to be getting ready to close on about $75,000 worth of equipment. The Crescent Garage & Machine Co., Akron, which has contracted for about $50,000 worth of machines, including a 50 or 52-inch Le Blond engine lathe, has indicated its intention of buying $40,000 worth additional. Several other concerns in Akron are in the market for one or two machines to piece out their equipment. The J. V. B. Engine Co.,

Belgians Buy Machinery From Government-Owned Stocks



AID to devastated Belgium is being extended by the United States government in other ways than by large loans of money. Sales are being made from the government's huge stocks of war work machinery and three years credit is being extended. A recent article in *The Daily Iron Trade and Metal Market Report* follows:

A party of Belgians, members of Construction Metallique, is touring the United States taking steps toward the rehabilitation of districts devastated during the war. They are buying machinery from the United States government which had been used in war plants, and which they will utilize in reviving industries of Belgium. The visitors are being assisted by Lieut. E. P. Sykes, of the office of the director of sales, who is disposing of the equipment of the former war plants.

"These men represent all the industries in Belgium," Lieutenant Sykes said. "Their purpose in this visit is to buy machinery which will replace what the Germans destroyed. The Construction Metallique resembles the big holding companies of the United States. It will do all the buying for Belgian manufacturers.

"In order to evade the heavy discount the Belgians would have to stand if they paid immediately, the United States government is to take three-year notes. They will thus be able to start their factories, ship us goods, and restore exchange conditions to normal within a reasonable period.

"The purchases will amount to at least 3000 machines. They may buy more, as they need about 60,000. In addition they have made some private purchases."

Discharger in Operation

Discharger: This engages the cams on the sides of the buckets. The form of the discharger-tracks and bucket cams is such that the contact is a rolling one, without friction or noise.

THE PECK CARRIER

Is the recognized standard machine for handling coal and ashes in the modern boiler plant, for cement clinker, stone, etc.

FOLLOWING its record of service in Power House work, the Peck Carrier is even supplanting the older combinations of belt or screw conveyors and elevators for the more important duties in cement mills. Constructed as it is, with relatively few wearing parts and these of the best design to resist wear, the cost of maintenance and power is far less than with the types of conveyors replaced; but of even greater importance is its reliability and freedom from delays, which are always serious in a continuous process like the manufacture of cement. In this feature of reliability, the Peck Carrier is unrivaled. It is extensively used and is in increasing demand for handling rock, and hot and cold clinker, besides coal and ashes in power house.

We believe it will be but a short time before the use of this Carrier for all but very short conveyors—and in all cases where material has to be both conveyed and elevated—will be universal.

LINK-BELT

Elevators and Conveyors

Akron, was incorporated with $100,000 capital recently.

Several new inquiries of fair size are current in Cleveland. These include one from the American Borvist Co., Cleveland, which wants about 15 tools for general machine shop equipment; these will aggregate $25,000. The Columbia Axle Co., Cleveland, has issued an additional list comprising a number of lathes, shapers, etc., which will call for an expenditure of about $40,000. A new list of machinery requirements has been issued by the Burke Electric Co., Erie, Pa., covering approximately $7500 worth. The Parish & Bingham Co., Cleveland, which was an active buyer in Cleveland during August, wants two 16-inch Gould & Eberhardt shapers among other equipment. The General Supply & Machine Co., Meridian, Miss., is asking for an 18 or 20-inch screw cutting lathe with 6 or 8 feet between centers. The Newark Machine & Stamping Co., Newark, N. J., is in the market for a 42 x 36-inch x 12-foot planer. The National Acme Co., Cleveland, is understood to have closed on some equipment including a 26-inch Aurora lathe with sliding head. Considerable activity is noted among Detroit manufacturers and a large number of tools are being sold in that territory. The Cadillac Motor Car Co., Detroit, is one of the purchasers and among other machines, it has ordered two 12 x 18-inch drill presses.

The price situation remains fairly steady. Changes are being made but these represent adjustments more than real increases or reductions. Where a price was $6 high or $7 low, the odd dollars and cents would be dropped to equalize the price.

Prospective changes in automobile design give rise to expectations of additional tool requirements on the part of manufacturers. For instance, the Grant Motor Car Corp., Cleveland, has announced that its new 1920 design carries an entirely new hood and it will utilize the H. J. Walker Co.'s engine.

Expansion activity in various directions likewise presage heavy tool needs soon. Among the new companies soon to start operations is a $12,000,000 body corporation which will build in Cleveland. The Dalton Adding Machine Co., Cincinnati, will probably purchase additional equipment for a 4-story building, 60 x 160 feet, contract for which has been awarded. It is understood that the National Cash Register Co., Dayton, O., is to spend $1,000,000 on expansions. Heavy equipment will be purchased by the Lima Locomotive Works, Lima, O., which is enlarging its plant by several additions. The Standard Woodwork Co., 815 East Ninety-third street, Cleveland, will probably close on some woodworking equipment soon for the new plant it is erecting. The Worthington Pump & Machinery Co., Cincinnati, is enlarging its plant and the Acme Machine Tool Co., that city, is spending $18,000 for a 1-story addition.

Tractor Plant Tools Bought in Chicago

WHILE most buying in the Chicago field continues to be of small lots an occasional instance comes up where a larger purchase is made. One such has just been closed by the General Motors Corp. for the tractor plant of the Samson Tractor Works, Janesville, Wis., including about $75,000 worth of equipment. Other machinery will also be needed for this plant. Fire damaged the main machine shop of the Moline Plow Co., Moline, Ill., which will necessitate entire new equipment, totaling a large assortment. The list of these requirements is being prepared.

A scarcity of presses has developed recently, unusual demand having arisen on the part of many users. Sellers have a large number on back order and delivery is becoming slow. One reason for this is a series of strikes by molders which delays their manufacture. General buying keeps up at a high rate, mostly in small lots and single tools.

Much interest is manifested by dealers even as far west as Chicago in the sale by the American Can Co. of equipment in 12 buildings of its plant at Edgewater, N. J. This includes 1150 metalworking machine tools of various kinds, 300 motors and a large quantity of general equipment as noted in this column last week. Western machine tool builders are almost as busy as in war days and demand seems to be on the increase.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BOSTON.—Plans have been figured for a 1-story, 60 x 320-foot machine shop for the Compressed Steel Shafting Co.

BOSTON.—The J. T. B. Motor Co. has been incorporated to build gasoline engines with $100,000 capital, by B. L. Colpitts, Harry Bergson and James T. Bustin, Medford, Mass.

CAMBRIDGE, MASS.—The United Drug Co., Boston, has purchased land on which it is reported contemplating a building for the manufacture of hardware.

FITCHBURG, MASS.—The Hibbard Electric Co. has been incorporated to make electric appliances with $60,000 capital, by Walter L. Hibbard, N. M. Hibbard and Harry W. Conant, Somerville, Mass.

FRAMINGHAM, MASS.—Plans are being made by Monks & Johnson, Boston, engineers, for a 5-story, 70 x 200-foot plant for the Dennison Mfg. Co.

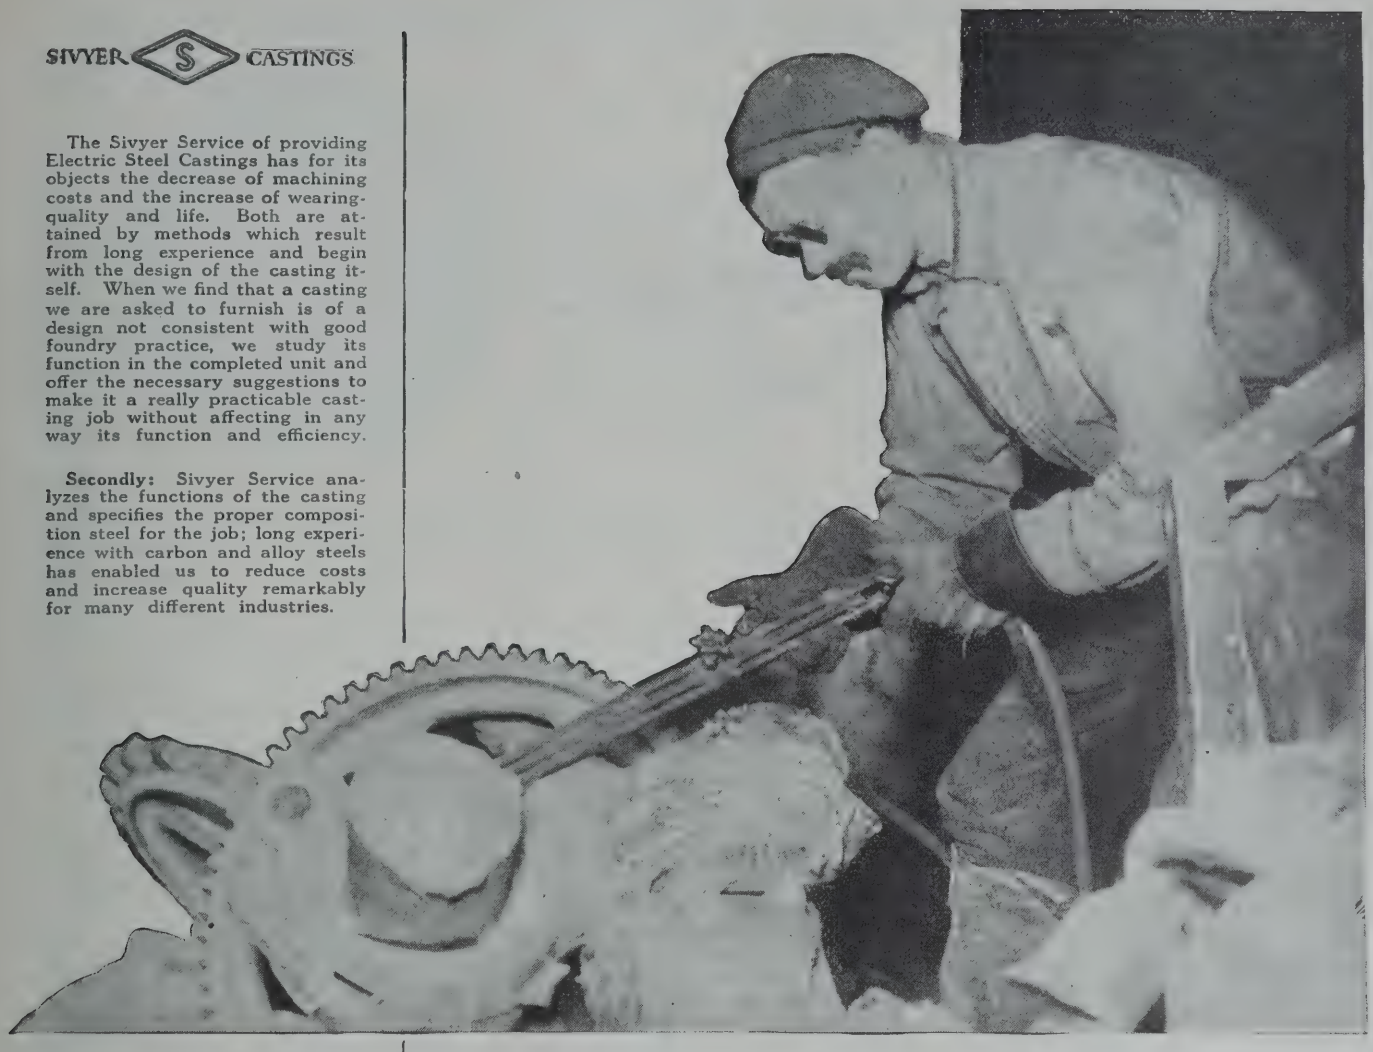
GARDNER, MASS.—The American Toy Mfg. Co. has been incorporated with $50,000 capital, by Charles A. Bryant and Emil Hendricson, both of Templeton, Mass., G. E. Sand and J. Franklin Wilkinson, Winchendon, Mass.

NEW BEDFORD, MASS.—Plans are being drawn by the J. G. White Engineering Corp., New York, for a power house for the National Spun Silk Co.

ORANGE, MASS.—The Judkins Textile Machine Co. has been incorporated to operate plants in Orange and Providence, R. I., with $50,000 capital, by W. K. Clark, Greenfield, Mass., Edward S. Judkins, East Providence, R. I., and George A. Dexter.

SPRINGFIELD, MASS.—Bids closed Aug. 25 for a 1-story, 50 x 120-foot plant for the Duckworth Chain & Mfg. Co.

SPRINGFIELD, MASS.—The Springfield Tool Co. has let the contract for a 2-story, 90 x 200-foot addition to cost $50,000.



SPRINGFIELD, MASS.—The Springfield Foundry Co. has let the contracts for two additions, 100 x 100 feet and 40 x 50 feet.

SPRINGFIELD, MASS.—The Package Machinery Co. has been incorporated with $3,000,000 capital to operate a machine shop, by William L. Putnam,

SIVYER S CASTINGS

The Sivyer Service of providing Electric Steel Castings has for its objects the decrease of machining costs and the increase of wearing-quality and life. Both are attained by methods which result from long experience and begin with the design of the casting itself. When we find that a casting we are asked to furnish is of a design not consistent with good foundry practice, we study its function in the completed unit and offer the necessary suggestions to make it a really practicable casting job without affecting in any way its function and efficiency.

Secondly: Sivyer Service analyzes the functions of the casting and specifies the proper composition steel for the job; long experience with carbon and alloy steels has enabled us to reduce costs and increase quality remarkably for many different industries.

Thirdly: Sivyer Service makes a careful study of the pattern and molding problems involved, for improper gating and insufficient risers are often the greatest wasters of machining labor and metal.

Fourthly: Sivyer Service analyzes carefully the proper annealing methods to be used and controls their proper application through unfailingly efficient equipment and men. In short, the Sivyer Service supervises every step necessary to secure unusually and unfailingly good castings of electric steel. It never relies on one factor alone, relies very little even on the natural freedom of electric steel from occluded gases and on its commonly recognized merit in resisting crystallization. It also depends but little on the inherent scientific accuracy of the electric furnace process. From casting-design to sand-blasting and tumbling, the fundamental superiority of Sivyer Steel is due to its men and metal. Their value is best proved by the fact that, although the production of steel castings is generally looked upon as a local one, the Sivyer market is national.

PROPER gating and ample risers do much toward insuring for Sivyer Steel Castings the sterling soundness necessary to keep machining costs low. But the right methods in getting rid of risers and gatings also have much to do with providing smooth clean castings. The use of oxy-acetylene torches for this purpose is, of course, common; we have found, however, the men who use the torches are quite as important as the equipment itself and have spared no pains to retain good workmen who have been familiar with Sivyer standards for years. The Sivyer men, even more than the Sivyer metal, have given to Sivyer Castings the high quality that has won them their national market.

SIVYER STEEL

SIVYER STEEL CASTING COMPANY, MILWAUKEE

Manchester, Mass., George W. Kyburg and Harvey H. Bundy.

PROVIDENCE, R. I.—The General Fire Extinguisher Co. has let a contract for a 4-story, 63 x 113-foot office building.

WOONSOCKET, R. I.—Bids have closed for a one and 2-story, 80 x 130-foot mill addition and a 40 x 40 foot boiler house, for the Gold Mark Knitting Co.

DANBURY, CONN.—Bids have closed for a 1-story, 90 x 150-foot machine shop to cost about $30,000, for Doran Bros.

HARTFORD, CONN.—The American Metal Sales Corp. has been incorporated with $25,000 capital, by Samuel P. Blakeman, John E. Lundquist and J. A. Wilmath.

NEW BRITAIN, CONN.—Bids close Sept. 1, for a 6-story, 80 x 160-foot, and a 1-story, 50 x 160-foot factory additions to cost about $225,000 for Landers, Frary & Clark.

North Atlantic States

BROOKLYN, N. Y.—Strober Bros., iron, steel, etc., has been incorporated with $20,000 capital, by M. S. and M. Strober, 120 Rutledge street.

BUFFALO.—The Art Metal Co., Erie, Pa., has let the contract for a 1-story addition, 120 x 166.

BUFFALO.—The Niagara Machine & Tool Co. plans a plant addition, one story, 75 x 180 feet and 90 x 100 feet.

BUFFALO.—The A. F. Oliver Gear Machine Co., 60 Cherry street, is having plans drawn for a plant, one story, 50 x 60 feet.

BUFFALO.—The Buffalo Foundry & Machine Co., 1543 Fillmore avenue, contemplates a foundry addition, at an estimated cost of $20,000.

BUFFALO.—The S-T Engineering Corp., machinery and mechanical devices, recently was incorporated with $100,000 capital, by W. B. Powell, H. H. Leonard and H. J. Turner.

BUFFALO.—The Milner Flower Electric Co., electrical machinery, has been incorporated with $30,000 active capital, by M. W. Bense, C. B. McBride and A. E. Moore, 37 Wall street, New York.

FALCONER, N. Y.—The Falconer Iron Works has let the contract for a 2-story addition 40 x 120 feet.

NEW YORK.—The Peerless Heater Co. recently was incorporated with $10,000 capital, by E. Steuer, Harrison N. Lipkermann, 92 Morningside avenue.

NEW YORK.—The Himoff Tobacco Machine Co., Inc., has been incorporated with $50,000 capital, by H. and R. and M. Himoff, 104 West 190th street.

NEW YORK.—The Improved Propeller Corp. has been incorporated with $150,000 capital, by J. Kunse, S. Ratajczm and W. Kedzierski, 42 Broadway

NEW YORK.—The Electric Keyless Lock Co. has been incorporated with $10,000 capital, by S. Greene, H. Gottesman and A. M. Block, Woolworth building.

NEW YORK.—S. Blickman, Inc., has been incorporated to make metal specialties with $500,000 capital, by S. M. and S. Blickman, 286 Ft. Washington avenue.

NEW YORK.—The Monarch Carburetor Lock Co. has been incorporated with $100,000 capital, by N. A. Unger, W. H. Rosenfeld and H. H. Walker, 140 Nassau street.

NEW YORK.—The Atlantic Adriatic Steamship Corp. has been incorporated with $100,000 capital, by V. S. Bendix, R. L. Lake and L. Acerstrom, 561 West 179th street.

NEW YORK.—The Highlands Navigation Corp. has been incorporated with $250,000 capital, by J. J. and D. F. McAllister and A. M. Clair, 103 Kent street, Brooklyn, N. Y.

NEW YORK.—The M. R. Shafter Co. has been incorporated with $20,000 capital to make automobile accessories, by M. R. and V. F. and B. J. Shafter, 3750 Broadway.

NEW YORK.—Kimelblatt, Ross & Sisti Co. has been organized to operate an ornamental iron works by Joseph Kimelblatt, Marco A. Sisti and M. J. Ross, Lynbrook, N. Y.

NEW YORK.—The General Metal Crafts Co. recently was incorporated with $100,000 capital, by J. Agazim, G. G. Greenburg and G. T. Cullen, 44 East Thirty-fourth street.

NEW YORK.—The Humil Corp., electrical apparatus, recently was incorporated with $300,000 capital, by J. Van Harder, H. H. Thurlow and F. D. Hagan, 55 Liberty street.

NEW YORK.—The Mutual Art Metal Works, Inc., has been incorporated to make metal novelties, with $10,000 capital, by H. and I. Mershon, and M. Rosenfield, 50 Cathedral Parkway.

NEW YORK.—The Brooklyn Ship Repair Corp. recently was incorporated with $750,000 capital, by T. Barth, Charles Karlson and Robert E. Shortell, View Court, Brighton Heights, N. Y.

NEW YORK.—Barbour, Love & Woodward, Inc., machinery, recently were incorporated with $100,000 capital, by R. L. Woodward, L. S. Love and J. W. Barbour, 1601 University avenue.

NEW YORK.—The Simplex Metal Spinning & Stamping Co. has been incorporated with $10,000 capital, by S. Silverstein, L. M. Murray and D. D. Shapiro, 1541 President street.

NEW YORK.—The Boyce Veeder Corp., fire extinguishers, has been incorporated with $75,000 active capital, by P. L. Veeder, H. H. Boyce and J. W. Truesdale, 259 East Eighty-second street.

NEW YORK.—The Metropolitan Chain Corp. has been incorporated to make chandelier and fixture chains with $5000 capital, by L. Kaplan, J. Mesnick and I. Freedman, 1791 Gleason avenue.

NEW YORK.—The Apex Specialties Corp. recently was incorporated with $20,000 capital to manufacture machinery tools, etc., by F. E. and C. Wocel and H. W. Benkman, 610 West 191st street.

NEW YORK.—J. S. Lawson & Co., Inc., has been incorporated with $10,000 capital to make machinery and hardware, by J. S. Lawson, J. A. Potter and A. D. Stanton, 416 West Thirty-third street.

NEW YORK.—The Portable Electric Current Co. has been incorporated with $2,000,000 capital, by W. A. Blank, 882 St. John's place, L. B. Kanter, 180 Thirteenth street, and C. B. Plante, 761 Lincoln place.

ROCHESTER, N. Y.—The General Railways Signal Co. plans a foundry addition, 110 x 220 feet.

ROCHESTER, N. Y.—The board of contract and supply has taken bids on the sewage disposal plant.

ROCHESTER, N. Y.—The Lisk Mfg. Co., 160 Fifth avenue, has plans for a power plant, 1-story, 63 x 87 feet.

ROCHESTER, N. Y.—The Harrison Radiator Corp. plans an addition, 1-story, 160 x 289 feet, to its plant at Lockport, N. Y.

ROCHESTER, N. Y.—The North East Electric Co., 348 Whitney street, plans a plant addition, 2-stories, 86 x 198 feet, to cost $60,000.

ROCHESTER, N. Y.—The Corporation Pattern Works, Inc., recently was incorporated with $5000 capital by G. J. Fink, W. H. and E. C. Kramer.

ROCHESTER, N. Y.—The Rochester Blower Pipe Co. recently was incorporated with $15,000 capital, by A. I. Bull, C. G. Diehl and F. J. Weinmann.

ROCHESTER, N. Y.—The Cellu Metal Corp. recently was incorporated with $150,000 capital, by A. B. Progin, W. Cheindia and F. C. Monkhouse.

SOUTH NEW BERLIN, N. Y.—The Bertholme Power Co. has been incorporated with $25,000 capital, by T. B. Parker, F. Van Valkenburg and E. W. Hovey.

SYRACUSE, N. Y.—The Syracuse Chilled Plow Co. has been incorporated with $300,000 capital, by C. A. Chase, W. W. Wiard and others.

SYRACUSE, N. Y.—The Brown, Lipe, Chapin Co., 110 Seneca street, manufacturer of gears, is reported having plans prepared for a 5-story plant, 70 x 78 feet.

UTICA, N. Y.—The Utica Heater Co. has plans for an addition, 1-story, to its plant at Whitesboro, N. Y.

UTICA, N. Y.—The Utica Knitting Co. has plans for a machine shop addition, 1-story, 60 x 69 feet, to cost $15,000.

WATERLOO, N. Y.—The Waterloo Wagon Co. is reported planning to build a plant for the manufacture of automobile and truck bodies.

WATERLOO, N. Y.—The Waterloo Body Corp. recently was incorporated with $200,000 capital, by T. E. Milliken, A. W. Frantz and J. Kropf.

ALLENTOWN, PA.—The Lehigh Chemical Co. recently was incorporated with $10,000 capital, by Stanley Staneslaus, Reading, Pa., A. Sofrancey and Lawrence H. Rupp.

FERNDALE, PA.—The Cambria Car & Foundry Co. has been incorporated with $5000 capital, by H. J. Widmann, Johnstown, Pa., and others.

MCKEESPORT, PA.—The National Tube Co. will start work soon on a plant at Christy park. Address Taylor Allderdice, second vice president, Frick building, Pittsburgh.

NEW CASTLE, PA.—J. C. Barr of the Pittsburgh Steel Co., Union Arcade, Pittsburgh, is interested in a steel plant to be erected at New Castle junction.

PHILADELPHIA.—The Philadelphia Metal Lathing & Furring Co. has been incorporated with $5000 capital, by M. H. Jester, John J. Baurer and E. W. Billerbeck.

PITTSBURGH.—The Pittsburgh Gauge & Supply Co. plans to erect a plant addition, to cost $350,000.

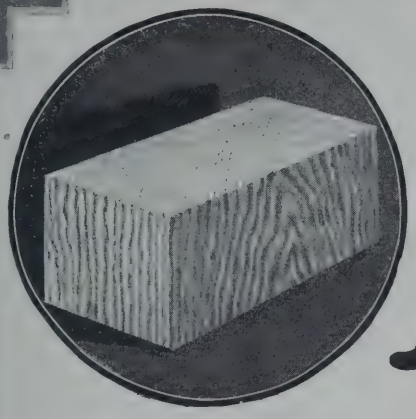
PITTSBURGH.—The Continental Steel & Supply Co. recently installed 29 nail machines at its plant at Ellwood City, Pa.

PITTSBURGH.—The Weinman Pump & Supply Co., capital $20,000, has been incorporated by C. E. Chalfant and others.

PITTSBURGH.—A charter has been granted to the Pittsburgh Forging Co., capital $5000. A. R. Bassett is among the incorporators.

PITTSBURGH.—Charter has been granted to the J. A. Malone Co., capital $35,000, iron and steel manufacturer. J. A. Malone is president.

PITTSBURGH.—The Standard Steel Products Co., recently incorporated, has acquired 15 acres at Coraopolis, Pa., as a site for a plant.



PITTSBURGH.—A charter has been granted to the Triangle Automobile Spring Co., capital $5000. A. R. Bernhardt, Pittsburgh, is an incorporator.

PITTSBURGH.—The Duquesne Light Co. proposes to spend $200,000 for a supply station. A. W. Thompson, 435 Sixth avenue, Pittsburgh, is president.

PITTSBURGH.—The Radner & Dinger Co., one of the city's pioneer concerns in the fabricating of sheet metals, has a factory location and will erect a plant.

PITTSBURGH.—A charter has been granted to the Factory Products Co., capital $50,000, manufacturer of engines. William W. Adams, Pittsburgh, is interested.

PITTSBURGH.—The Duff Mfg. Co. is constructing

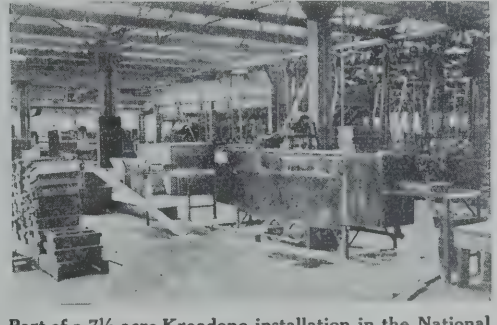
Kreodone EVERLASTING WOOD BLOCK FLOORS

are treated with Pure Creosote Oil

IT is significant that during the 22 years we have been making KREODONE Floor Blocks, *not one of the floors we have laid has worn out, decayed, bled smudge or tar, or broken down.*

Incidentally "once a user always a user" was never truer than as exemplified by the big KREODONE following—a host after 22 years. Users, old and new, keep coming back for more, again and again. They stay sold.

Truly a great record, which we point to with pardonable pride.



Our oldest floors are still in use and good for 22 years more.

Here's the conclusive proof that you need KREODONE floors in your plant if you want to cut upkeep expense and get more wear by many times than your present floors ever gave you.

We use nothing but seasoned, long-leaf yellow pine blocks, treated with the most efficient preservative known to science —*PURE Creosote Oil.*

Please note that we emphasize the word PURE. Pure creosote oil does not bleed tar or smudge out of treated floor blocks.

Our engineers will gladly survey your floors. No charge. Write.

Part of a 7½-acre Kreodone installation in the National Acme Co., Cleveland, Ohio, showing the conditions under which Kreodone Wood Block Floors serve best. Note the water on floor.

Get the *Genuine KREODONE* Blocks
Watch that Spelling—it means Service

an addition, 80 x 160 feet, which when completed will accommodate the forge shop and heat treating departments.

PITTSBURGH.—The building occupied by the Miller-Owen Electric Co., Lexington avenue and Thomas boulevard, recently was damaged by fire. Valuable electrical machinery, including dynamos and motors were damaged.

PORT BLANCHARD, PA.—The Ronna Coal Co. is reported planning to rebuild its coal washing plant.

POTTSTOWN, PA.—The Plastic Firebrick Co. has been incorporated with $25,000 capital, by John P. Oister, Frank T. Boyer, Elmer H. Gray and F. S. Yeager.

SHARON, PA.—This city is considering a sewage disposal plant.

SHARON, PA.—The Wilkes Rolling Mills Co. will build a sheet mill here.

SHARON, PA.—Nathan Rosenblum has awarded a contract to Wallis & Carley for a 4-story warehouse which will be equipped with elevators and gravity-controlled conveyors.

SHARON, PA.—The Slick-Knox Steel Co. will build a 2-story assembling plant, 150 x 300 feet, at Wheatland, Pa., and also will fit up a plant to make truck frames. C. K. Strasbaugh is president.

TACONY, PA.—The Dodge Steel Co. has awarded a contract to the Austin Co., Cleveland, for a steel foundry building.

TARENTUM, PA.—The Raydex Co. is making improvements to the old plant of the Northern Tool Forge Co.

VERONA, PA.—The Verona Steel Castings Co., a branch of the Standard Steel Car Co., has acquired nine acres near here, on which it is reported the company plans to build a new plant.

WASHINGTON, PA.—The Duncan Miller Glass Co. has let the contract for a gas producer plant.

WAYNESBORO, PA.—The Landis Tool Co. is reported planning plant extensions.

WEST NANTICOKE, PA.—Staple & Bell, Inc., plans to erect a coal breaker.

WILKES-BARRE, PA.—The Wilkes-Barre Iron & Wire Works Co. has been incorporated with $10,000 capital, by W. T. Ulrichson, Hugh P. Walters, Thomas H. Mead, Scranton, Pa., John R. Wilson and others.

WILLIAMSPORT, PA.—The Pennsylvania Collapsible Tube Co. has been granted a charter. It was capitalized at $25,000 and was incorporated by Harold A. Gilbert and others.

WRIGHTSVILLE, PA.—The Riverside Foundry Co. will build an addition 54 x 100 feet.

YARDLEY, PA.—The Keystone Screw Co., Philadelphia, has purchased the plant of the Klauder-Welden Co., which includes a modern foundry and machine shop.

YORK, PA.—The Read Machinery Co. contemplates a plant, one story, 160 x 240 feet, to cost $60,000.

CAMDEN, N. J.—The Penn State Auto Co. has been incorporated with $25,000 capital, by F. R. Hansel, I. C. Clow and J. A. McPeak.

JERSEY CITY, N. J.—The Auto Products Co. has been incorporated with $100,000 capital, by J. Hower, Peter Brance and J. P. Conlon.

LAMBERTVILLE, N. J.—Quirk Bros., New York, have decided to build a foundry at Phillipsburg, Pa.

MONTCLAIR, N. J.—The American Concrete Steel Co. will erect a 6-story warehouse for the E. E. Leach estate, to cost $150,000.

NEWARK, N. J.—The Heineman Phonograph Co. will shortly erect a 4-story factory building.

NEWARK, N. J.—The National Lock Washer Co., Herman street, is having plans drawn for a plant addition to cost about $20,000.

NEWARK, N. J.—The Dix Magneto Co. recently was incorporated with $25,000 capital, by J. P. Donohue, J. M. Maier and J. M. O'Neil.

NEWARK, N. J.—H. R. Friedman, Inc., 77 Arlington street, has been incorporated to manufacture notions, toys, etc., with $125,000 capital.

NEWARK, N. J.—The Metal Parts Co., 207 Market street, has been organized by John J. Turtletaub and others.

NEWARK, N. J.—Stengle & Rothchild, Main street, have awarded a contract for a boiler house, 1-story, to cost $16,000.

NEWARK, N. J.—The Aeolian Co. recently purchased 50 acres for the erection of a plant to cost about $2,000,000.

NEWARK, N. J.—The New Jersey Parts Co., manufacturer of shock absorbers, has leased a 2-story building.

NEWARK, N. J.—The Otis Elevator Co. has leased a building to be erected at 12 East Park street, to be 23 x 75 feet.

NEWARK, N. J.—The Metal Stamping & Mfg. Co. has been incorporated with $100,000 capital, by Harry Green, Sali Kneip and N. M. Frutchman.

NEWARK, N. J.—The Bachman Machine & Tool Mfg. Co., 130 Orchard street, has been organized by Carl Bachman, 38 Pennington street, and others.

NEWARK, N. J.—William E. Quimby, Inc., 209 Parkhurst street, pumping equipment, has plans for a 2-story addition, 48 x 92 feet, to cost $18,000.

NEWARK, N. J.—The Hillside Tool & Die Co. has been incorporated with $50,000 capital, by F. N. and S. L. Raymond and William S. Parsons.

NEWARK, N. J.—The Cocoanut Oil Co., New York, will erect a $300,000 plant, 110 x 200 feet, and the boiler plant will have 500 horsepower capacity.

NEWARK, N. J.—Amann & Finn, Inc., 557 Springfield avenue, have been incorporated with $50,000 capital to manufacture electric motors, dynamos, etc.

NEWARK, N. J.—The American Platinum Works, Oliver street, has awarded a general contract for an addition, 3-stories, 50 x 130 feet. The boiler house will be 25 x 40 feet.

NEWARK, N. J.—The contract for an additional unit to the Nutley plant of L. Sonneborn Sons, Inc., has been awarded and will be 1-story, 38 x 112 feet, with a boiler room extension 40 x 53 feet.

NEWARK, N. J.—Contracts for a $150,000 plant for the New Toy Co. were awarded recently. The building will be 2-stories with a floor capacity of 50,000 feet. A separate building of 2500 square feet will be used for mixing chemicals.

PHILLIPSBURG, N. J.—The Schedler-Murphy Iron & Steel Co. has been incorporated with $50,000 capital, by T. E. Murphy, Peter Schedler and others.

PISCATAWAYTOWN, N. J.—The Raritan Refining Co. will erect a plant.

TRENTON, N. J.—The Travelers Tire & Rubber Co. plans a plant and power house.

TRENTON, N. J.—The Standard Oil Co. will erect a repair shop, storeroom and general offices at an estimated cost of $200,000.

TRENTON, N. J.—The National Radiator Co. has plans for a core room and sand storage building, 1-story, 76 x 317 feet, to cost $30,000.

TRENTON, N. J.—William F. Lemon & Bros., Inc., has been incorporated to manufacture hardware, electrical supplies, etc., with $50,000 capital.

TRENTON, N. J.—The Ingersoll-Trenton Watch Co., 702 Monmouth street, has awarded a contract for a plant addition, 21 x 99 feet, to cost about $13,000.

TRENTON, N. J.—William F. Lemmon & Bro., Inc., capitalized at $50,000, recently was incorporated to manufacture hardware, by W. D. Lemmon, Edgar H. Freeman and others.

TRENTON, N. J.—The Hasselman-Powers Co., 26 West State street, has been incorporated with $125,000 capital to manufacture airplanes, automobiles, etc., by David L. Powers, F. G. Hasselman and J. Albert Homan.

WILMINGTON, DEL.—The Speakman Supply & Pipe Co., East Thirtieth and Spruce streets, will erect a plant addition, 60 x 180 feet.

BALTIMORE.—Sherwood Bros., manufacturers of oils and greases, whose plant was damaged by fire recently, announced that plans are under way to construct a modern plant.

Central States Activity

APPLETON, WIS.—Edward F. Witthuln, 984 Lake street, is forming a company to build an electric washing machine.

APPLETON, WIS.—The Northern Boiler & Structural Iron Works is completing work on a large plant addition and office building.

APPLETON, WIS.—The Langstadt & Meyer Co., electrical apparatus, is taking bids for a 2-story machine shop addition, 40 x 120 feet.

AUGUSTA, WIS.—The Dells Milling Co. is taking bids for a power dam.

BARTON, WIS.—The Stevenson Mfg. Co., general farm appliances, has let contracts for the first unit of its proposed plant to be 2-stories, 80 x 120 feet.

GREEN BAY, WIS.—The Wisconsin Public Service Co. is making preliminary surveys for a dam and hydroelectric plant at Johnson's Falls. The plant will cost about $500,000.

HORTONVILLE, WIS.—The Debareiner Hardware Co. is having plans prepared for a 1-story shop building, 60 x 120 feet, to be used as a machine shop and sheet metal works.

MENOMINEE, WIS.—The American Rule & Block Co. has been organized by Axel Thomsen, of Thomsen Bros. & Co., machinists.

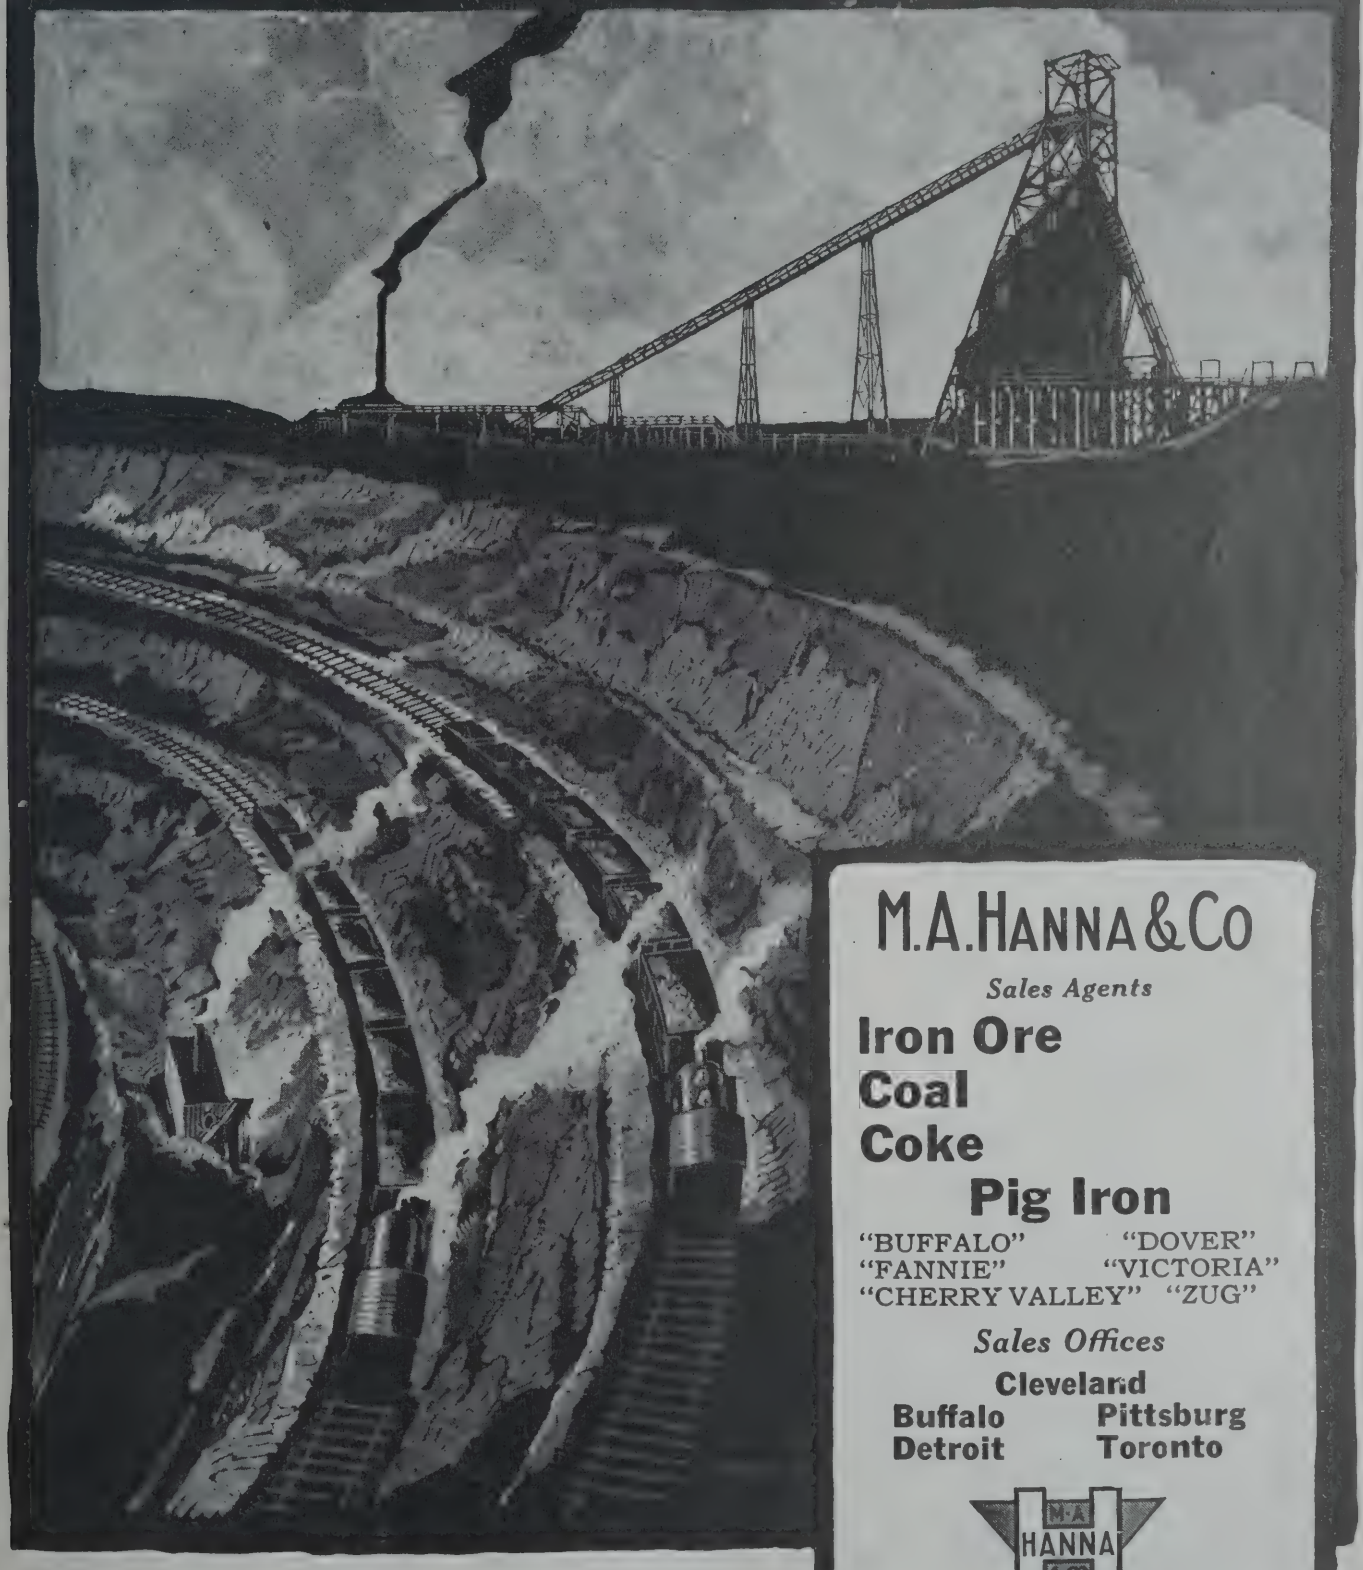
MILWAUKEE.—The Kearney & Trecker Co. is erecting a machine shop addition, 40 x 480 feet.

MILWAUKEE.—The E. & W. Mfg. Co., Oregon and Reed streets, will build a 2-story addition, 55 x 93 feet.

MILWAUKEE.—The A. E. Martin Foundry Co. recently awarded the A. F. Wagner Iron Works the contract to erect a gray iron foundry addition.

MILWAUKEE.—The Standard Steel Corp. has awarded the Northern Bridge & Iron Co. a contract to erect a machine shop and assembling floor.

MILWAUKEE.—The Monarch Tractor Co., Watertown, Wis., has been reorganized as the General Tractors, Inc., with headquarters at New York and Chicago.



MILWAUKEE.—The Ogren Motor Car Co., a new $500,000 corporation, has started work on rebuilding the former Elite rink, 120 x 150 feet, into an automobile manufacturing plant.

OSHKOSH, WIS.—The Bull Dog Tractor Co. has been organized with $750,000 capital, by J. H. Tritz, Eber Simpson and Arthur H. Gruenwald.

SHEBOYGAN, WIS.—Architects Childs & Smith, Chicago, have plans for the proposed Sheboygan high school, to be 3-stories, 162 x 195 feet, containing vocational training departments, etc.

TWO RIVERS, WIS.—Sam Schwartz & Son, scrap metal dealers, will award contracts shortly for a

(Concluded from Page 669)

BRANTFORD, ONT.—The Cockshutt Plow Co. will build additions to its plant at an estimated cost of $100,000.

BRANTFORD, ONT.—The Electric Tin Products Co. has purchased property here on which it plans a tin smelter.

BRANTFORD, ONT.—The Robbins & Myers Co., electric fan manufacturer, Springfield, O., is reported to have purchased a site here on which it plans a plant.

BROCKVILLE, ONT.—The Canadian Sander Mfg. Co. has been incorporated to manufacture machinery, etc., with $20,000 capital, by Arthur C. Jones, Ray L. Carter and J. Arthur Jones.

FOREST, ONT.—The city council is planning a waterworks plant.

GODERICH, ONT.—The Convertible Tractor Co., St. Paul, is making preparations for a plant here.

HAMILTON, ONT.—The Dominion Canners, Ltd., contemplate a $1,000,000 factory here.

KITCHENER, ONT.—The F. W. D. Auto Co. will start work soon on a plant here.

MORRISBURG, ONT.—Handley Page, Ltd., has been incorporated with $2,500,000 capital, to manufacture airplanes, etc., by William H. Workman, Mark Kerrm F. R. Chalmers and William H. McGannon.

OTTAWA, ONT.—Security Devices, Ltd., has been incorporated to manufacture safes, locks, tools, etc., with $25,000 capital, by O. G. Regan, F. W. Fee and G. A. Holland.

TORONTO, ONT.—The Northern Aluminum Co. is erecting a plant here.

TORONTO, ONT.—William and J. J. Greey are building a machine shop here, 98 x 180 feet, at an estimated cost of $50,000.

New Trade Publications

OIL HOLE COVERS.—Catalog No. 6 being circulated by W. W. & C. F. Tucker, Hartford, Conn., describes and illustrates oil hole covers and cups. Specifications and other data are given.

EXPORT SERVICE.—A small cardboard-bound booklet of 12 pages, entitled "Service," is being circulated by C. K. Thomas & Co., New York. The booklet points out the service on exports rendered by the company to its various clients.

ORE UNLOADERS.—The Wellman-Seaver-Morgan Co., Cleveland, has published a 12-page illustrated booklet in which it describes automatic ore unloaders which it has built and installed at various ports on the Great Lakes. The equipment is thoroughly described and numerous illustrations, showing various types of unloaders at work, are presented.

BOILER GRATES.—A 20-page booklet is being circulated by the Combustion Engineering Corp., New York, in which grates designed for hand firing boilers where automatic stokers cannot be installed are described and illustrated. A number of line drawings showing the elliptical air openings of dumping bars for various fuels are presented.

NONFERROUS METALS.—White & Bros., Inc., Philadelphia, are circulating a 24-page booklet pertaining to the manufacture of nonferrous metals. The latter part of the booklet is devoted to illustrations of various departments of the company's plant, and include the laboratory, the electrolytic table, a corner of the balance room, the copper warehouse and test departments.

BLOWERS.—The Buckeye Blower Co., Columbus, O., is circulating bulletin No. 10, which describes and illustrates multiblade fans for mechanical ventilation, forced or induced draft, mine ventilation, dry kiln where hot blast is used, waste heat installations of all kinds, mechanical systems where space is limited, and exhausters. Various data are given. A chart for determining frictional resistance or static pressure in inches, water gage, is given.

HAMMER DRILL.—A 4-page leaflet is being distributed to the trade by the Star Expansion Bolt Co., New York, in which a spring hammer drill is described and illustrated. This drill is adapted to the use of electricians, plumbers, etc., and is said to have a capacity for drilling 1 inch per minute in brick or concrete. The barrel of the drill contains a hammer or plunger which is thrown rapidly back and forth by the action of a cam and spiral spring, so that it strikes a series of blows on the drill point holder. The drill is operated by a hand crank.

SWING CUT-OFF SAWS.—A 4-page illustrated circular is being distributed by the Oliver Machinery Co., Grand Rapids, Mich., in which swing cut-off saws are described and illustrated. The frames of these saws are supported by trunnions which are independent of the countershafts. The frames are hung low from large screws, made adjutsable in the hangers by means of hand wheels. The saw arbors are mounted in separate yokes which are removable from the frames and which are held in finished slots securely bolted. The saw arbor bearings are automatically lubricated.

ENGINEERING.—Westinghouse Church Kerr & Co., Inc., engineers and constructors, New York, are circulating a 4-page leaflet containing a list of clients by whom the company was employed during 1918. According to the leaflet, the company served more than 40 clients during the year as engineers and constructors, and designed and built plans for the production of guns, shells, aircraft, turbines, high explosives, sulphur, brass and steel castings, forgings, carbide, leather, saws, lamp, superheaters, barrels, glass, railway shops and terminals, power plants, transmission lines, cantonments, loading plants, filtration plants, electric railways and workmen's houses.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

CO-OPERATIVE OFFICES

Cleveland, Chamber of Commerce; Cincinnati, Chamber of Commerce; Los Angeles, Chamber of Commerce; Philadelphia, Chamber of Commerce; Portland, Oreg. Chamber of Commerce; Dayton, Ohio, Chamber of Commerce; Pittsburgh, Chamber of Commerce

The purchase of automatic scales for weighing beet sugar and other machinery for a modern beet sugar plant is desired by a firm in Spain. Correspondence should be in Spanish. Opportunity No. 30364.

An agency is desired by a man in Italy for the sale of raw materials for the paper industry, including machinery. Correspondence should be in French or Italian. Opportunity No. 30365.

An agency is desired by a party in Italy for the sale of chemicals, leather, agricultural implements, etc. Correspondence should be in Italian. Opportunity No. 30379.

A commercial engineer in Belgium wishes to represent firms for the sale of metal products, sheets, bars, beams, forgings, tubes, copper and brass in sheets, bars and tubes, etc. Opportunity No .30380.

A firm in Trieste desires to purchase and secure an agency on a commission basis, for gas, water, and electrical appliances, sanitary goods and hardware in general. Opportunity. No. 30381.

A party in Italy desires to secure an agency for the sale of insulating material, slag-wool, asbestos, metals, iron, steel, etc. Correspondence should be in French or Italian. Opportunity No. 30383.

The purchase of steel shipbuilding machinery, second hand preferred, is desired by a party in Canada. Opportunity No. 30385.

An agency is desired by a party in Argentina for the sale of galvanized oval steel fence wire, and galvanized steel barbed wire. Opportunity No. 30387.

The purchase of metals, tubes, bars, sheets, marine hardware, piston rings, etc., is desired by a firm in Spain. Opportunity No. 30218.

Agencies are desired by a society in Belgium for the sale of machine tools for metals and wood, drill presses, lathes, etc. Opportunity No. 30220.

The purchase is desired by a firm in Spain of borers, drills, punches, lathes, files, machinery and other equipment, including mining and transmission machinery. Opportunity No. 3022.

The president of a commercial firm in China, now in this country, desires to purchase and secure an agency for the sale of penknives, machinery for making envelopes, typewriters, etc. Opportunity No. 30420.

A firm located in the Red Sea district desires to receive catalogs of simple models of pumps for raising water from streams or wells, 30 to 50 feet deep, iron pipes of small and medium size, as well as telephones, wire and other equipment. Opportunity No. 30424.

A company in Belgium seeks the representation of a firm manufacturing electrical installations, electric motors and accessories. Correspondence should be in French. Opportunity No. 30425.

Hardware and general merchandise in similar lines are required by a party in France. Opportunity No. 30426.

An American who is established in France desires to secure agencies for the sale of steel and steel products, such as wheels, tires, axles, forgings, castings and bar and sheet steel. Opportunity No. 30429.

A party in Algeria wishes to secure an agency for the sale of electrical equipment, motors, accessories, dynamos, etc. Correspondence should be in French. Opportunity No. 30430.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, September 11, 1919 *No. 11*

Strike Talk Still Fails to Excite

Iron and Steel Industry More Concerned With Getting Out Tonnage to Meet Growing Obligations Than With Unionism Threats—Much New Business Being Passed—Foreign Orders Are Heavier—Steel Output Gains

NOTHING in the week's events has modified the refusal of the iron and steel industry to become excited over the prospect of anything resembling serious strike troubles. The Gompers' message to the President is looked upon largely as an incident in a widely-staged propaganda to impress the employers, the 85 to 90 per cent of the workmen in the plants who have refused to affiliate with the newly-formed unions and the public. There is a well-defined suspicion also that it may have afforded a way for the more conservative labor leaders to redress an awkward position produced by the impossible claims and threats of radical agitators on which a showdown is overdue and to merge the matter with the approaching conference on general labor questions already called by the President. Just now the troubles of the industry have more to do with getting out tonnage to meet current demands than with controversies over unionism.

There are various indications that consumption of steel in a number of finished lines is running considerably ahead of production with the latter held back from capacity tonnage by labor shortages and other operating difficulties. Car shortages also are a factor. The notable instances of this are wire products, tubular goods, sheets, tin plate and bars. Specifications in all these products are ahead of output with the result that buyers are exerting increasing pressure and are encountering greater difficulties in getting desired deliveries. New orders, some of them very attractive, for delivery this year are being declined. Pipe line inquiries aggregate several thousand miles. An unsatisfied tin plate inquiry calls for 200,000 boxes.

Steel Output Increases

Despite any drag on finishing operations, crude steel output is working up steadily. August yield of the works was at the annual rate of over 38,500,000 tons of ingots or more than 3,300,000 tons in excess of July, and represented 85 per cent of the record period of October, 1918. Ingot production in 1919 to date amounts to 86.4 per cent of the 1918 figures for the same period.

The recent invoking of the federal anti-dumping statute by domestic producers against English makers of ferromanganese has caused the latter to withdraw their low prices of $95 and $100 seaboard. In some cases sales at the complained-of prices have been suspended.

Export Sales Pick Up

Export sales of iron and steel again are on the upgrade after the sharp slump in July revealed by the government figures just published. China and Japan again are in the market liberally and South America continues an active customer. European demand is light excepting Spain which has been taking the advantage of exchange in its favor to buy American steel and resell it to nearby countries. The heaviest week's sales reported include 10,000 tons of ship plates and two lots of 24,000 boxes and 5000 boxes of tin plate to Japan; 10,000 boxes of tin plate to China; 7000 boxes of tin plate and 1000 tons of galvanized sheets to Spain; 9000 tons of steel bars to Argentine; 6000 tons of wire to Cuba and South America, and 15,000 boxes of tin plate to Chile. A 20,000-ton billet sale is held up at Chicago by the exchange situation. It is estimated that recent export sales have easily been from 10 to 15 per cent of mill output. A leading Pittsburgh independent as the result of heavy foreign bookings advanced its export figures on all products this week $3 to $5 per ton.

A good index to the general and diversified character of present distribution is the surprisingly large percentage of material that is passing into use through the jobbers.

Report Big Iron Sale

There is a report in Chicago that a large buyer in that territory has closed for 100,000 tons of malleable and 100,000 tons of foundry iron for 1920 delivery at this year's prices, but definite information of any such transaction is lacking. While many buyers are seeking to cover for next year, the general opinion of producers continues to be that it is not wise to sell so far ahead at this time and the run of sales is light.

Gompers Plays A Bold Hand

SAMUEL GOMPERS' telegram to President Wilson, suave in tone yet intimidating in effect, urging the latter to use his good offices to induce the Steel corporation to grant a conference to the representatives of the so-called organized workers of the steel industry purely is for public consumption. It is a mixture of the same exaggeration, untruthfulness and downright bluff which has characterized the present movement engineered by labor agitators to force a recognition of the union by the iron and steel industry. It is an effort to bring about through the intervention of the government or rather through the federal administration that which the newly-fledged unions are not able to accomplish through their own strength or efforts. In that respect it is an admission of weakness. Nobody knows more surely than Gompers and his associates that they have been talking in big figures but that the numbers of their claims largely are made up of ciphers. They know that if they attempt to call a strike that the effects would be insignificant in direct proportion to the strength of their membership. This is because their extended expenditure of time and effort and no little money over a period of months has brought comparatively few recruits to the ranks of organized labor in the industry and these largely from the foreign and more ignorant classes. As stated in a recent issue of THE IRON TRADE REVIEW on high authority, a complete canvass of the iron and steel industry shows that but 10 to 15 per cent of its employes at most have accepted union membership and these chiefly in the auxiliary trades such as machinists, carpenters, bricklayers, etc. These figures are eloquent of the right of the American Federation of Labor to speak for the hundreds of thousands of employes of the iron and steel industry or to invoke the aid of the President, directly or indirectly, to the furtherance of its cause. The American iron and steel industry is open shop because the rank and file of its employes want it to be open shop.

The inference is plain that the unions having failed to intimidate the manufacturers by their claims of strength or to force the latter into a conference which could be tantamount to a recognition, now are playing their last card. There is only one real end for which the American Federation of Labor is striving in this controversy and that is the recognition of the union. All the other items enumerated in the original set of demands are of so trivial or general a character that they assume the ridiculous when it is considered that in behalf of these the agitators would essay a strike which on their own words "would paralyze industry" and create an "industrial crisis." These demands have been put forth to give numbers to the alleged grievances and to lend a semblance of reason to the unions' cause in the public mind which is little informed regarding the actual conditions of employment in the steel industry. They mean literally nothing in themselves. All are subordinated to the one aim that unionism shall gain a footing and a recognition in the iron and steel industry, something which it has never been able to do. If they can maneuver it by fair means or foul to gain a seat at the table with Judge Gary and other leaders of the steel industry, the presidents of the various unions claiming a voice, undoubtedly would consider that they had won a real victory, not to speak of their having saved their faces. And undoubtedly they would be able to put the fact to good effect in the future in their mischievous endeavors to embarrass the country's premier branch of enterprise.

The union leaders have carefully refrained at any time from any statements which would disclose their exact membership in the iron and steel industry. It is clear that if they had the right to speak for the majority of the industry, or even for a large proportion of it, that the leaders of the steel industry being men of common sense and of business judgment, scarcely would decline to give them a hearing on the basis of any actual or imagined grievance. However, they speak only for a small

faction of the industry which they have been able to entice into membership by various methods in recent months.

There is no clearer case of the autocracy of organized labor than the threats of the decided minority against the steel industry, no more offensive assumption of arrogant privilege than Gompers' message to the President. It is inconceivable that the President of the United States, chief advocate as he is, of the self-determination of peoples and classes should allow himself to become the tool, consciously or unconsciously, for the propagation of unionism where it is wanted neither by employer or employed. If the President should yield to Gompers' blandishments or threats, however, it is to be hoped that the steel industry's reply will be direct and to the point. The industry has the strongest kind of a case and it owes it to the country in these days of unsettlement and the pursuit of false standards, to talk straight and vigorously. The President manifestly would need the real facts and the public would welcome them.

Europe's Food Supply and Steel

ACCORDING to the more recent reports from France some progress is being made in coping with the high cost of living. The French have been suffering extremely but their condition has been not much different from that of all Europe. These "hard times" abroad have been of the greatest detriment to the restoration of normality in foreign trade and of no little influence upon the sales abroad of American iron and steel. The news that an abatement is in sight, that Europe is at last beginning to see the return of better times, the forerunner of normal conditions, spells confidence and security to American industry.

For the United States there is a most intimate relation between the European food crop and the American iron and steel industry. It does not appear as yet that Europe will harvest a crop in 1919 sufficiently large to meet all needs. That is due to the long drawn out negotiations over the peace treaty and the necessity of retaining many thousands of men under arms. Good progress has been made, notwithstanding but it has been a strain. Next year the Europeans will be able to feed themselves much better and they will have time to think of something other than the bare necessity of obtaining essential raw products and instruments of production. Once a good crop is harvested, the Europeans will have the inclination to turn to improvements, betterments and extensions.

The American iron and steel industry has no reason to feel uneasy over the trade conditions in the ex-belligerent countries. European food crops will remove the most serious of the difficulties in trade now encountered in making sales to that continent.

Building Plants in the Open

AMERICAN manufacturers have gained an enviable reputation for boldly striking out from the beaten path of precedent when they believe that advantages will be derived from such action. This is proved in an impressive manner by the growing tendency to build new industrial plants in the thinly-populated areas on the outskirts of cities rather than in the congested districts.

With few exceptions most of the industrial plants erected during the past few years have been built several miles out from the congested districts of the cities in which they are located. This tendency has resulted in the rapid growth of new manufacturing centers of a distinctly different type from those which in earlier years grew up in the centers of many American cities. As a rule, the new structures have been built in cities where a large amount of excess land was available for future extensions. On account of the thinly-settled districts surrounding these industrial centers, a number of the more progressive companies were able to build up communities for their workmen. In cases where this was true, engineers were given full opportunity to develop model communities conforming with the latest ideas for the happiness and comfort of employes. Moreover, the shift in location of the nation's industrial works, automatically relieves the congestion of railway tracks and structures in the already-crowded portions of large cities. Everyone realizes that any development which tends to eliminate the necessity of directing bulk shipments of freight through the downtown section is to be encouraged.

Another result of the new policy regarding the location of industrial plants is the wider opportunity given engineers for designing plants better fitted to provide adequate lighting, heating and ventilation for workers. Instead of the multi-story structures frequently found in the congested districts, the new plants in the outlying sections of the city usually are of the single story type covering large areas. This design is preferable to the other from the standpoint of the worker. Moreover on account of the large amount of space available, employers are able to provide recreation features not possible in plants situated in close quarters. The increasing number of important manufacturers who are building large plants outside the city limits indicates that the days of the old industrial works, huddled together on a small area are numbered.

Big Iron Sale for 1920 is Reported

Chicago Hears 100,000 Tons of Malleable and 100,000 Tons of Foundry Have Been Taken at This Year's Prices—Definite Information Lacking—Furnaces Still Discourage Much Buying After Jan. 1—Silveries Advanced

Chicago, Sept. 9.—A sale of 100,000 tons each of foundry and malleable pig iron for first half delivery is said to have been closed recently in this district, at the price prevailing for delivery this year. Selling of a tonnage anywhere approaching this total at the present price would indicate a desire on the part of the seller to create a backlog early and willingness to resume considerable obligation during next year at the present level of prices. Inquiry at present is somewhat slack and consists mostly of 100-ton lots to fill in special grades by melters who have sufficient iron for their ordinary needs. Inquiry for 1920 delivery is somewhat better. One melter asks prices on 500 tons of foundry for first half and a sale of 500 tons of foundry for first quarter was made recently. An automobile maker in Indiana has requested that all its remaining last half tonnage be shipped at once, indicating a desire to get its iron under cover as soon as possible. Requests for anticipation of shipments are not uncommon. Many buyers are taking lots from their regular sources of 200 to 500 tons without making inquiry. A sale of 1500 tons of low phosphorus iron was made recently to a steel foundry. The situation in the silvery market is peculiar and interesting. The only furnace in the Jackson county sector now able to ship silveries is quoting a schedule of $2.75 over the former price, naming $39.50 at the furnace for 6 per cent and $47, furnace, for 10 per cent. The freight rate to Chicago is $3.80. A Tennessee stack is quoting $41.75, furnace, for 6 per cent, and $49.75 for 10 per cent, with $3.40 freight to Chicago, and has made sales at that figure. Production of silvery iron in the Chicago district may be undertaken within a short time to fill the demand which melters at present find they cannot do from ordinary sources. In addition to this, it is understood the strike in Jackson county is practically settled and that the three interests producing silvery iron there may resume within a short time. Full production in the Chicago district will be a fact within a short time. The idle stack of the Federal Furnace Co., South Chicago, will be blown in next week, and the stack of the Iroquois Iron Co., South Chicago, now being rebuilt, will be ready for operation the first week in December. This will place everything in this district in full activity. Southern iron continues to be practically excluded from this market. Because of the continued operation of northern stacks during the slack season early in 1919 however an excess of iron was produced which is serving to fill the deficit that would have arisen from lack of southern iron. Some additional sales of Canadian iron from the Soo are being made. Some foundries are taking that iron containing an excess of sulphur at regular prices to use instead of cast scrap.

Take More 1920 Business

Boston, Sept. 8.—One furnace after another has opened its books for a small sale of 1920 pig iron, and then after selling several thousand tons, has closed them again. Twice a Buffalo interest has offered limited tonnages for first half, and twice has withdrawn from the market. The Bethlehem Steel Co. has been selling 1920 iron here during the past week and other furnaces also have taken some business. On the whole, however, any iron for 1920 delivery is hard to obtain, and the majority of the furnaces are refusing to quote. A lot of 600 tons of 2X eastern (2.25 to 2.75 silicon) was sold to an eastern Massachusetts textile manufacturer for first-quarter delivery at $29, Buffalo. Two hundred and fifty tons of the same grade for the same delivery sold at a delivered price of above $33, which indicates a spread of over $1 in the first-quarter trading. The week's sales handled by Boston sellers were about in line with the general average established throughout the summer, but this was made up almost entirely of small tonnages. The 1920 sales did not exceed 2000 tons. Deliveries on all existing contracts for the present quarter are reported as excellent. Reports from foundries are universally favorable, many having to turn down business, and not a few working night shifts. Some foundries for the first time in their history, are sending work to outside concerns. The general impression is that in spite of this activity, the present requirements for pig iron are reasonably well cared for, and that the only large business which can be looked for, is that for first half or first quarter delivery. One Massachusetts machine tool manufacturer is asking for 500 tons for last quarter and several smaller inquiries are circulating. A rumor persists that a large consumer is on the point of placing an exceptionally heavy order extending well up in the thousands of tons. A Rhode Island consumer is asking for 400 tons for immediate delivery. The estimated total of sales for the past week through Boston sellers is 6500 tons.

Fill-in Orders Prevail

New York, Sept. 9.—Some pig iron

consumers are coming into the market almost daily for such fill-in tonnages as they are able to plan for definitely, and the general run of these tonnages are foundry grades, with some malleable and charcoal interspersed. Shipments are going forward with regularity and furnaces find the car supply adequate as a general thing. No unusual volume of inquiry is appearing, but there is a fair sprinkling for delivery this year, as compared with the far more prevalent requests for next year's delivery. Sales have not been active the past week, and one large furnace interest estimates its sales for the week aggregated about 3000 tons, mostly foundry grades. However, an eastern Pennsylvania foundry interest has been able to close for 2000 tons of No. 2X (2.25 to 2.75 silicon) at a shade less than $29 delivered.

Basic Iron Prices Unsteady

Pittsburgh, Sept. 9.—Efforts to sustain the market here on basic pig iron at $25.75 furnace, are not particularly successful. One large merchant interest here, which in the past few months claims to have booked about 100,000 tons of this grade and in the past fortnight or so to have taken several thousand tons, does not deny that some price concessions have been made in obtaining this business. The sales by this company have been widely scattered among steel manufacturers in the Ohio valley and the Youngstown and Pittsburgh districts and while nothing official is disclosed as to prices, the common assumption is that freights were absorbed by the seller. In some cases it is understood trade deals were made. These sales have practically filled up all the important buyers of basic pig iron and current demands are few and small. Demand for bessemer iron also is sporadic and comes chiefly from the steel foundries. Even foundry and malleable grades now are not being inquired for as freely as they were a short time ago. Most consumers are well filled up for the present. A sale of 500 tons of malleable for last quarter shipment is noted at $27.25 furnace, while a smaller tonnage and for immediate shipment was sold at $27.75. The general asking price on No. 2 foundry (1.75 to 2.25 silicon) is $27.25 furnace and small sales for prompt shipment are noted at that price. Small sales of No. 2X foundry (2.25 to 2.75 silicon) for prompt shipment also are noted at a premium of 50 cents a ton above the regular market base of $28.50 furnace. The market appears to be in considerably better shape on foundry and malleable grades than it does on steelmaking iron. It is understood that a valley furnace which has been making bessemer and steelmaking grades for the next few months will make malleable and foundry because of the better market in those grades. The Claire furnace, Sharpsville, Pa., will be lighted this week, leaving only one merchant furnace in that district on the inactive list. This is the Ella furnace, West Middlesex, Pa. Sales of low phosphorus pig iron are few and the only transaction of any account recently made was one of 300 tons to a Pittsburgh district consumer at about $40 delivered Pittsburgh. About 1800 tons of low phosphorus recently sold at Burnham, Pa., by the government has been resold in this district.

Production is Main Thought

Philadelphia, Sept. 9.—Pig iron trade activities in the East seem to have settled down to continued determined effort to get out production necessary to fill comfortable total of orders on books of furnace companies. New sales in past week have aggregated comparatively smaller totals than in week previous and these involved mostly foundry, malleable and charcoal grades. The largest single tonnage sold was 2000 tons of No. 2X (2.25 to 2.75 silicon of which 500 tons was for prompt delivery to an eastern Pennsylvania foundry and machine shop and the remainder to be delivered through the year. Seller was important Philadelphia district producer, the delivered price being slightly under $29. Most Philadelphia sellers admit market is unusually quiet and ascribe it to pending labor activities which they hope will reach definite climax in next 10 days. Several sales of carloads up to several hundred tons of foundry iron have been made at the market which sellers seem willing to hold down to around $30, furnace. The Baltimore & Ohio railroad inquires for several hundred tons of foundry and about 100 tons of charcoal iron but general inquiry also is quiet especially for this year and producers are loathe to quote for next year until better apprised of new costs. While practically all Virginia furnaces are out of this year's market with possibly one exception, this seller is confirming itself to delivery only within next 60 days. and is getting from western users for mixtures, price equivalent to $32, furnace, for higher silicons. So far this month this maker has booked several thousand tons of this business ascribing reason to scarcity of higher silicons in Middle West. Delaware river soil pipe makers are growing busier through building revivals. No new business has developed in low phosphorus and both basic and bessemer grades are slow. The Alan Wood Iron & Steel Co. will blow in one Ivy Rock stack this week on foundry making two active, and the Muirkirk furnace, which now is in new Baltimore hands, was relighted yesterday for new campaign on charcoal.

Selling Small Lots for 1920

Buffalo, Sept. 9.—Moderate tonnages of iron were sold in this market last week. Certain old contracts were wound up, and some iron taken for next year. Producers are gradually getting around to quoting for next year's delivery, despite the fact that they are not very strongly in the market. Demand is good, particularly for 1920 iron, and if cost bases were more certain, there is no doubt a good buying movement would take place. In view of existing conditions, producers are not pushing 1920 iron.

New Business is Light

Cleveland, Sept. 9.—New business in the Cleveland district is comparatively light due to the fact that most of the uncovered requirement applies to deliveries after the first of the year, and producers are not encouraging buying for that period at this time. Nevertheless, some producers continue willing to accommodate regular customers for next year's iron when there is a good reason for doing so and are accepting this business at no advances over the present scale of $26.75 furnace for 1.75 to 2.25 silicon. One seller reports bookings in the week of 7000 to 8000 tons including 2000 tons of off iron, a considerable portion of which was for next year under these conditions. Local furnaces continue to make scattered sales, usually for filling-in purposes and of light tonnage to consumers who have underestimated their needs for this year and they are having no trouble in obtaining their advanced price of $26.75 furnace for the base grade on this business. One sale of 1000 tons of foundry iron to a local buyer who it is understood took this lot with the idea of carrying a portion of it over into next year was closed recently. Some of the furnaces to restrain speculative buying at this time have inserted a clause in their contracts, reserving the privilege to revise prices on the unshipped tonnage as of Jan. 1, to the then prevailing market.

Stovemakers Buy for 1920

Cincinnati, Sept. 8.—Stove foundries have bought considerable southern foundry iron for this year's shipment, and it is rumored that most of this iron brought $27.75 for 1.75 to 2.25 silicon, Birmingham. As most of these melters already had considerable iron on hand or ordered, it is presumed that they intend to carry the metal over into next year. Southern furnaces are still backward in opening their books either for the first quarter or the first half. A small tonnage of northern foundry iron has been booked on a basis of $28.75, Ironton, for first quarter delivery. Other small sales were made at $29. While there are well-substantiated reports that some of the lakes furnaces have been taking on a little first half business at $26.75, furnace, it is understood that this iron only went to favored customers, and that practically none now may be had at that price.

Good Demand at St. Louis

St. Louis, Sept. 6.—The demand for all grades of pig iron is decidedly brisk, with prices strong and tending upward. There is relatively little iron available in the South, and northern furnaces are entirely sold out, so far as their quotas for this district are concerned. The largest demands are coming from the foundries, which are working at capacity and using up more material than they had contracted for. New business is pouring in upon both merchant foundries and manufacturers of specialties, and a number of them are finding it difficult to secure additional tonnages of raw material. Actual sales are larger than inquiries. Sales during the week totaled between 6000 and 10,000 tons, mainly foundry iron. There is considerable complaint relative to deliveries, but railroad officials see little hope of relief until after the crops have been moved. Low-grade iron and grades with a

high percentage of silicon are scarce. Silveries are virtually unobtainable, even when premiums are offered. One firm reported the sale of 1000 tons of iron, 4 to 9 per cent silicon, at $3.25 higher than the last preceding transaction. Stove plants have been trying unsuccessfully to secure sizable tonnages of low-grade foundry. So far as can be learned the furnaces serving this district are entirely out of that material.

Southern Market Steady

Birmingham, Ala., Sept. 9.—The pig iron market in the South has settled down to a steady pace. The principal obstacle in the situation is the car shortage, which is interfering with deliveries. Production is improving, and it is estimated conservatively that the output for the last half of the year will exceed 1,000,000 tons. With 990,122 tons of iron officially credited to this state for the first half, the year's output may go above 2,000,000 tons. Sellers still have not admitted sales for delivery during 1920, though furnace interests say they could take on a large tonnage for next year's delivery if they desired. No price has been fixed on 1920 business. Representatives of furnace companies are in Washington seeking better transportation service.

Ore Movement

Retarded to Some Extent by Coal Strike—Market Inactive

Cleveland, Sept. 9.—While labor difficulties on the ore docks of the upper lakes were settled two weeks ago, the movement of ore was retarded to some extent during the past week by the strike on the coal docks. At one time 65 vessels loaded with coal were held at the docks and many of them would have been employed in the ore trade if the cargoes could have been discharged. Larger shipments of ore could be made, ore companies report, if vessels at the coal docks could be freed for such service. The effect of the ore dock strike in August is reflected in statistics relating to tonnage on dock at Lake Erie ports Sept. 1. As a result of the strike the tonnage on dock was drawn upon to a considerable extent. The amount of ore on dock Sept. 1 was 6,705,062 tons, 364,831 tons less than on dock Aug. 1, and 1,447,152 tons less than the amount on dock Sept. 1, 1918.

Shipments of ore in August amounted to 4,423,133 tons which was 5,302,198 tons less than in August, 1918. The total shipments this year up to Sept. 1 amounted to 29,604,981, or 9,729,283 tons less than in the same period in 1918. Further details relating to the shipments follow:

Port	Aug., 1919	To Sept. 1, 1919
Escanaba	336,334	2,757,897
Marquette	277,843	1,169,569
Ashland	375,245	3,320,090
Superior	939,979	6,426,447
Duluth	1,645,788	11,466,924
Two Harbors	847,944	4,464,054
Total	4,423,133	29,604,981

The market continues inactive. One firm reports the sale during the past week of a comparatively small tonnage of a special grade of ore.

Spot Coke Market is Soft

Offerings Exceed Demand and Maximum Now Appears to be $4.75—Contract Market is Quiet—Shipments Are Slow

Pittsburgh, Sept. 9.—Spot demands for blast furnace coke have fallen to extremely limtied proportions in the past few days, and while the number of loaded cars on tracks in the Connellsville region is comparatively small, offerings of free coke exceed the demand, due to the fact that operators have had much trouble in obtaining 100 per cent specifications against contracts and have this tonnage available for prompt shipment. Sales recently were fairly frequent at $5, ovens, for standard 48-hour fuel, and in a few instances as much as 5.25c was paid by coke producers, who preferred to ship their coal at $3 per ton or better rather than light up their own ovens to meet some of the preholiday demand for coke. While some business has been done in the past seven days as high as $4.90 and $5, ovens, the market now appears to have sold to $4.75 as a maximum. The opinion is expressed by consumers that since they have had several offerings of coke in the past few days, a firm bid of $4.50, ovens, would buy some of the fuel now available. The market is going through the usual reaction which follows almost all holidays. Consumers prepared for a possible shortage following Labor day and in the past week were not active buyers. Almost nothing is going on in contracts for furnace coke, possibly because few idle blast furnaces remain to be lighted, while producers also are impressed by the possibility of better prices on spot than they could expect to obtain on contract shipment. Foundry coke has not shared the weakness of 48-hour fuel as production is being kept closely within bounds of contract obligations and the unusually wide margin between prices of furnace and foundry coke is not proving much of a stimulus to the production of the latter. Labor is scarce and production of 72-hour fuel involves much labor, not only around the ovens but in loading cars. Shipments against contracts have been slow, due to the fact that the normal number of box cars have not been available, and buyers are disinclined to accept shipments in open-top cars. Such tonnages as are becoming available for stock or prompt shipment are bringing anywhere from $6 to $6.50, ovens, but in the general way $6.25 appears to be the top, except on a few small tonnages of high-grade brands. The production of coke in the Connellsville region for the week ended Aug. 30, is estimated by *The Connellsville Courier* to have been 242-395 tons, compared with 240,440 tons in the previous week.

Arranges Contract for 1920

Boston, Sept. 8.—A shortage of cars suitable for shipping coke from Connellsville to New England district is given as the reason that no beehive coke is coming into this market. The sales of by-product coke continue strong, and although there is nothing spectacular in the market a constantly increasing demand for spot deliveries indicates a healthy condition. The Rhode Island producer has announced a sliding scale contract to govern the 1920 business. Unlike the present sliding scale contracts, the new ones will have prices adjusted twice a month, based on the Connellsville price as quoted in either one of the two leading trade publications. Flat rate contracts for first half delivery are being offered by both producers at $11.90 and some business is being closed on this basis, although most consumers hesitate to pay the $1 advance above the present price of $10.90. At present there is no lack of cars for delivering coke, although shortages reported in other sections of the country are causing some anxiety over future New England conditions.

$4.75 Minimum Established

Cincinnati, Sept. 8.—Connellsville operators have about succeeded in establishing a minimum price of $4.75 for furnace coke to be shipped this year. Some coke has been sold at $4.85, and as high as $5, ovens, has been paid for some choice 48-hour brands. Foundry coke in that field is firmer, and $6 to $6.50 is being quoted. Some prompt coke has been picked up as low as $5.75, but the tonnage was limited. Future contracting is not at all active. Oven operators are holding off until they can determine what next year's production costs will be. New River foundry coke is very scarce and is quoted all the way from $9 to $10 per ton, ovens. Pocahontas foundry ranges from $8 to $8.50, and leading Wise county brands are bringing the same price. Very little fuel for shipment after Dec. 31 is being booked.

Coke Scarce, Prices Strong

St. Louis, Sept. 6.—Coke continues strong in price, and is scarce. Deliveries are unsatisfactory, especially from parts of the East, due to the car shortage and labor difficulties. A number of ovens which a short time ago were selling for first half delivery have withdrawn. Uncertainty relative to production cost after Dec. 31 has made all producers hesitate in accepting orders. Consumption in the St. Louis district is on a huge scale. All the foundries are very busy, and have orders which will keep them operating at capacity for several months.. Some sales of carloads in the West and Southwest are reported, but these transactions are chiefly in the nature of filling in. Most of the western melters have covered their requirements for the remainder of this year. In some instances, however, new business booked has necessitated the purchase of additional supplies of coke. Production by the by-product ovens here is well maintained. The coal situation is unsatisfactory, due to the strike in the Illinois coal fields adjacent to St. Louis.

Scrap Improves in West

Chicago and St. Louis Buyers Take on Tonnages—New England Situation Less Active—Other Districts Show Dullness and Easy Prices

FOR COMPLETE SCRAP PRICES SEE PAGE 733

Chicago, Sept. 9.—Definite signs of improving sentiment and a distinct feeling of better things imminent mark the iron and steel scrap situation in the Chicago market. While there is not much change from the quietness which has prevailed during the past few weeks, there has been some buying of heavy melting steel by an independent consumer. Foundries also continue to take cast scrap liberally, the demand for this grade being strong in comparison with the reduced supply now coming out. This product has yielded less in the decline of prices than any other item on the list, and relatively is scarce. Prices continue to decline gradually, and a number of grades have dropped from 50 cents to $1 during the last few days. With Labor day past, and the threat of a steel strike apparently growing less, conditions seem to be shaping themselves for a much more active period during the autumn. Somewhat better railroad offerings are being made at present, the Southern offering 2077 tons, the Santa Fe 1300 tons, the Chicago, Milwaukee & St. Paul 900 tons, the Wabash 675 tons, and the Burlington 300 tons.

Boston Demand Fallen Off

Boston, Sept. 8.—Demand in the scrap market has fallen off during the past week. However, some Pennsylvania blast furnaces are continuing to buy borings and turnings, and are taking all supplies as fast as they are offered. Some difficulty in supplying the demand is reported, yet prices, although they have stiffened, have not advanced except in a few small tonnage lots. Dealers are paying $10 for these grades, delivered. Even the foundry demand for No. 1 machinery has slackened, and a slight softening of prices in this grade is evident. Three hundred tons of cast scrap which has been held by a Boston manufacturing plant was sold during the week, one dealer taking 100 tons at $1.16 per 100 pounds. It is understood the balance was sold to a consumer at $28 per gross ton, delivered. More sales of government scrap were made through the Boston ordnance office the early part of the week. One lot of steel shell forgings went to the General Electric Co., at $22 per gross ton. Perry, Buxton & Doane Co., Boston, was awarded about 3300 tons of this same scrap at $19.06 per gross ton. Cotton ties for rebaling purposes continue to bring high prices, and $15 is a common price for this grade. Some malleable cast scrap has been changing hands, and the prices are reported to have been well up in line with the market established some weeks ago. The Lynn branch of the General Electric Co. sold a small tonnage of this grade to the Woolworth Mfg. Co. for $18.25. Other sales have been made at $17.50 delivered. The Boston navy yard is asking for bids on a large assortment of scrap. A considerable tonnage of cast and wrought pipe is among that offered.

Metropolitan Market Dull

New York, Sept. 8.—Dullness characterizes the local scrap market. Dealers state that demand for practically all descriptions is exceedingly quiet, and the market as a whole is weaker than it was a few days ago. Heavy melting steel, which usually is moving in fair quantities, now is about at a standstill. Eastern consumers are out of the market and with the railroad embargo in effect at Monessen, Pa., the movement of heavy melting steel to the Pittsburgh district is negligible. There is some buying of stove plate by a northern New Jersey consumer. This material is being taken at a figure under that offered by this buyer recently. Stove plate is quoted at $17.50 to $18 f.o.b. New York. Other quotations largely are uncharged. The government has been finding bids on shell forgings unsatisfactory. One dealer, who recently made the high bid on two lots, which aggregated about 5000 tons, has had his checks returned.

Awaiting Labor Developments

Philadelphia, Sept. 9.—Scrap conditions in the eastern market seem to be waiting on the labor situation. As was the rule in the past two weeks, buyers and sellers of steel mill grades are unwilling to act until something definite results from today's labor conference at Washington. The recent demand for low phosphorus from several important steel foundries has been satisfied and yet the market is firm and in the opinion of some producers is between $26.50 and $27, delivered eastern Pennsylvania. Such grades as borings, turnings and stove plate are scarce and in demand generally. Actual transactions in all grades, however, are few and all quotations are unchanged.

Rejections are a Factor

Pittsburgh, Sept. 9.—Current business in scrap iron and steel is confined almost entirely to the small tonnages being refused or rejected by consumers. Steel manufacturers are keeping close watch both on the quality and size of shipments against contracts. They are refusing overshipments, unless the shipper is willing to accept less than the contract price, and are rejecting those cars that contain even small pieces of material other than that stipulated in the contracts. One steel company will not knowingly take a car rejected by another and this rather limits the market on such shipments. Demurrage charges pile up rapidly in such cases and the average dealer would prefer to accept a low price than lose the difference between the contract price and what is offered in railroad charges. Small lots of heavy melting steel are moving at from $20 to $21, but they are hardly representative of the market. Dealers generally are refusing to take contracts at these prices. They fear being unable to cover them profitably and what material of this grade they have on their yards would show them a loss if sold at those figures. The labor situation is the dominating factor in the market at present and until there is a definite clearing up of the uncertainty, demand is expected to lag. Dealers believe the situation will clarify shortly and are not pressing material for sale now.

Buffalo Market Firm

Buffalo, Sept. 9.—The scrap market continues firm, but there is not a great deal of buying either by local or outside consumers. Local users have probably been dipping deeper into stocks of the dealers during the week than have outsiders. Outside mills are now having scrap delivered against old orders. Heavy melting steel was sold during the week at $19 and $20. Demand for special grades used by steel casting plants doing railroad work has fallen off. Dealers say the market is healthy.

Valley Buying is Light

Youngstown, O., Sept. 9.—Not much demand exists for heavy melting scrap in this district. Dealers' have a good supply on hand which they bought around $12 to $14 and unless attractive prices are offered they refuse to stock any further tonnages. In this district this material is bringing $21 to $21.50 per ton. Light bundled scrap is moving in better lots and a good inquiry for this grade is out.

Weakness Less Pronounced

Cleveland, Sept. 9.—Scrap iron and steel in this district seems a little firmer. The weakness that has governed the last few weeks is less pronounced. Dealers, insisting the bottom has been reached for the present, are declaring that they will not sell under the present market quotations. The mills, on the other hand, appear somewhat at a loss to determine whether to buy now or take a chance on still lower prices. The net result is a minimum of trading, barring a few deals among brokers. A large amount of scrap is moving on contract. Heavy melting steel is quoted at $19.75 to $20 machine shop turnings at $11 to $11.25, No. 1 cast at $23 to $23.50 and No. 1 railroad wrought at $24 to $24.50.

Foundries Buying Freely

Cincinnati, Sept. 8.—Melters of foundry iron scrap are buying quite freely, although they have limited stocks to draw on. Foundry cupola-size scrap is firmer, and No. 1 cast has been advanced 50 cents a ton. There is no call for malleable scrap and very little buying of steel scrap. All kinds of wrought scrap also show some weakness, although no definite change in quotations has been made. The car supply has improved some and outside shipments on contracts are moving with a fair degree of promptness. The short supply of high

silicon iron has curtailed the use of foundry scrap to some extent, but this has had no appreciable effect on stove foundries which are melting large quantities.

St. Louis Market Looking Up

St. Louis, Sept. 6.—A much better undertone developed in the scrap market. The improved labor outlook has served to remove some of the recent pessimism, and consumers are becoming more interested. General consumption is on a large scale, especially with the foundries, while rolling mills are buying small tonnages for immediate use. The leading foundry interest purchased a fair tonnage of cast scrap, and the American Steel Foundries bought about 2000 tons. Offerings are not large, and come mainly from dealers, who are bullish in their views. Yard stocks are heavy, and holders seem confident that much higher prices will be obtainable later in the season. Virtually nothing is coming in from the country. Railroads are easing out tonnages from time to time in private sale, but are not pressing their material for sale. The following lists were before the market during the week: St. Louis Terminal Railway association, 250 tons, Missouri, Kansas & Texas, 1100 tons, and the Frisco railroad, 800. Several good lists are expected this week from western lines. Cash grades are in particularly good demand at the moment. A moderate inquiry is noted for malleable scrap, and material suitable for stovemakers is in demand. Steel mill grades are slow.

Alabama Prices Marked Up

Birmingham, Ala., Sept. 9.—There is some activity in the scrap market, and quotations are gaining strength. Advances have been made on most grades, and heavy melting steel is held at a higher figure than the larger consumers here are willing to pay. Cast scrap is still sought by Chattanooga foundrymen, and there is demand for low grade material, sash weights, turnings and borings.

Stock Sheets In Demand

New York, Sept. 8.—Outstanding in the local warehouse market is a heavy demand for sheets. The mills, it appears, are booked well ahead on domestic orders and in addition are confronted with a good demand for export. With this the situation, the warehouses are in receipt of a heavier inquiry for sheets than at any time this year, and prices have been advanced. The market on black sheets may now be quoted at 5.75c, an advance of $5 per ton, and galvanized sheets at 7c, the former inside figure of 6.75c having disappeared. In addition to sheets, there also continues to be considerable activity in steel bars for reinforcing purposes. Prices, however, remain unchanged at 3.37c, New York. As a matter of fact, a better demand is in evidence for virtually all lines, with the possible exception of plates and shapes, which continue to lag. August, for most warehouses, was the most active so far this year, and September, it is believed, will eclipse this record.

Plate Orders Growing

Chicago Mills Well Booked to End of Year—Eastern Mill Makes Sales at 265c Pittsburgh—Japan Buys Tonnage

Philadelphia, Sept. 9.—Several Philadelphia district steel plate makers have booked additional tonnages for both domestic and export use and each one declares he secured 2.65c Pittsburgh without trouble. Several thousand tons of ship plates for delivery over seas are included. Eastern boiler makers, especially those catering to oil country equipment trade are placing fair tonnages for both tanks and boilers. No immediate prospects for new shipbuilding work appear in Philadelphia district but some are said to be held in abeyance further north along the coast.

Japan Buys at 2.65c

New York, Sept. 9.—Some comfortable tonnages of steel plates have been figured on in this district and some of this business has been for export. Something like 1200 to 1500 tons of plates for shipment to Japan have been placed with an eastern mill at the 2.65c price, this within a few days. Still another inquiry for 3000 tons is open, but it may be some time before this is placed.

Refinery Work is Placed

Cleveland, Sept. 9.—Several thousand tons of plate work for tanks and stills for the new refinery of the Standard Oil Co. to be erected at Toledo are reported to have been placed with a northern Ohio fabricator. Nothing has developed in the matter of the 6000 to 7000 tons of ship steel inquiry from lake yards which was noted a week ago.

Demand Continues Strong

Chicago, Sept. 9.—Although demand for steel plates has not become as active as that for soft steel bars, it is stronger than had been expected and plate mills are well filled for the remainder of this year. Plates are being bought by carbuilders for repair work, a recent sale involving about 400 tons, while builders of tank cars are unusually active and taking considerable of this material.

Bookings Are Small

Pittsburgh, Sept. 9.—While a fair amount of plate business daily is developing, it is proving no tax upon mill capacity and bookings are small in comparison with those for other lines of finished steel. Outside of the navy requirements and a moderate amount of business in connection with some ships under construction for the United States Steel Corp., demand from shipbuilders has been extremely light. A little business is reaching manufacturers in connection with car repair work, but the principal demand still is from the makers of tanks. Locomotive builders are a little busier than they have been, due to some fair export orders. The Baldwin Locomotive Works received 150 locomotives for shipment to Poland and the American Locomotive Co., 65 locomotives for Egypt. Prices still incline toward softness, chiefly as a result of the Carnegie Steel Co. bid of 2.50c, Pittsburgh, on the plate requirements for battleships Nos. 49 and 50. At the moment the market is nearer that base than 2.65c.

Mills Flooded

By Flow of Sheet Inquiries—Operations at 90 Per Cent

Pittsburgh, Sept. 9.—Sheet manufacturers still are being flooded with inquiries with which they can do little owing to the fact that present bookings are sufficient to keep mill capacity engaged at its present rate of operation to the end of the year. Some manufacturers are not as fully booked on blue annealed sheets as they are on other kinds and probably could slip in a little additional tonnage on this line. But on black, galvanized and specialties manufacturers have reached a condition in live business, where they cannot accept new orders even from regular customers which call for delivery this year. The American Sheet & Tin Plate Co. is scheduling about 93 per cent of its mills this week, but indepedent capacity is less fully engaged, due to the fact that the Stark Rolling Mills, Canton, O., and the Newport Rolling Mills, Newport, Ky., still are down. Making allowance for the loss of the 49 mills of these companies, present sheet mill operations may be placed at about 90 per cent of capacity.

Demand Exceeds Supply

Chicago, Sept. 9.—Sheet manufacturers find demand for their product is greater than their ability to book business for delivery over the remainder of this year and much inquiry is being turned down.

Early Tonnage Not Wanted

Youngstown, O., Sept. 9.—Contract business is commanding the attention of sheetmakers here. A few makers continue to remain out of the market and it is not thought any additional business can be placed with these makers until Jan. 1. Some producers have notified their district sales offices to discontinue the solicitation of further sheet business while others have notified their salesmen not to take on any more business for the time being. Practically no overage is being rolled. A good inquiry exists for all grades of sheets but makers are not quoting. Buyers who formerly patronized makers in nearby districts are making every effort to place their business with mills in this territory, but so far they have not been successful. Their tonnages formerly were placed with certain mills which are now idle on account of labor conditions. An export inquiry for 1000 tons of galvanized was quoted on this week by a dealer here.

Bar Mills Are About Full

Agricultural Implement Makers Specifiy Heavily—Shipments Falling Back—Prices Incline Upward

Chicago, Sept. 9.—Mills rolling soft steel bars find their books well filled for the remainder of the present year and more business continues to be offered each week. All consumers with tonnage on mill books are specifying freely, indicating great activity in their manufacturing processes. Agricultural implement manufacturers are taking out their full tonnage and other manufacturers are not behind. Inquiry is being received for 1920 contracts, and a few sales have been made running in to next year to cover business demanded by consumers for delivery during that year. Prices for 1920 have not been changed from those prevailing at present. While this buying is not in large quantity, mills generally would not avoid entering further business for next year. The leading interest is operating now practically at capacity, and with all its blast furnaces and open hearths active, shipments on contracts for soft steel bars are falling somewhat behind.

Demand for bar iron is unusually slack, and two mills in this district are down for this week, one not expecting to operate until October. Another bar iron mill is operating on steel bars, rerolling billets for another interest. In spite of the slack situation, one producer has advanced the price to 2.75c, Chicago mill, while others are holding at 2.62c, Chicago mill.

A good tonnage of hard steel bars is being offered and manufacturers with contracts on mill books are specifying strongly.

Not Urging Specifications

New York, Sept. 9.—Steel bar sales in general are said to have placed the mills in eastern territory in such satisfactory position that sellers are not pushing consumers for specifications except in respect to certain sizes which might balance mill schedules. A fair volume of the usual business is coming forward every day and deliveries are slipping behind gradually but not markedly in some instances. Export bar tonnage inquiry has been quiet the past week.

Prices Tending Higher

Pittsburgh, Sept. 9.—Prices of both steel and iron bars show an upward tendency in this market. The Cambria Steel Co. is holding firmly to its recent advance of 2.50c Pittsburgh base to the outside trade and several independent companies are getting as high as 2.50c Pittsburgh on export business and on bars rolled on hand mills where costs rule high they also are demanding a premium over the March 21 base from domestic consumers. All makers of bars are so well sold up with business as to be unable to give much attention to new demands and it has been necessary in some cases recently for consumers to seek supplies urgently needed for warehouses. The Carnegie Steel Co., who made no change in its quotation, still is holding the base of 2.35c Pittsburgh. Concrete reinforcing bars are in strong demand for immediate shipment with most makers so heavily committed as to be unable to consider much new business. Hard bars rolled from new steel are quoted at 2.35c base Pittsburgh with the usual extras for twisting and deforming, while the most recent business in rerolled bars was at 2.50c mill. The Aluminum Co. of America is planning a plant at Edgewater, N. J., of concrete construction and has asked for 1500 tons of reinforcing bars. While one maker of common iron bars has some tonnage available at 2.55c Pittsburgh, most producers are naming 2.75c Pittsburgh as a minimum on carloads and are asking 3.00c in less than carloads. Demand for iron bars is good but far from active.

All Bolt Users Active

Chicago, Sept. 9.—Conditions could not be better in the market for bolts and nuts with all western mills operating practically at capacity and all classes of consumers taking out material on their contracts and seeking further tonnage. Automobile and agricultural implement manufacturers are especially in need of this material, and jobbers are seeking further supplies.

Room for More Orders

Pittsburgh, Sept. 9.—While makers of nuts, bolts and rivets generally are comfortably well off in the matter of bookings for shipment over the remainder of the year, several of them are in a position to take on additional orders. Books, however, have not been opened for first quarter and half of 1920 as yet as manufacturers do not want to be committed far ahead in the event of higher bar or rod prices. Prices are unchanged save on nuts, some makers of which now are quoting 2.70c off list for blank and 2.45c off list for tapped. Deliveries against orders are fairly prompt though hampered in some instances by poorer car supplies.

Makers Are Running Full

Cleveland, Sept. 9.—Makers of nuts, bolts and rivets have all the business they can handle at present and are running full. This is contributed by various consuming industries and from time to time, foreign orders are taken. Inquiries are frequent and prices remain firm at the recent advance. Books are not yet open for first quarter and half of 1920. One large maker is running his steel plant, rolling mill and some departments of the nut and bolt shops 24 hours daily.

Demand Still Expanding

Pittsburgh, Sept. 9.—Makers of cold finished steel bars and shafting still report a steady expansion in the demand and most of them now have a fair backlog of advance bookings. Buyers are specifying fairly freely and slightly heavier mill operations are necessary to enable the manufacturers to keep up with their orders. Prices are firm in keeping with the market for ordinary steel bars.

Mills Fairly Busy

Pittsburgh, Sept. 9.—Hoop and band mills are fairly engaged, for while cooperage interests are moderate buyers and cotton tie requirements for this season largely are made up, some heavy demands are coming out from both domestic and foreign sources for bands. The cotton crop now promises to be only a little more than 11,000,000 bales and early rollings of ties were based on a probable crop of more than 12,000,000 bales. Specifications against contracts are fairly good, with this month's shipments taking a price of $1.74½ per bundle of 45 pounds in lots of 3000 bundles or more. Band steel is reported to have sold at 3.50c, base, Pittsburgh, but on domestic business 3.05c still is the general price on both bands and hoops.

Big Orders

For Mill Pipe Receive Scant Attention—South America Buys Cast

Pittsburgh, Sept. 9.—The problem of the manufacturers of lapweld pipe at present is in what business to accept and what to turn down. Makers of both steel and wrought iron pipe are sold much further ahead on lapweld pipe than is considered desirable and they are not giving much attention to the numerous new inquiries that are coming out, except occasionally sliding in small tonnages urgently required by regular customers. No large line pipe inquiries recently have come out, but those involving small tonnages have been frequent and it is probably no exaggeration to say that in the aggregate these amount to several thousand miles. With the expansion in building activity and the attendant demand for water, gas and conduit pipe, much more buttweld pipe capacity is in operation today than in a long time. Building operations in August, according to reliable sources, exceeded those of August, 1918, by 33 per cent and also showed a substantial gain over July of this year. Demands for both mechanical and boiler tubes are gaining steadily and while some price cutting is going on, it is considerably less frequent or important than it was a short time ago. Automobile manufacturers are ordering much mechanical tubing and a number of good sized inquiries for boiler tubes recently have been made by the locomotive builders who have been getting some good export orders.

South America Buys Lot

New York, Sept. 8.—Featuring trading in the eastern cast iron pipe market during the past few days, is a lot of 1000 tons for South America. This business, placed with one seller, went at a figure approximating the domestic market, and follows the award of several smaller tonnages noted recently for export to South America. Aside from these orders, however, little business is being

placed for foreign shipment, despite the various miscellaneous export inquiries afloat. Although municipal inquiry is practically at a standstill, domestic demand is noted in fairly good volume, various small tonnages for private consumption being placed. Sellers are at more or less of a loss in accounting for the almost total lack of public buying with the cities reported to be in such urgent need of improved facilities. Prices appear stronger. Shop capacity in virtually every instance in the east is being limited by the scarcity of labor. Some shops have succeeded in getting their operations up to 70 and 75 per cent, but these are the exception. The majority are running at 60 per cent.

Shops Lack Large Sizes

Chicago, Sept. 9.—With the season for pipe laying drawing to a close, mills find numerous inquiries for cast iron pipe, mostly in small tonnages and almost entirely for small sizes. The latter condition is something of an embarrassment, as shops need large sizes to keep their operation balanced. Bids have been taken at Salt Lake City on 1600 tons of 30-inch pipe on which no award has yet been made. The United States Cast Iron Pipe & Foundry Co. has received an order for 1700 tons at Elmhurst, Ill., a contractor's job. Bids will be opened Sept. 12 at McCook, Nebr., on 76 tons, and on Sept. 19 at Wooster, O., on 543 tons.

Tin Plate Demand

Far in Excess of Supply—Prices Growing Firmer

Pittsburgh, Sept. 9.—Makers of tin plate are finding it a good deal of a problem to consider, let alone supply, all the demands that are coming to them. With present bookings sufficient to carry them through to about Nov. 15, by which time orders for early 1920 delivery will be flowing in, manufacturers are practically out of the market for the remainder of the year. Much business for early shipment, which is seeking makers is being turned down. Among recent inquiries of this sort was one for 200,000 boxes from a domestic consumer, who like so many others made a poor guess as to this season's requirements. Export inquiries still are numerous and large, but go begging in a good many instances because of the filled-up condition of makers' order books. The leading interest is paying more attention at the moment to domestic than to foreign business. Manufacturers generally are so well supplied with live business that they can afford to take a firmer stand on prices, and they are doing so. While some export business is being taken as low as $6.75 per base box, Pittsburgh, that is a net cash price and, allowing for the usual discounts granted for cash, is equivalent to almost $6.90. Furthermore, small export tonnages are being placed as high as $7.25. On domestic business the price of $7 is not being shaded and stock items are averaging a little higher, due to the fact that the mills have pretty well reduced stocks, while the demand is active and big.

British Withdraw Prices

Anti-Dumping Action by American Producers of Ferromanganese Has Effect—$95 and $100 Quotations Disappear

Philadelphia, Sept. 9.—British sellers of ferromanganese who recently have been offering this metal at $95 and $100 seaboard and had made some sales at these figures, have withdrawn these prices indefinitely. This course has been taken as the result of the complaint of domestic producers to the federal trade commission that these interests were violating the antidumping law by making prices on this lower than those at which they were selling at home. In some cases, where offers of $95 had been accepted by the agents of the British makers, the transactions have been called off by the seller. This applied in one lot of 1500 tons.

Ferro Market is Quiet

New York, Sept. 9.—Since the larger interests identified with importations of ferromanganese in this territory are declared either to have taken all the business they desire at this time, or have not committed themselves heavily for the future, the market generally is quiet. It is understood that an inquiry from the Chicago district steelmaker for 1500 tons has been satisfied at least as to 1000 tons said to have been imported material.

Low Prices on English Ferromanganese

Pittsburgh, Sept. 9.—English makers of ferromanganese are making a strong effort to regain their former place in American trade and have materially underquoted domestic producers in their drive to secure business. An offer of 200 tons of English 78 to 82 per cent material was made to an Ohio valley steel manufacturer at about $103, delivered, but was not purchased. This is equivalent to about $98 at Atlantic seaboard and even less if the material was shipped from Baltimore or some of the northern ports as the freight rate to this plant from all except Norfolk is above $5 a ton. Other sales of English material are understood to have been made at around $95 seaboard and large producers meanwhile are holding rather firmly at within a few dollars a ton of their recent asking prices. A sale of 700 tons of domestic 78 to 82 per cent ferromanganese is noted to a valley steel manufacturer at $107, delivered, and against another inquiry for 400 tons, $108, delivered, has been quoted.

Aside from the fact that some makers of 50 per cent ferrosilicon who recently have been quoting that material at $80, delivered Pittsburgh, now are naming $85, no particular change has taken place in the market for this alloy.

Ferrotungsten demands are not being much stimulated by the possibility of higher prices that will result in the event of an enactment of the bill now before the United States senate imposing rather heavy duties on both tungsten ore and metal. While ferrotungsten is quoted as high as $1.30 a pound, at least one good sized tonnage is available here for 10c a pound less and a firm bid of $1.15 probably would get consideration.

Inquiries Are Held Up

Cleveland, Sept. 9.—About 4500 tons of inquiries for ferromanganese which have been current in Cleveland and valley territory, have been rendered inactive because of the withdrawal by English makers of the $95 to $100 seaboard prices which they have recently quoted. The action of the latter is due to the situation which has been produced by the complaint filed by domestic makers at Washington against the agents of English producers under the antidumping law. Of the inquiries which have been pending in this territory, 2000 tons for a Youngstown consumer has been withdrawn; 1500 tons for another is suspended and the same applies to scattered lots totalling to about 1000 tons. Before the action was taken by domestic producers, 250 tons of British metal were sold to a local buyer on the basis of about $95 seaboard.

Ferrosilicon Quoted Higher

New York, Sept. 8.—The market for 50 per cent ferrosilicon is somewhat higher. Sales recently have been made on the basis of $82 to $83, delivered, as compared with $80 previously. No more resale alloy is offering, so far as known. Most of the large makers of 50 per cent ferrosilicon are quoting upwards of $100 a ton delivered and it is believed round tonnages of the alloy could not be obtained much under this figure. The market may be quoted $85 to $90, freight allowed. Some 75 per cent ferrosilicon was sold at $155, delivered Pittsburgh district.

Some makers of special steels have bought rather heavily of ferrotungsten in anticipation of the enactment of a bill to protect the domestic tungsten trade. A bill to levy $10 a short ton unit on imports of tungsten concentrates recently passed the house. This bill carries an amendment by which holders of foreign ore already in this country would be assessed for the difference between their cost price and $17 a unit. The protest among such holders is very strong; they claim such a levy would be unconstitutional and virtually confiscatory and furthermore they wonder how such stocks are going to be located. Some ferrotungsten which had been imported from England sold through dealers at $1.15 a pound of metallic tungsten contained.

The ferrovanadium market is stronger, business in high grade alloy having been done at $7.50 a pound contained for comparatively large quantities. Small quantities have sold up to $10 a pound.

The ferrochrome market is irregular. The leading maker is quoting 28c on 4 to 6 per cent carbon, but this price is being shaded, particularly on imported alloy.

Ferromolybdenum is offered at $2 a pound contained, delivered.

Shape Outlook Better

600,000 Tons Estimated to be in Deferred Bid Class—20,000 Ton Cleveland Job Reported Closed—Inquiry Good

Pittsburgh, Sept. 9.—August structural lettings are said to have reached the same tonnage as those of the previous month notwithstanding the fact that the last week of the month was marked by considerable hesitancy on the part of buyers in the fear of labor troubles on Labor day. The possibility of a tie-up of the steel plants now seems slight and the trade is inclined to take a cheerful view of the situation, especially in view of the fact that in the past six months no less than 600,000 tons of structural steel has been inquired for, figured upon, and then shelved. Buyers, apparently, are beginning to realize that they will not be able to do better in the matter of prices later on and lately a number of inquiries which have lain dormant for several weeks have made their re-appearance. The American Bridge Co. has taken 2750 tons for the new plant of the Aluminum Co. of America at Marysville, Tenn. The Baltimore & Ohio railroad has placed 750 tons for a plate girder bridge at Highland, Pa. The Bethlehem Steel Co. is almost certain to be awarded 7000 tons for a hangar for dirigibles at Lakehurst, N. J.

Many Jobs Are Planned

Boston, Sept. 9.—Although the tonnage of structural steel let during the last week in this district shows a slight increase over the previous week, all contracts have been small. Considerable talk of large construction has been circulating, the most prominent item being the New Bankers building which it is understood will go ahead in the near future. This building as now planned will require about 4500 tons. Industrial plants throughout eastern New England report exceptionally favorable conditions and much new construction is planned. The New England Oil Refining Co. has plans for two large plants, one at Providence to cost $1,000,000 and a smaller to be located at Fall River, Mass. The contract for an $800,000 addition to the Pawtucket, R. I., plant of J. & P. Coats, Inc., has been let.

Low Prices Disappearing

New York, Sept. 8.—Although few large tonnages have been noted of late, structural bookings, according to local fabricators, continue to increase, and the low prices quoted recently are disappearing. On the general run of fabricated material, the market now appears to be around $75 to $85 a ton. Despite the increased amount of buying, a fairly good volume of business is pending. Some of this tonnage, it is said, has been held up for some time, and some interests attribute this to a hesitancy among builders to proceed until further assurances are forthcoming that the labor crisis has been passed. Others, however, attach but little importance to the labor situation as it now stands. Included in the larger awards at present is a lot of 1800 tons for a Boston & Maine railroad bridge at Haverhill, Mass., and 2000 tons for an exposition building in the south. Another sizable award involved 1800 tons for the Corn Products Refining Co., at Edgewater, N. J. A $534,180 contract for the superstructure of a 2100-foot bridge across the St. Johns river at Jacksonville, Fla., has been awarded the Bethlehem Steel Bridge Corp. A $374,447 contract for the foundations and approaches went to the Missouri Bridge & Iron Co., Leavenworth, Kans.

Small Contracts Are Placed

Philadelphia, Sept. 9.—New structural business in this district is slow and contracts placed this week are small, as for example, about 150 tons on which the city took bids yesterday for small extension to the Frankford elevated railways. Shape mills are mildly interested in a hearing held today by the eastern traffic committee in Broad street station on a two-year-old complaint by fabricators on fabrication-in-transit charges. The general opinion now seems to be that since the government controls railroads and is little interested in building up traffic, it likely will not change the present rules.

Western Demand Continues

Chicago, Sept. 9.—Although building operations in Chicago and vicinity are still held up by a strike and lockout, demand for structural material from other points in the west is sufficient to keep up the total which has been fairly high through several weeks. During the past few days no unusually large tonnages have been placed, the largest being 412 tons for a tank shop for the Wayne Oil Tank & Pump Co. Other projects are for smaller tonnages. The waiting list, containing a number of tonnages, seems slow to close and considerable delay is met in changing inquiries into contracts. Hubbard & Co., Chicago, is inquiring for 378 tons for an office building and plant on which bids have been taken.

Large Jobs Awarded at Cleveland

Cleveland, Sept. 9.—The contract for 20,000 tons of structural shapes for the new office building to be erected jointly by the Citizens Savings & Trust Co., and the Union National bank is reported to have been awarded to the American Bridge Co. The county building commission has awarded the contract for 1700 tons for the county jail building to the Van Dorn Iron Works, this company's bid of $109.40 erected having been the lowest received. Some private work in this city is understood to have gone recently under $75 delivered. The difference in prices quoted on the public and private jobs is understood to be due largely to the fact that equipment is tied up in the average public job much longer than in the private job, and other circumstances of a similar character. The McClintic-Marshall Co. took 700 tons for the machine shop for the Firestone Tire & Rubber Co., Akron, O., the latest of the several new buildings being erected by this company. The American Bridge Co. received 1200 tons for the Toledo Machine & Tool Co., Toledo, O. The National Iron & Wire Co. was awarded 160 tons for a building for the Glidden Varnish Co., Cleveland. Contrary to expectations, the Cleveland library commission has decided to build the new library of concrete, although a fair tonnage of structural shapes will be required for the lower part of the building as designed. New jobs are developing at a fair rate, and include a 14-story building to cost $1,000,000 and to be erected next spring on the site of the present Opera House.

CONTRACTS AWARDED

Addition to Germania Mills, Holyoke, Mass., 500 tons, to the American Bridge Co.

wridge for Boston & Maine railroad, Haverhill, Mass., 1800 tons, awarded to independent shop.

Exposition building in south, 2000 tons, to the Richmond Structural Steel Co.

Noyes-Buick service station, Boston, 300 tons, to the New England Structural Co.

Building at plant of Corn Products Refining Co., Edgewater, N. J., 1800 tons, to McClintic-Marshall.

Office building for Citilens Savings & Trust Co., and Union National bank, 20,000 tons, reported to American Bridge Co.

Cuyahoga county, O., jail building, 1700 tons, to Van Dorn Iron Works.

Building for Toledo Machine & Tool Co., 1200 tons, to American Bridge Co.

Machine shop for Firestone Tire & Rubber Co., Akron, O., 700 tons, to McClintic-Marshall Co.

Chemical plant for Virginia-Carolina Chemical Co., Charleston, S. C., 200 tons, to Fort Pitt Bridge Co.

Building for Glidden Varnish Co., Cleveland, 160 tons, to National Iron & Wire Co.

Tank shop for the Wayne Oil Tank & Pump Co., Ft. Wayne, Ind., 412 tons, to the Alliance Structural Steel Co.

Baseule bridge over Manitowoc river, Manitowoc, Wis., 322 tons, to the Milwaukee Bridge Co.

Addition to plant for the St. Louis Basket & Box Co., St. Louis, 239 tons, to the Structural Steel Co., St. Louis, formerly the Kaysing Iron & Foundry Co.

Theater, store and office building, for Auerbach & Co., Chicago, 203 tons, to the Kryl Bridge & Crane Co.

Foundry building for the Great Falls Iron Works, Great Ralls, Mont., 124 tons, to the Minneapolis Steel & Machinery Co.

Supports for lubricating oil stills for the Marland Refining Co., Poca City, Okla., 107 tons.

New plant for the Aluminum Co. of America, Marysville, Tenn., 2750 tons to the American Bridge Co.

New pattern shop and warehouse for the Pittsburgh Valve, Foundry & Construction Co., 500 tons to the Jones & Laughlin Steel Co.

Bridge No. 66 for the Baltimore & Ohio railroad at Highland, Pa., 750 tons to the McClintic-Marshall Co.

CONTRACTS PENDING

Addition to School No. 144, Brooklyn, 340 tons, contract pending.

Building for Columbia Chemical Co., Barkerton, O., Van Blarcom Cleveland, general contracts; 260 tons, bids being taken.

Hubbard & Co., Chicago, office building and plant; 378 tons. Bids in.

Addition to Saco Lowells shops, Upper Newton Falls, Mass., 120 tons; bids being taken.

Building for Bryant Electric Co., Bridgeport, Conn., 300 tons; bids to be taken soon.

Addition to Germanian Mills, Holyoke, Mass., 400 tons; bids to be taken soon.

Billet Order

For 20,000 Tons For Export Held Up—Sheet Bars Easier

Chicago, Sept. 9.—Activity of sheet and wire mills is giving an unusual demand for steel for these purposes, and producers of billets and bars are being called on to supply a heavy tonnage. This is having a strong effect in keeping open-hearth furnaces at top production. A recent inquiry for 20,000 tons of billets for export, which came almost to the point of being closed, has fallen through on account of the foreign exchange situation. This material will not be sold unless different arrangements are made for financing.

New Demands are Light

Pittsburgh, Sept. 9.—New inquiries for sheet bars and billets in this market lately have been as few as they were numerous about a fortnight ago. The Carnegie Steel Co. in August averaged better than 99 per cent of ingot capacity and is averaging close to that point at present. With independent producers doing practically as well, contract obligations are being more promptly met and finishing mills have not been obliged to seek additional tonnages on the open market. Recent talk of premiums on sheet bars has entirely ceased. Consumers of billets are getting ample tonnages and there are enough wire rods to meet all current demands. Several of the producers of wire rods have some surplus tonnage over their own requirements and are offering them for prompt shipment. A sale of 500 tons of soft rods is noted to a domestic consumer at $52, Pittsburgh. Export inquiries for rods have been somewhat fewer in the past week than they were recently.

Much Tonnage Seeks Sellers

Cleveland, Sept. 9.—Sheet bar sellers in this district say they could book many thousands of tons quickly if they had the steel. Valley buyers have offered to pay the Youngstown base price of $42 at Cleveland which with freight to destination would amount to $1 advance. Some consumers have sought contracts for next year. The heavy run of specifications for sheet bars is reflected in the fact that the local maker is operating all his open hearths.

More Tonnage

Vainly Sought by Wire Consumers—Specifications Exceed Output

Pittsburgh, Sept. 9.—Consumers of wire and wire products still are pressing manufacturers for supplies and if the latter were so disposed they might take on tonnages that would insure the present rate of mill operations well into next year. As matters stand, however, with regard to prices, none of the manufacturers are inclined to take on any more business for the present as practically all production is needed in meeting current live business and mills surplus that develops readily is disposed of to regular customers. The mills in this district are running between 75 and 80 per cent of capacity, labor shortage keeping down the output, while specifications and new orders are at least 10 per cent higher. One independent company in August made shipments equal to 80 per cent of normal capacity but in doing so was obliged to draw heavily upon its warehouse stocks.

Buyers Urge Shipment

Chicago, Sept. 9.—Not only are consumers of wire seeking further tonnage, but frequent requests are being received for prompt shipment, and results of the recent car shortage are apparent. However, somewhat better car service has been given recently, and shipments are going forward in larger tonnage.

Unfilled Tonnage Gains

For the third consecutive month, unfilled tonnage of the United States Steel Corp. showed an increase in August, this amounting to 530,442 tons. The gain brought the total unfilled tonnage as of Aug. 31 to 6,109,103 tons, which is the largest since January, when the unshipped orders amounted to 6,684,268 tons.

Steady Increase

Shown in Ingot Output—August Gain is 9.5 Per Cent

For the third consecutive month, steel ingot production continued on the increase during August, although the increase was not as marked as that of July. According to the statistics of the American Iron and Steel institute, which reports the figures of 30 steel companies making 84.03 per cent of the country's steel output in 1918, a total of 2,746,081 tons were produced in August. This compared to the July output of 2,508,176 tons is a gain of 237,905 tons or 9.5 per cent. The gain of July over June was 13 per cent.

Following are the institute's figures from January, 1918, to August, 1919:

Months	Open hearth, gross tons	Bessemer, gross tons	All other, gross tons	Total, gross tons
Jan., 1918	1,763,356	429,588	10,901	2,203,845

* August shipment from Singapore, c.i.f. New York.
† American Smelting & Refining Co.'s price.
‡ Producers' price. Outside market unchanged 22.25c to 22.50c, casting 21.75c to 22c, lake 22.50c to 24c.

NEW YORK, Sept. 9.—In response to the improvement in general sentiment on the labor situation, the metal markets improved perceptibly the past week. This was particularly true of consumers in the iron and steel industry, whose inquiries for tin and zinc were one of the features of the week. The markets continued to reflect the activities of second hand sellers, especially in copper.

Between 5000 and 10,000 tons of electrolytic copper were sold in the outside copper market last week, the metal going for the most part into the hands of strong consumers. The prices paid were 22.25c for September, 22.50c for October, as compared with the producers quotations of 23.50c for September and 24c for October.

The zinc market experienced a good demand a large number of galvanizers being in the market for September and October shipment prime western. However, prices did not reflect this inquiry to any extent, the market ranging from 7.40c to 7.45c, East St. Louis basis, all week, considerable business being done at the lower figure. Today the market turned weak, 7.37½c to 7.40c on prompt September.

The lead market also experienced an improved inquiry the past few days, several thousand tons being sold. The outside market again was slightly below the producers' price, some outsiders quoting prompt shipment down to 5.90c and spot in the East at 5.85c. By Sept. 8, however, this disparity largely disappeared, some business being done for prompt shipment on the basis of 6.05c, New York.

Solder and babbit makers have bought heavily of 99 per cent tin, such as English Lamb & Flagg and domestic grades and the supply of spot 99 per cent is scant. Prices advanced to 55c, New York. Tin plate makers also have been heavy buyers for shipment in September and October.

Antimony is quiet and unchanged at 8.50c.

The aluminum market is quiet and devoid of developments.

Nickel prices are as follows: Shot, 43c; electrolytic, 45c; and ingot, 41c.

September Exports On Increase

Railway Equipment Builders Propose to Form Export Banking Company—China and the Orient Generally Enlarge Their Purchases — Mills Filling Up With Orders, Discourage Foreign Buyers—Many Sales Reported

NEW YORK, Sept. 8.—September business in iron and steel is opening up with a bound. Export agents are more concerned with the problem of finding the materials in the American markets than to make sales abroad. One of the largest and oldest established houses declared that if this rate of increase continues the United States could sell at least 15,000,000 tons of iron and steel in 1920. That is a figure, however, which he estimated the American steel industry would be unable to produce for foreign customers. By next year the domestic needs should be normal, it is pointed out, and the surplus left for exporting will not be adequate to care for all the inquiries from abroad.

The rapid filling up of the mills with orders has made the export situation more acute. The United States Steel Corp. has notified the exporting houses that it cannot fill any orders for tin plate, galvanized sheets, barbed wire, and wire nails until next January. The Consolidated Steel Corp. sold out on sheets some time ago, and the Gulf State Steel Co. cannot furnish either wire or nails until next December. The Jones & Laughlin Steel Co. are sold up for several months. Foreign business is picking up rapidly but the mills are inclined to discourage inquiries and it is becoming highly difficult to obtain deliveries.

This healthy increase in business comes from the Orient and South America almost exclusively. The European situation is very poor and only a few of the companies with especially strong financial backing are attempting to develop any kind of a market there. It is learned from some houses that unusual sales have been made to Spain and it is believed that these orders have been for resale in France and Italy. The pesata is still selling at a premium and this is a natural encouragement to the Spanish to make purchases in the American market. The exchange is reputed to be operating in such a manner as to make it profitable for the Spanish merchants to resell American iron and steel in Europe to nations where the exchange now prevents us making sales direct. This is a situation which is also said to be duplicated in a modified way in the Scandinavian countries.

One small house reported the sale of 7000 boxes of tin plate and 1000 tons of galvanized sheets to Spain. Spain is also said to have been buying much railroad material. The trade has been talking about an inquiry from Russia for a considerable quantity of rails and railway equipment.

Competing with England

A sale of 1000 tons of ship plates to France was reported. England has removed her import restrictions but there appears to be no great rush of business as a consequence. The weak exchange is preventing sales and the artificial import restrictions no longer are necessary. In other countries of Europe it is difficult to obtain import permits and many of the export houses consequently are prevented doing any business. The Steel corporation appears to be the only agency which is equipped to cope with such a situation. The corporation has been doing a constant business in England.

Among the recent inquiries from Italy were 1000 tons of pig iron, 1000 tons of structurals and 1000 tons of plates. Portugal has been inquiring for hoops in small quantities. Australia has purchased some fabricated copper and 200 tons of galvanized wire, while she has inquiries out for 500 tons of bars and 3000 kegs of nails. The Philippines have purchased over 900 tons of light rails and some tin plate.

One of the larger houses reports the sale of 10,000 tons of ship plates to Japan. Another has sold Japan 24,000 boxes of tin plate. That country also recently has purchased 5000 boxes of tin plate and 2000 bundles of galvanized wire from another seller. An inquiry has been received for 150 tons of light sheets and 200 tons of bars. One house reports the sale of 200 tons of plates to Japan. One of the smaller export houses which normally does not attempt business in the Orient has received an inquiry from Japan for 3000 tons of galvanized sheets and 2000 tons of steel bars.

China has purchased 3000 boxes of tin plate, 500 tons of galvanized wire, 10,000 kegs of nails and nearly 800 tons of steel. This is the recent business signed up by one house alone. Other houses have been selling China bars, shapes, plates and sheets. It is said that millions of dollars worth of machinery has been sold in China since the armistice, and the machinery purchases today are running large. With some exporters this kind of business has been the most prosperous they have had with that country. China has sent in an inquiry for 1500 kegs of wire nails and 3000 tons of bars. It was recently announced that 18 000 freight cars had been ordered in the United States for that country.

A greater interest is shown today in the South American business than probably ever before. The field is fairly generally open and the independent export houses are enabled to go in there and develop business. Among the recent sales made to Cuba and South America was 6000 tons of barbed wire. Most of this was either painted or naked wire. Heretofore South Americans have insisted upon galvanized wire.

Argentine has purchased 9000 tons of steel bars. The barbed wire orders received from Brazil and Argentine would total several thousand tons. Brazil has been purchasing tin plate in quantity in addition to wire. One house sold Brazil 3000 cases of tin plate and over 300 tons of varnished wire. Chile purchased 15,000 boxes of tin plate.

Railway equipment men are planning to take the foreign exchange situation in their own hands to organize a banking corporation which will finance their foreign sales. Among the equipment manufacturing companies interested in this plan are the American Car & Foundry Co., the Baldwin Locomotive Co., the Railway Steel Spring Co., the Haskell & Barker Car Co., and the Standard Steel Car Co.

One of the largest prospective orders for equipment emanates from Belgium, and calls for 400 locomotives. It would place 200 immediately if desired credits were granted. Poland, which recently placed 150 locomotives with the Baldwin Locomotive Co., is in the market for several hundred more. Some of the Balkan states are making tentative inquiries.

Action on Steel Strike Indefinite

Federation of Labor Officials Hold Conference and Announce They Will Issue Statement, But it is Believed Final "Show-Down" Will be Delayed—Mitchell's Death Makes For Delay

WASHINGTON, Sept. 10.—At the conclusion of their conference Tuesday on the calling of a strike in the iron and steel industry, officials of the American Federation of Labor and representatives of unions having members in the industry announced that they would issue a statement in regard to their intentions Wednesday.

When word of the death of John Mitchell was received from New York Tuesday it was thought the conference would be postponed, but later the representatives decided to discuss the situation, even if no decision was made. It is taken for granted that the statement to be issued today will not contain a strike ultimatum.

Conservative leaders among the labor union officials, including President Gompers, it is understood counseled further deliberation, and the death of one of the federation's foremost leaders occurring just as the representatives were about to consider final action is believed to have had some effect in delaying action. The conservatives are understood to have sought the postponement of the conference for a month.

John Fitzpatrick, the chairman of the committee in charge of organization efforts in the steel industry, said "progress" had been made at the conference. He would not deny or affirm that it was decided to issue notice that unless President Wilson agreed to intervene within 48 hours a strike call will be issued. This report is taken to discredit earlier reports issued from the federation's headquarters that President Wilson had agreed to use his good offices toward obtaining a conference between the union officials and E. H. Gary, chairman of the United States Steel Corp.

Differences in Federation Reported

WASHINGTON, Sept. 9.—The meeting here today of 24 presidents of international unions included in the iron and steel industry is supposed to determine whether or not a strike will be called. Despite this, the belief still prevails that the principal differences are not between the American Federation of Labor and the iron and steel manufacturers, but rather that they lie between the radical and conservative elements of the federation. The former apparently are ready to attempt a strike, while the latter hesitate to resort to such action, believing it would fail.

A telegram was sent to President Wilson last Friday by the executive committee, signed by President Samuel Gompers and other members of the steelworkers' committee, following a two-day meeting, asking President Wilson to report what success he had achieved toward effecting a conference between the workers' representatives and Chairman E. H. Gary, of the United States Steel Corp. The President replied the following day, but what he said has not been disclosed.

It is thought that Gompers sent the telegram in an effort to force a meeting between the committee and Judge Gary, the influence of the President being sought to attain this end. Judge Gary has consistently refused to grant such an interview with the committee, holding that it does not represent the employes of the Steel corporation. It also is thought that some members of the committee are so radical in their views that no possible good could arise from such a conference.

Attempting to Magnify Situation

While the impression has prevailed that today's conference of the 24 union presidents was called after the telegram had been sent to the President, the fact of the matter is that the conference was called before. Right upon the heels of the calling of this conference and the exchange of telegrams with President Wilson, the statement was made by John Fitzpatrick head of the steelworkers' committee, that "We have every hope of arranging a settlement." Whether there was anything in the President's reply to prompt Mr. Fitzpatrick's announcement is not known, but in some quarters it was taken as further evidence that union representatives have been attempting to magnify the steel strike situation.

President Questions Union Tactics?

It is a question as to whether the President does not resent the tactics of the union men in trying to force a conference with the manufacturers, using him as a means to this end, instead of waiting for the general labor conference to be held here Oct. 6. Gompers' telegram follows:

The Gompers telegram to the President follows:

"The executive committee representing the various international unions in the iron and steel industry met today to consider the awful situation which exists in many of the iron and steel industry centers. The coercion, the brutality employed to prevent men and unions from meeting in halls engaged, upon private property, in the open air the thuggery of the corporation's emissaries, the wholesale discharge of numbers of men for no reason than the one assigned, that they have become members of the union, have brought about a situation that it is exceedingly difficult to withhold or restrain the indignation of the men and the resistance that they declare it is their purpose to prevent.

"The executive committee, relying upon the case as presented to you last week, and your earnest declaration to endeavor to bring about a conference for the honorable and peaceful adjustment of the matters in controversy, have thus far been enabled to prevail upon the men not to engage in a general strike. We cannot now affirm how much longer we shall be able to exert that influence, but we urge you, even in the great work in which you are engaged, to give prompt attention to this most vital of issues; for, if the men can no longer be restrained, it is impossible to foretell what the future may hold in store for an industrial crisis which may ensue and frustrate the project which you have worked at for peaceful and honorable adjust-

ment of industrial affairs in our country.

"A meeting of all presidents of the 24 international unions in the steel industry has been called to take place on Tuesday, Sept. 9, in Washington, D. C., to take such action as they may deem necessary. May we not have your reply on or before that time as to whether or not a conference with the Steel corporation is possible."

Employers Fear No General Strike

PITTSBURGH, Sept. 9.—Recent developments in the labor situation in this district all have been favorable from the viewpoint of the steel manufacturers and apprehension regarding a general strike of steel plant workmen rapidly is subsiding. Even the report that the President may have given some sort of a promise to organized labor leaders to bring about a conference between them and officials of the United States Steel Corp., is not disturbing.

It is pointed out that the corporation officials have yet to admit either by act or word that a controversy exists between the company and organized labor and therefore that the only purpose a conference, if one is called, can serve is to allow the labor leaders to air before Judge Gary in person the views they already have submitted to him in writing. Recognizing no controversy, it is argued, the company would be absolutely within its rights in declining to enter into a conference, even if called by the President.

Leaders of the movement to unionize the iron and steel workmen of the country continue to tell of the tremendous task they have in keeping the men from striking, but talk of this sort is discounted in steel trade circles here. The fact that the significance also is attached here to the full attendance of workmen at the various plants in this district on Labor day and the day afterward. If the men were so eager to go out, as claimed, a good many of them undoubtedly would have been absent that day.

They worked that day and also came back in full ranks on Tuesday, even at one of the plants, where a strike was called for that day in sympathy with the striking coal miners.

It is doubtful if the claims of the union leaders at any time could be substantiated, but it may be said that the movement has less force now than it had at the crest of the wave of organizing activities. It is said that English-speaking workmen who joined the unions during a moment of enthusiasm, aided by the information that the initiation fee of $3 was a special one and just for the occasion, now are beginning to regret the step, especially since they have learned that the local officers of the new branches in most instances were foreigners, both in speech and ideas. Pittsburgh is hoping that Judge Gary will refuse to confer with labor leaders even at the suggestion of the President and thus bring the matter of a strike to a head.

Incline to Basing Custom

WASHINGTON, Sept. 9.—If the present trend of the arguments on the question of basing steel prices at Pittsburgh is maintained throughout the controversy, and the federal trade commission which is to hear the case is governed accordingly, it appears the present trade custom will remain unchanged.

Among the views opposing the trade custom are those expressed by Franklin D. Roosevelt, acting secretary of the navy; Maj. Gen. George W. Burr, representing the war department, and Walter D. Hines, director general of railroads. The Emergency Fleet corporation, one of the largest purchasers of steel during the war, is noncommittal in its letter on the subject.

Consumers who have expressed views in opposition to the trade custom include the Johnson Iron Works, Ltd.; Southern Iron & Equipment Co.; Carolina Wholesale Hardware Co.; J. S. Schofield's Sons Co.; Southern Bridge Co.; McVoy Sheet & Tinplate Co.; Bailey, Burruss Mfg. Co.; Cary Safe Co.; Fuller & Sons Mfg. Co.; Gibbes Machinery Co.; Carbo Steel Products Co.; Great Western Manufacturing Co.; J. H. Williams & Co.; E. C. Adams, of Kansas City; Tomlin Harris Machinery Co.; Sales Iron Works; Lombard Iron Works & Supply Co.; Riddell Bros., Inc.; Oscar Daniels Co., and Athens Foundry and Machine Works.

Thirty-three individual views have been submitted favoring the basing point custom, while in addition some of the manufacturers answering and expressing views submit letters from customers indicating their disposition to favor the practice. The individual views submited are by the Superior Steel Co.; Pittsburgh Steel Co.; Knoxville Iron Co.; N. and G. Taylor Co.; Gulf States Steel Co.; Lackawanna Steel Co.; Jones & Laughlin Steel Co.; Union Drawn Steel Co.; National Bolt & Nut Co.; Bonner Steel Co.; W. A. Collings Co.; Weirton Steel Co.; Wheeling Steel & Iron Co.; Central Tube Co.; Indiana Bridge Co.; Republic Steel Co.; Youngstown Sheet & Tube Co.; Bethlehem Steel Co.; Trumbull Steel Co.; Reading Iron Works; Stark Rolling Mills; Atlantic Steel Co.; West Virginia Rail Co.; Mansfield Sheet & Tin Plate Co.; Eastern Steel Co.; McKeesport Tin Plate Co.; American Steel Co.; Carnahan Tin Plate & Sheet Co.; Morris & Bailey Steel Co.; Kokomo Steel & Wire Co.; the Bolt, Nut and Rivet institue; Crawfordsville Wire & Nail Co., and the Chamber of Commerce of Pittsburgh. Other steel companies have applied to the commission for copies of the original complaint, but have not filed views. The commission desires to hear from some others and letters may be sent to them.

Manufacturers Are Exempt

Pittsburgh, Sept. 10.—(By wire).—An opinion handed down by Judge Charles P. Orr in the United States district court here yesterday in the case against the Basic Products Co. is in favor of the defendant, and holds that the law creating the federal trade commission neither empowers nor gives a party the right to investigate into the affairs of any manufacturing company even though the products of the company may find its way into interstate commerce.

"Imagination cannot suggest an extension of constitutional limitations as may justify the investigation undertaken by the commssion in this state," said the court. "Indeed, so far as the matter has been brought to the attention of the court, no such assertion of power has ever been made to the court. The investigation under subdivision A, section 6, is limited to corporations engaged in interstate commerce. The defendant is engaged in manufacture."

Installing and Operating an Industrial Cafeteria

Information Regarding Equipment Required, Method of Operating, System of Financing and Cost of Installing a Modern Lunch Room for Employes

BY E. F. ROSS

Fig. 1—An Industrial Cafeteria Affords Good Food at Moderate Prices

WITH the movement of recent years for employers to take a greater amount of interest in the personal welfare of their employes has come the need for industrial dining rooms or cafeterias. Not many years ago lunch rooms maintained by corporations for their employes were quite unusual. During recent years, however, a great many restaurants have been installed and, although industrial cafeterias are yet in an early and experimental stage, the results already achieved indicate that the innovation has come to stay.

Two years ago, the Russ Mfg. Co., Cleveland, manufacturer of soda fountain equipment, added cafeteria equip-

FIG. 2—IN THIS INSTALLATION, THE KITCHEN AND SERVING TABLE HAVE BEEN COMBINED THEREBY SAVING SPACE, LABOR AND TIME

ment to its line of products. The company adopted the policy of building equipment to fit the place rather than to build a standard equipment which might be installed universally..

The cafeteria unit consists of a steam table, bread space, salad pan, pastry counter, milk and ice cream cabinet, coffee urn and check desk besides a complete kitchen equipment. This unit is designed with a view of serving 20 persons in a minute; in fact, 219 have been known to be served in eight minutes. Thirty minutes being the usual factory lunch hour, 250 persons are considered the maximum number to be served by one unit during this time. It has been found that the average workingman finishes his lunch in from 8 to 10 minutes and, assuming he is the last man to be served, he still has time to be out of the dining room at least 5 minutes before the whistle blows.

By operating two shifts during the lunch hour, one unit can be made to accommodate 500 persons, providing sufficient dishes and silverware is supplied for that number. The time between the serving of the last person of the first shift and the first person of the last shift is sufficient for replenishing the food supply from the kitchen even though the shifts are during consecutive half hours. In a few industrial cafeterias the tables are bussed or cleared by dining room attendants, but usually each person returns his tray and dishes to the dish cart. The tables are therefore expeditiously cleared for the next shift. It has been found most satisfactory, where two shifts were required, for the first shift to consist of the factory workers and the second of foremen and office employes. In large plants where the number of employes is large, additional units must be installed, one for each 250 persons with a single lunch hour system or one for each 500 persons with a double lunch hour system. When several units are required, as in the case of very large plants, it is best to distribute them about the factory so that employes can reach them quickly. It is considered a better policy to take the food to the employe than to require the employe to go after the food. Whether the units are close together or separated, the cooking can be done in a centralized kitchen and carried to the units on carts. The single kitchen plan makes it possible to serve exactly the same food in each dining room at the same time and, because larger quantities of food are prepared, tends toward economy.

Careful Watch is Maintained

Manufacturers who were pioneers in installing industrial cafeterias experienced difficulty in properly operating them. Inasmuch as lunch rooms of this type were new, expert advice was not available. Experience has proved that after installing a cafeteria, it is desirable either to hire an experienced restaurant man to manage it, or to consult an expert who is qualified to act in an advisory capacity. Most of the manufacturers who have purchased equipment from the Russ Mfg. Co. have adopted the latter plan. By this arrangement the restaurant expert supplies the special labor including cooks, dishwashers, etc., and supervises the operation of the cafeteria. Food supplies are purchased by the purchasing agent of the manufacturing company, but a daily form statement must be submitted to the restaurant expert to show the amounts and costs of purchases, the amount used, the number of meals served and the receipts. This statement is highly itemized in order that a very careful study of costs can be made. Suggestions and criticisms are given freely to reduce the cost of maintenance and materials.

FIG. 3—A SERVING UNIT IN THE PLANT OF THE NATIONAL ACME CO., CLEVELAND. THIS AND OTHER UNITS THROUGHOUT THE PLANT RECEIVE FOOD FROM A CENTRAL KITCHEN

FIG. 4—AN INDUSTRIAL CAFETERIA OF THIS TYPE AFF AND AVOIDS THE NECESSITY FOR EMPL

Serving has been reduced to a science. The unit is provided with racks for salads and pastries to facilitate placing them on a tray. Serving spoons and ladles are of the proper size so that one dip into a pan or bowl is just sufficient for one helping; more than one dip is a waste of time. Coffee is drawn from the urn as the line starts past the serving table so that it is still hot when carried to a table. The menu is posted in a conspicuous place, as shown in Fig. 1, to avoid delays in ordering.

A one-unit system requires the services of five or six employes permanently, but during the lunch hours extra help frequently is needed to facilitate serving. Rather than engage outside assistance some companies prefer to loan to the cafeteria staff for an hour or so each day the services of four or five women employes willing to assist in serving in exchange for their own lunches. This plan materially lessens overhead expenses and also makes it possible to serve company guests in private dining rooms.

As a rule, no attempt is made to repay the initial installation costs, rental for the space, or even depreciation or

LL OF THE CONVENIENCES OF A COMMERCIAL RESTAURANT LEAVING THE PLANT DURING LUNCH HOUR

breakage of the equipment. Most manufacturers consider these expenditures made in the light of an investment in factory equipment, and allow a certain sum of money annually for depreciation and breakage. The space is donated. It is the aim of restaurants to operate on a minimum or very reasonable margin of profit. In most cases the profit is placed in an employes' recreation fund or credited to a similar account. Some companies use portions of the profits to provide entertainment, occasionally during lunch hours, including music, readings or even cabaret shows. One corporation found that cabaret show during the first lunch hour following pay day encouraged piece work production. Some manufacturers prefer to donate a certain sum of money each month toward the overhead expenses of the restaurant, with the understanding that food will be sold to workers at prices low enough to insure a deficit equal to the donation.

The dining room should be sufficiently large to prevent congestion around tables and in the aisles. In good practice, 9 square feet is considered the minimum space which should be allowed per person and 4 feet the width of all aisles. A room arranged according to these specifications is quite comfortable. Decorations should be simple but attractive. A dining room should be used in double capacity, as a dining room and a recreation center, thereby not only economizing in space but acquainting employes with the fact that the cafeteria is provided for their use. Some factories use the dining room for committee meetings, educational classes, reading rooms, rest rooms and occasionally for dances.

Although the cafeteria unit is finished in white porcelain for reasons of sanitation and cleanliness, the remainder of the equipment, including tables and chairs, may be of any design and quality which the company desires to provide. For dining rooms in which the furniture is not moved around to any extent, the tables and chairs often are of heavy, sturdy construction, but for others which must be cleared for dances and employes' gatherings, lighter furniture has been found to be advantageous. Collapsible tables and chairs fill the latter need admirably and at the same time are easily removed and replaced. Porcelain-topped tables, while adding to the air of cleanliness, give a dining room the aspect of the commercial restaurant and totally fail to produce a home-like atmosphere. A home-like room attracts the man in overalls whereas the other fails. Given the space for a one-unit lunch room feeding 250 persons at one time, a model cafeteria can be installed for approximately $5000.

Kitchen Can Serve Several Units

Additional units, also feeding 250 persons at one time and supplied by the one central kitchen can be installed for approximately $2500 each. The central kitchen, when called upon to feed more than 1000 persons at one time, requires additional equipment to facilitate the proper handling of food and dishes. The serving table for a single unit has a frontage of about 35 linear feet.

A study of labor conditions in factories in which cafeterias have been installed has developed interesting conclusions. Employes may bring any amount of food from home and buy any amount in the dining room, but the number bringing even a portion from home has greatly decreased. As a result, the habit for employes to eat part of the lunch before noon has been reduced to a minimum. Not only is the occasional lunching during the morning injurious to the workmen, but it loses time, consequently lowering production. When employes live close to the factory they usually go home for lunch, necessitating a rush home, a hastily swallowed meal and a rush back to work before the whistle blows. This practice also is undesirable for the health. With the advent of cafeterias, the workman has found that he can purchase a warm lunch for less than it can be prepared at home, that he has plenty of time to eat it without fear of indigestion and that his wife has more time to devote to her family and household duties. In some factories, which run day and night, the cafeteria or lunch counter is kept open 24 hours and employes are allowed to purchase food during any of the rest periods.

In operating an industrial cafeteria, the manufacturer must bear in mind the class of workers he must feed in order that they be given the proper food for maintaining their bodies in an efficient condition. Brain workers do not require quantity of food or food of high heat energy while the physical worker requires the reverse. When these two classes are served at different times, proper food can be prepared and served to each, but when they must be served at the same time, the problem re-

FIG. 5—A REAR VIEW OF A LARGE INSTALLATION TO SHOW HOW THE SPACE UNDER THE SERVING COUNTER IS UTILIZED

FIG. 6—A CORNER OF THE DINING ROOM IN A CAR BUILDING PLANT—MANY EMPLOYERS UTILIZE THEIR DINING ROOMS IN THE EVENING BY REMOVING THE TABLES, THUS MAKING THE ROOMS AVAILABLE TO THEIR EMPLOYES FOR DANCING

quires skillful attention. The manager usually handles this difficulty by offering a good selection of food to enable the worker to select the food he needs.

W. H. Wilcox, Cleveland, a cafeteria expert, who acts as advisor to a great number of manufacturers operating industrial cafeterias, firmly believes that the industrial restaurant has an important place in industry. "The industrial restaurant is an important asset to American production," claims Mr. Wilcox. "It is not an expense, it is not a liability; it is and can be made the medium for improving production in the plant."

Consumption of Gas in Case Hardening

Although the advantages afforded by the gas fired furnace for carburizing have been generally recognized in the past from such points of view as close temperature regulation, decreased attendance, convenience, etc., but little information has been published regarding the consumption figures for this process. The following information has been supplied by the Davis Furnace Co., Diamond Foundry, Luton, Beds, Eng. It deals with one type of furnace which this company makes provided with regenerators of an efficient design and fired with artificial gas at ordinary pressure. The air is introduced to the furnace under slight pressure, about 3 or 4 inches water gage. The figures recorded are for a case hardening job which required that the material be charged into a cold furnace, raised to 900 degrees Cent., and maintained at that temperature for eight hours to give the necessary depth of case. The work consisted of automobile gear wheels, packed in six boxes and having a total weight of 713 pounds.

The required temperature of 900 degrees Cent. was obtained in 70 minutes after lighting up. The figures for the entire run were as follows:

	Cu. ft. Per lb.	Total Cu. ft.
Gas to raise furnace and charge from cold to 900 degrees	1.29	925
Gas to maintain 900 degrees for 1st hour	.38	275
Gas to maintain 900 degrees for 2nd hour	.42	300
Gas to maintain 900 degrees for 3rd hour	.38	275
Gas to maintain 900 degrees for 4th hour	.42	300
Gas to maintain 900 degrees for 5th hour	.49	350
Gas to maintain 900 degrees for 6th hour	.49	350
Gas to maintain 900 degrees for 7th hour	.45	325
Gas to maintain 900 degrees for 8th hour	.45	325

The total gas consumption for this run of nine hours and 10 minutes was 4.8 cubic feet per pound of load. From these figures it is of course readily possible to calculate the approximate quantity of gas required for any period of carburizing and therefore for any depth of case.

Mechanism of Fracture in Steel Explained

An interesting paper on "The Mechanism of Fracture in Steel" was read before the Metallurgical Society of America recently by W. E. Ruder, research laboratory, General Electric Co., Schenectady, N. Y.

The paper begins with a review of the existing knowledge of the change of physical conditions in the variable constituents of steel when subjected to static or alternating stress.

Microscopic examination shows that steel is crystalline in nature and heterogeneous in composition. Each constituent has its own physical and chemical characteristics, and the results which we get from the test bar are really summations of the physical characteristics of the constituents. The mechanism of plastic yield is explained and the relation of the crystalline to the amorphous phase discussed. It is pointed out that alternating stress is one of the most accurate methods for the determination of the true elastic limit.

In discussing the different theories advanced to explain the great strength of the grain boundaries, Howe's modification of Rosenhain's amorphous theory is favored by Mr. Ruder. Thompson's surface tension theory is rejected on the ground that it adds very little to our knowledge and rather complicates our conception as to what actually happens. That surface tension actually exists, there is little doubt, but it is not believed that it is a determining factor. The author's own opinion as to what happens in the fracture of steel is that the first effect of stress is to cause a flow of amorphous material surrounding the grains, indicated micrographically by a ridging along the grain boundaries and a slight molecular yield in the space-lattice of the crystals. When the elastic limit is reached the amorphous cement, as determined by its strength and amount, breaks transversely, owing to its weakness in that direction and the load is suddenly thrown upon the crystal. The plastic yielding, due to slipping causes a sudden drop in the applied stress, which, after sufficient intercrystalline amorphization takes place again causes the applied stress to rise, but this time with considerable elongation.

Coincidence or Copy in Tin Hat?

Most Perfect Helmet in War Developed by American Experts Found Duplicated in Germany, Both Produced Too Late for Use—Lessons Gleaned From Ancient Armor Making an Aid in Modern Manufacture

THERE were but two great nations in the war which went to the Middle Ages for ideas as to protective armor, the United States and Germany. Another coincidence, and this was considered particularly strange to American ordnance experts, Germany late in the war produced a helmet almost identical with the best model that had been developed by Americans. The latest type of German helmet, however, was produced too late in the war to be of service. In the war department's forthcoming book on its activities in the war it is said:

"Germany at the start consulted her experts on ancient armor and worked along lines which they suggested. The German helmet used in the trenches was undoubtedly superior to any other helmet given a practical use. Yet it may be said that the development in this country eventually produced a helmet, entirely America's own, which, had the war continued six months longer, would have been produced in large quantities and which was far superior to any helmet used at the front. Yet it is a notable fact that the German armor experts, working, of course, entirely independently, late in the war produced a helmet almost identical with the best American model.

"The first helmets to be used in the great war were of French manufacture. They were designed by General Adrien, and 2,000,000 of them were manufactured and issued to the French army. These helmets were the product of hasty pioneer work, but the fact that they saved from 2 to 5 per cent of the normal casualties of such a war as was being fought at once impelled the other belligerents to adopt the idea. Great Britain, spurred by the necessity of producing quickly a helmet in quantity, designed the most simple helmet to manufacture, which could be pressed out of cold metal.

"When America entered the war she had, naturally, no distinctive helmet; and the English type, being easiest to make, was adopted to fill the gap until we could design a more efficient one ourselves. Consequently 400,000 British helmets were bought in England and issued to the vanguard of the American expeditionary forces.

"In one respect we had the advantage of the ancients in that we have at our disposal the modern alloy steels of great resistance. An alloy of this kind having a thickness of 0.036 inch is able to stop at a distance of 10 feet a jacketed, automatic pistol ball, 0.45 caliber, traveling at the rate of 600 feet a second. This was important not only from the standpoint of helmet production, but from the further inference that body armor of such steel might be profitably used at the western front. The records of the hospitals in France show that seven or eight of every 10 wounded soldiers were wounded by fragments of shell and other missiles which even thin armor plate would have kept out. The German troops used body armor in large numbers, each set weighing from 19 to 24 pounds. In this country we believed it possible to produce body armor which would not be difficult to carry and which would resist the impact of a machine-gun bullet at fairly close range.

Adopted British Model

"The production of helmets, however, was our first concern; and in order to be sure of a sufficient quantity of these protective headpieces, we adopted the British model for production in the United States and went ahead with it on a large scale.

"We began receiving substantial quantities of finished helmets by the end of November of the first year of the war. On Feb. 17, 1918, practically 700,000 had been shipped abroad or were ready for shipment at the ports of embarkation. Later in the spring of 1918, when we began sending men to France much beyond our earlier expectations, the orders for helmets were greatly expanded. In July the total orders reached 3,000,000, in August 6,000,000, and in September 7,000,000. This gave us enough to meet all requirements until June, 1919.

"When the armistice was signed the factories were producing more than 100,000 helmets every four days, and were rapidly approaching the time when their daily output would be 60,000. The government canceled all helmet contracts as soon as the fighting ceased, having received up to that time a total of 2,600,000 of them.

"We also produced helmets for special services, one with a visor to protect machine gunners and snipers, and another, known as model 14, for aviators, it being little heavier than the leather helmet which airmen wore in the war and 20 times as strong a defense for the head. A third special helmet, known as model 15, was for operators of tanks. It was provided with a neck guard of padded silk to stop the lead splash which penetrated the turret of the tank.

"The engineering division of the ordnance department developed a body defense including a light front and body plate, these together weighing 9½ pounds. One lot of 5000 sets was manufactured and were shipped abroad for testing; but the report was not favorable, as the American soldier did not wish to be hampered with armor, and it was almost impossible to induce him to wear it.

"A few defenses for arms and legs were prepared which, although light in weight, would protect the wearer from an automatic-pistol ball at 10 feet. Seventy per cent of the hospital cases in France were casualties caused by wounds in the arms and legs. These defenses, however, were rejected on account of their impeding to a certain degree the movements of the wearer.

"Our development in armor also produced an aviator's chair weighing 60 pounds. It would protect the pilot from injury from below and from the back, withstanding armor-piercing bullets fired at a distance of 50 yards. Since the piercing of the gas mask canister by a bullet might result in the death of the soldier by admitting gas directly into the breathing system of his mask, the ordnance department designed an armored haversack for the gas mask and its canister, this haversack incidentally serving as a breast defense.

"Another large ordnance operation was the production of bayonets for the service rifles. The British bayonet had proved to be highly satisfactory in the war; and, since it was already designed to fit the Enfield rifle, which we had adopted for our own, we took the British bayonet as it was and with only one slight alteration, set out to produce it in this country.

"The government found both the Remington Arms-Union Metallic Cartridge Co. at its Bridgeport, Conn.,

works, and the Winchester Repeating Arms Co. building these bayonets for the English government. The latter's bayonet needs by 1917 were being well supplied by home manufacture, and this permitted us to buy approximately 545,500 bayonets which had already been manufactured for the British.

"The ordnance department at once started out these two concerns on contracts for bayonets for the American government, Remington with total orders for 2,820,803 bayonets and Winchester with orders for 672,500. Remington delivered in all 1,565,644 bayonets and Winchester 395,894. This was a total of 1,961,500 bayonets.

"The total production of 1917 rifles was about 2,520,000. These figures indicate that we were short over 500,000 bayonets at the time hostilities ceased; and as a matter of fact this shortage had already become acute, especially in the training camps.

"The bayonets had not come as rapidly as we had expected, because to produce them at the rate originally planned would have interfered with the more essential production of rifles by these same companies. Accordingly in 1918 additional contracts for 755,000 bayonets were made. The latter contracts, however, were suspended after the armistice was signed.

"While this production was under way we were also manufacturing bayonets for the model 1905 Springfield rifle. The Springfield armory produced 347,533 of these and the Rock Island arsenal 36,800. In addition the Springfield armory delivered 50,000 bayonet blades as spare parts."

Iron and Steel Famine Exists in Russia

BY JOSEPH HORTON

British Correspondent of The Iron Trade Review

REMARKABLE statements are reaching England via Copenhagen of the demand in Russia for iron and iron materials of all kinds. Enormous destruction of machinery has been caused by ruthless Bolshevism, and very few machines remaining in some districts can be used without extensive repairs.

Farm implements cost from 20 to 200 times what they cost before the war. Nails cost 700 rubles per pound, and even at that price are almost unobtainable. Iron pipe costs 230 rubles per pound.

There is a famine in domestic utensiles and cutlery so that ordinary dinner knives formerly costing three-fourths of a ruble now sell for 50 or 60 rubles. The Soviet industrial commissary at Charkaw recently reported that 300,000 tons of pig iron is immediately necessary for certain indispensable industrial undertakings. A further report states:

"The re-establishment of Russia's manufacturers needs, first of all, a settlement of the iron and steel question, and as even the home mechanism of production has suffered it will be indispensable not only to import large quantities of iron and steel which can be had only from England or America but to invite foreign experts, a move entirely consistent with Comrade Lenine's new program. The re-establishment of the railways in the Southwest district is inconceivable without foreign help."

It is evident from further reports that Germany is being appealed to in various ways to render help.

* * *

Sir Robert Hadfield paid a compliment to the American patent system at a conference of inventors Aug. 1 in London. He said the Federation of British Industries favors a much longer term of years for British patents. It also is agreed as to the desirability of a more extensive examination of the report of applications made for patents.

He apologized for referring so often to America but said the more he studied the American system in the patent office at Washington the more pleased he was with it. Under the "file wrapper" system he said he had been saved costly litigation, because he was able to obtain information about certain people who were attacking patents in which he was interested.

A further point on which the federation is agreed is that a specialist judge should try patent cases. He said the provisional protection of six months granted in Great Britain should be increased. He called attention to the fact that American patent rights do not extend from the day of application, but from the day they are granted and added that an Englishman might waste 12 or 15 months before getting a patent. It was the consensus of opinion of those present that the cost of obtaining a patent in England should be reduced one-half.

* * *

Sir Robert Hadfield took 300 of his employes by special train from Sheffield to London recently.

* * *

Further progress has been made in the search for oil at Heath and Hardstoft, near Chesterfield. At the Heath No. 1 well a gas-fired boiler necessary for the drilling plant is being operated by means of natural gas escaping from the bore hole. At Hardstoft, where the boring is being carried down to 3130 feet the oil is bubbling up to the surface, and is conveyed by iron pipes to a tank of 200,000 gallons capacity. The flow continues at the rate of 400 gallons in 24 hours, but it is expected that when a new pump has been installed the flow will be greatly increased. The oil is coming up under a gas pressure of 1100 pounds to the inch and the effervescence at the mouth of the well gives the impression of boiling oil.

Natural Gas in Italy

Some years ago a natural gas stratum was struck at Aguano, near Pisa, Italy. It is now proposed to exploit this owing to the coal shortage. The 3-foot peat stratum containing the gas lies under a 100-foot bed of clay and rests on sand. When the boring tubes tapped the peat layer large quantities of gas rose up, having the following composition: Marsh gas (methane), 85 per cent; unsaturated hydrogen gas, 2 per cent; various gases (carbonic acid, etc.), 13 per cent. This natural gas burns in the bunsen burner with a weak flame, but develops twice as much heat as ordinary artificial gas. When used with incandescent mantles it gives a bright light. At present it is being collected in six pipes and conveyed to the Pisa gasworks, where it is led through the town mains. A further boring has been made which includes 12 tubes. Pisa will save $30,000 per annum by using this gas. The supply of gas from the deposit is sufficient to last some years. (*Nuova Antologia; Zeitschrift des Oesterr. Ingenieur-und-Architekten-Vereines.*)

According to the *Neues Pester Journal,* negotiations are being carried on between German and Rumanian merchants and the Hungarian government concerning a scheme to transport petroleum oil from Rumania over the inland waterways into Germany.

Fig. 1—General View of By-Products Plant Showing Loaded Coal Barges in the Harbor, Coal Unloading Dock, Coal Handling and Storage Plants and Ovens

New Coke Plant Serves Ohio River Furnaces

BEING one of the first by-product coke plants in the Pittsburgh district and the only modern plant of its kind in the Ohio valley, is the distinction which belongs to the new 94-oven plant of the La Belle Iron works, located on the south bank of the Ohio river, opposite the company's main plant at Steubenville, O. The new plant, which has two batteries each of 47 standard 12½-ton ovens, designed and built by the Koppers Co., Pittsburgh, and is planned to permit duplication, replaces beehive ovens formerly operated by the company at La Belle, Pa.

Officials of the La Belle company originally planned to build the plant on the Ohio side of the river, adjacent to the steel mill and furnaces, but the West Virginia site was decided upon when it was found impossible to secure enough land contiguous to the present plant to allow room for future expansion. The choice of the West Virginia site added considerably to the cost of the plant. A great amount of extra foundation work was necessitated and a fill of 15 to 20 feet over the entire site was required to bring the plant to an elevation above the flood stage of the river. The ovens were carried 8 feet above the new level in order to bring the stack flues above the flood stage. More than 900 yards of filling material and 70,000 yards of concrete were used in the construction of foundations. Void wall construction was used in the oven foundation which extends to a depth of 28 feet below the oven matt, the voids being filled with granulated slag. Piers and curtain walls were used in the foundations of all the buildings and the floors laid on a granulated slag fill. All underground conduits and piping were laid before the fill was made, being erected on concrete piers.

FIG. 2—A SECTION OF THE COKE WHARF

To provide traffic communication between the two plants and insure an uninterrupted supply of fuel for the furnaces, it was necessary for the company to erect and maintain its own bridge across the river. This structure, which is of the cantilever type, is 1520 feet long and consists of four 100-foot girder spans, two 30-foot anchor spans and a main-channel span 660 feet long. It was planned and built by the American Bridge Co., New York, and is the first cantilever bridge ever erected without a traveler or creeper, a crane with a 110-foot boom being used in its erection throughout. The supporting piers are of reinforced concrete, 120 feet high and were sunk to bed rock, a distance of 43 feet below pool level, the caisson method being employed.

A unique feature of the new plant is the coal handling system. The coal used, excepting a small percentage which is mined in the nearby West Virginia fields and brought to

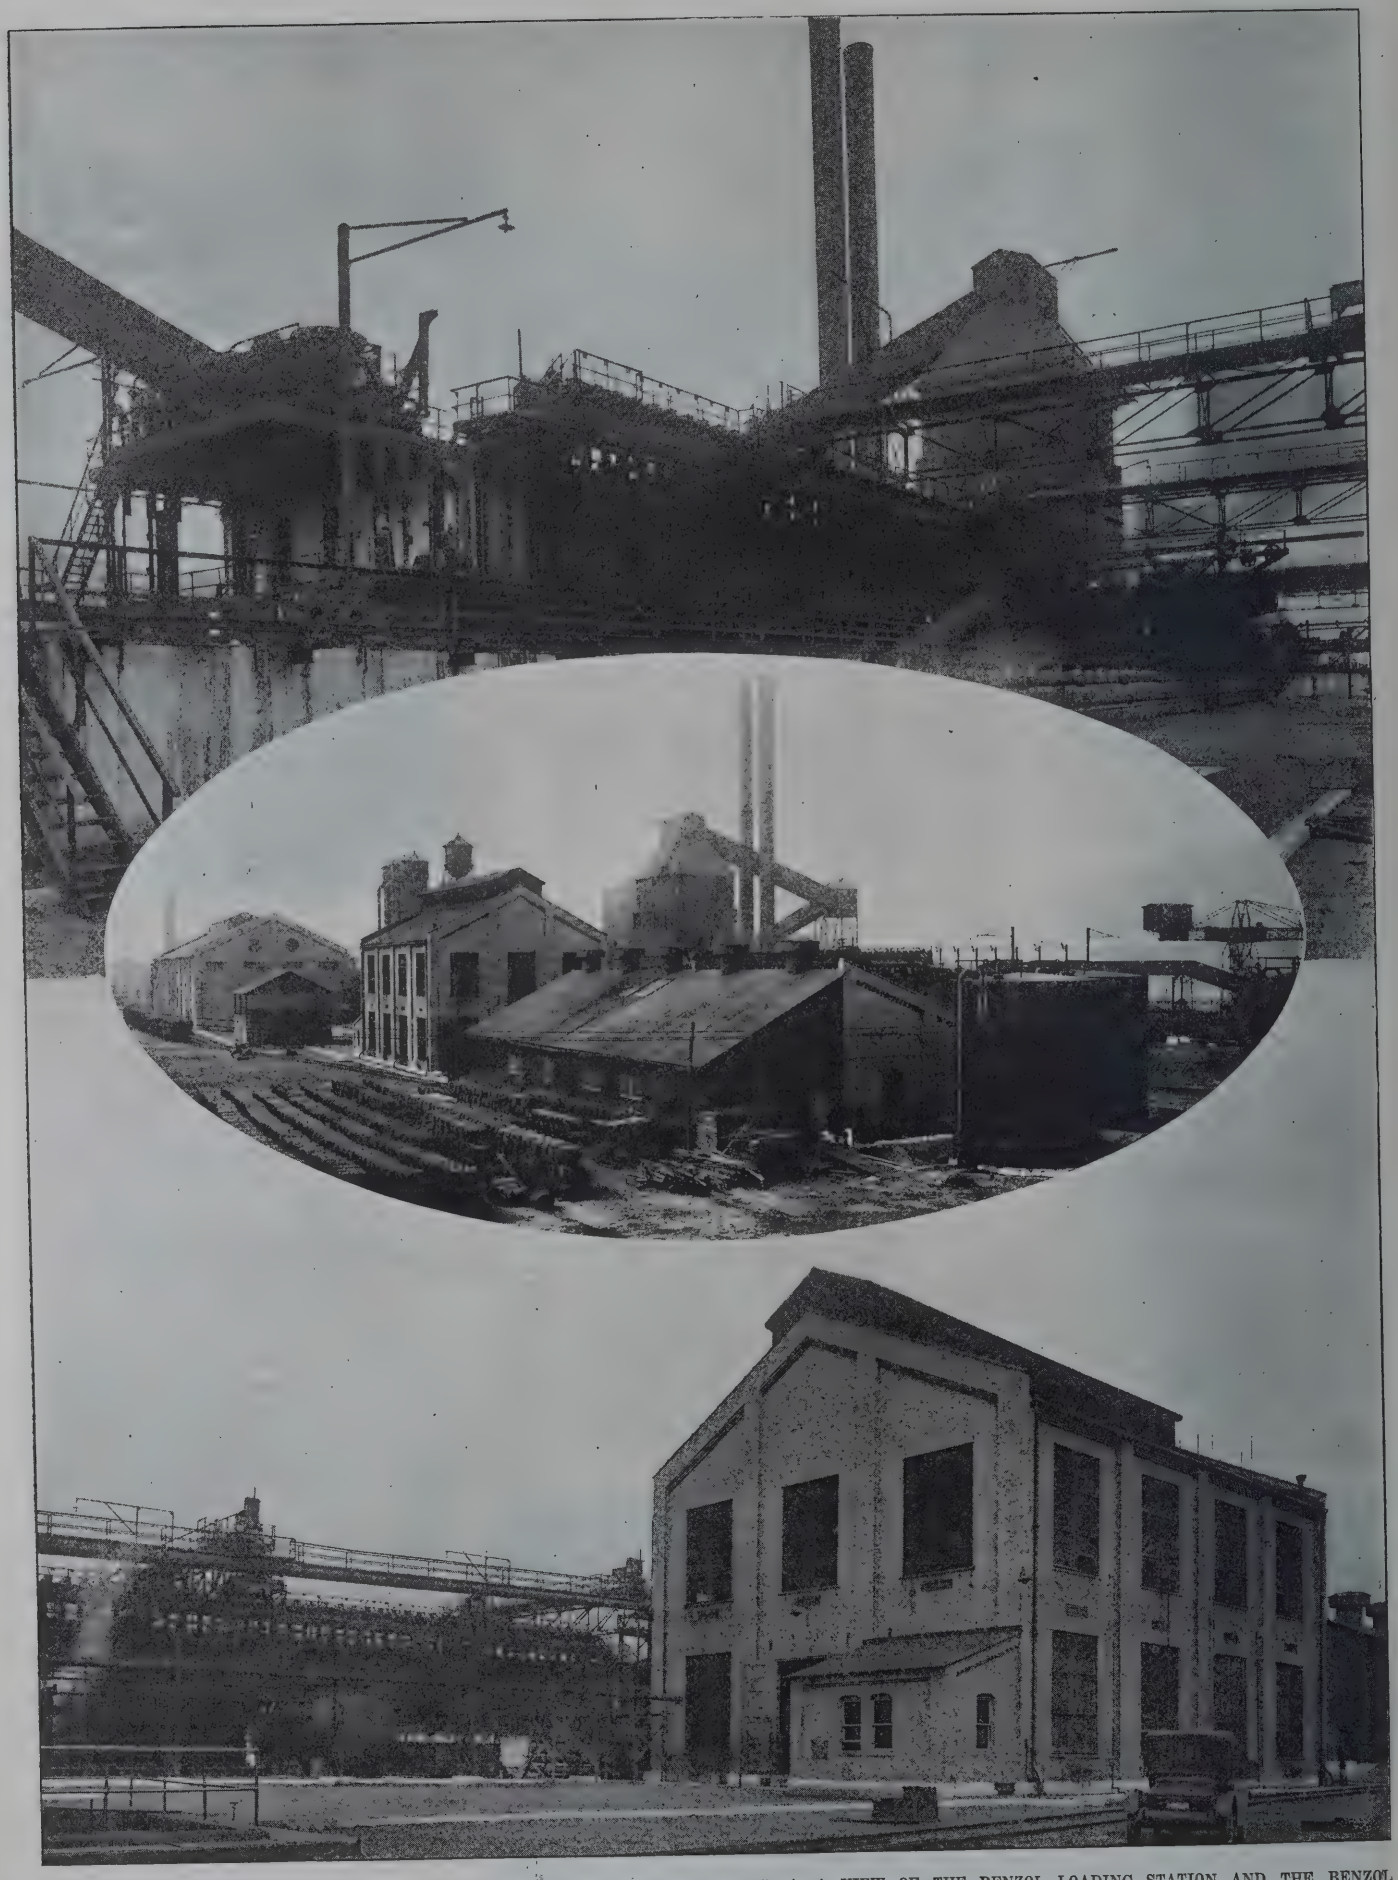

FIG. 3—COKE SIDE OF THE BY-PRODUCT OVENS AND THE COAL GALLERIES FIG. 4—A VIEW OF THE BENZOL LOADING STATION AND THE BENZOL BUILDING IN THE REAR FIG. 5—BENZOL BUILDING SHOWING WASH OIL COOLERS, CIRCULATING TANKS AND OVENS

the plant by railroad, is transported over the Monongahela and Ohio rivers from the Pennsylvania coal district. For this purpose, barges having a capacity of 350 to 600 tons are used, the barges being towed down the river in fleets of six to ten. Harbor facilities are provided where approximately 30 loaded barges may be tied up awaiting their turn at the unloading dock, while the same number of empties also can be accommodated. A truck hopper handles the coal shipped in by rail and a storage yard of 100,000 tons capacity is provided to insure an adequate supply for use during the winter months when the river may be closed to navigation.

Coal is unloaded from the barges by two traveling gantry cranes, with 100 foot bridge built by the Heyl & Patterson Co., Pittsburgh. These cranes are each mounted on four 2-wheeled trucks. They also may be used to handle coal in the stock yard. They are equipped with 3½-ton buckets and have a hoisting speed of 500 feet per minute. The buckets are specially designed with a view to clean unloading in minimum time with minimum labor.

When unloading, the crane remains stationary on the dock, the barge being moved along the dock by an electrically operated barge shifter. Under normal conditions the coal is dropped into a small hopper located on the dock. It is then fed through the bottom of this hopper onto a 30-inch conveyor belt which discharges into the track hopper. If it is desired to stock the coal, empty cars are placed over the track hopper and the coal discharged from the conveyor into them.

Loaded cars are moved by means of a cable haul to one of the several unloading pits which are located every 125 feet along the entire length of the storage yard. From these pits it is transferred to the storage pile by one of the gantry cranes, When it is desired to use coal from stock this operation is reversed, the crane loading the cars which are then transferred to the track hopper and unloaded.

The unloading dock, which is 100 feet long and has a 100-foot fender at each end, was built by the National Contracting Co., Cleveland, while the coal-handling and storage-yard systems were designed and built by the Heyl & Patterson Co.

From the track hopper, coal is carried by a short-length pan conveyor to a 36-inch conveyor belt, which is driven by two 50-horsepower motors made by the General Electric Co., Schenectady, N. Y. The belt travels on a 20-degree incline to the top of the breaker building where it delivers the coal to a breaker. The coal is broken into 1½-inch lumps and the slate and sulphur is removed. From the breaker the coal is carried by a conveyor belt to the proper one of three mixing bins. From the latter it is fed by gravity into the regulator by adjustable gates so that any desired percentage of each grade of coal can be secured. The three-mixer belts discharge into the same chute which leads to the hammer mills where the coal is pulverized to a fineness of 85 per cent through a ⅛-inch screen. It is then elevated by conveyor belts to an 1800-ton storage bin located above the charging floor, between the two batteries of ovens.

The chutes on either side of the hammer mills are equipped with rotary feeders which insure an even and constant feed and eliminate about 90 per cent of the dust. All the coal handling equipment is individually motored and the control is interlocked in such a way that no conveyor belt or crusher can be started or operated until the machine next in progression is in operation. By means of this arrangement spillage or accumulation of coal, if one machine should stop is eliminated. Three-phase, 220-volt, alternating current is used throughout the coal-handling plant. All control boards for the various motors are housed in the control building which is located at a sufficient distance from the main plant that the delicate electrical-control instruments may not be injured by coal dust; a push button located near each motor enables the operator to stop and start the machine at will.

The pulverized coal from the storage bin is fed by gravity into one of the two charging machines. The ovens are of the standard Koppers 30-flue type. The heating system is so arranged that gas is burned in the 15 flues at one end of the furnace and the heated air and products of combustion pass out through the remaining 15 flues to the flue stack giving off heat as it goes. This arrangement is reversed every 30 minutes, insuring a continuous even heat at all times. This change is made automatically, the gas valves, stack dampers and draft dampers being controlled from the control house which is situated between the two batteries of ovens. The entire operating mechanism is governed by an electric clock, no attendant being required. The machines which operate these valves and dampers are electrically driven, but a steam engine is provided for use in emergency. In the central building are also located a venturi-type gas meter for recording the gas consumed and other devices for indicating the temperature, gas production, etc.

The discharging, quenching and handling machinery is all standard Koppers equipment. The coke after quenching and cooling is dumped

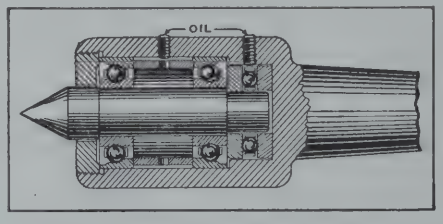
FIG. 6—GENERAL VIEW OF PLANT SHOWING POWER STATION, TIME AND GENERAL OFFICES AND BY-PRODUCT BUILDINGS

onto a wide chute from which it is fed through gates onto a conveyor belt. The latter transfers it to the grader where it is graded into various sizes. Part is transported across the river to the furnaces, part is sold for commercial consumption and the breeze is used in the power plant.

The by-product gas, which is given off at about 1000 degrees Cent., is drawn through a 16-inch main by two steam-driven blowers. The latter were built by the Connersville Blower Co., Connersville, Ind., and displace 128 cubic feet of gas per revolution. The fan is driven by means of a 250-horsepower compound engine, and forces the gas through water tube coolers where it is cooled to about 28 degrees Cent. The sudden cooling condenses the tar vapors, the tar flowing into a settling reservoir. Here the gas liquors which are lighter than the tar, rise to the top of the condenser and are drained off. The tar in this state is pumped to the nearby plant of the American Tar Product Co.

The gas, relieved of its tar contents, passes into the reheater, where it is brought to a temperature of 60 degrees Cent. It is forced into the saturator where the ammonium sulphate is removed and then into a centrifugal dryer where the ammonia liquor is distilled. The pure ammonia gas is used again. Electric current at 22,000 volts, 60 cycles and 3 phase, is supplied by the West Penn Power Co. from its Beech Bottom, W. Va., plant, and is stepped down to 2200 and 220 volts, by a series of transformers built by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Develops Center Which Turns With Work



To eliminate friction originating at the tailstock lathe center, a ball bearing center has been designed by Kell, Hock & Co., Newark, N. J. This center, as shown in the accompanying illustration, turns with the work. A high-speed ball and thrust bearing carries the radial and thrust load of the work in the lathe. The advantages claimed for this device are that centers cannot be burned or enlarged and that chattering is reduced to a minimum. Precision work is facilitated with the new center. No oil is needed at the center and since the bearings run in an oil bath, little attention need be paid to further lubrication except at long intervals. Wear in the bearings is adjusted readily by turning the front plate a few degrees. The manufacturer claims that a lathe can be run at extremely high speed without any trouble developing at the center. Four sizes are made for use with all sizes of lathes.

Celebrate Centenary

Of Founding of Connecticut Hardware Manufacturing Company

Southington, Conn., a thriving little manufacturing town of 6500 inhabitants, now boasts a unique soldiers' memorial in the form of a granite pedestal inscribed with the list of 139 revolutionary war heroes followed by the names of every man Southington has sent to any war in which Uncle Sam has engaged since 1776. There are 921 names in all, 425 of them representing her contribution to the world war.

The memorial was dedicated on the afternoon of August 30 as a part of the 3-day festivities that jointly

BALL AND THRUST BEARINGS SUPPORT THE RADIAL AND THRUST LOADS

marked the welcoming home of Southington's soldier sons, the celebration of the 198th anniversary of the founding of the village, and the centenary of the birth of its leading manufacturing interest, the Peck, Stow & Wilcox Co., makers of hand tools and tinners' machines. The formal presentation to the village was made by Gov. M. H. Holcomb, of Connecticut, on behalf of the Peck, Stow & Wilcox Co.

Friday, Aug. 29, the opening day of the centennial, was given over to an old-fashioned community basket picnic at Lake Compounce, a summer resort near Southington. During the afternoon Lyman H. Treadway, president of the company, presented every employe with a service badge. Twenty-three who had been in the company's employ more than 40 years were given gold badges. Five of these had been 50 years on the company's payroll. Fifty-three who had been in service 25 years or more were given sterling silver badges, and all others, down to the 4-year men, were given bronze badges. Each badge was inscribed with the name and the service record of the recipient. The unveiling and presentation of the monument on Saturday afternoon followed the parade of returned soldiers and sailors, one feature of which was an elaborate pageant commemorating the development of manufacturing in the Connecticut hardware belt and incidentally emphasizing local historical events. A reception to the public by officers and directors of the Peck, Stow & Wilcox Co. and a community dance in the newly added 5-story addition to the plant completed the day's program in Southington. President Treadway was later toastmaster at a banquet to the officers and directors at the Hartford club.

The Peck, Stow & Wilcox Co. has distributed a booklet entitled "One Hundred Years of Progress," which sets down, briefly, the interesting history of the company since 1819. The concern represents the consolidation, in 1870, of the Peck-Smith Mfg. Co. of Southington, the S. Stow Mfg. Co., of Plantsville, Conn., and the Roys & Wilcox Co., of East Berlin, Conn. Samuel C. Wilcox was president of the Roys & Wilcox Co. at the time of the consolidation.

Besides Mr. Treadway, the present officers of the company are L. E. Fichthorn, vice president, and E. N. Walkley, secretary-treasurer.

Seth Peck of the Peck-Smith Mfg. Co. patented in 1819 the first machine for making tin wire and in this was laid the foundation of the present organization.

Mining in British India

The annual report of the chief inspector of mines in India for 1917 gives many interesting figures regarding output. There was a substantial increase in the amount of coal mined over that of 1916, the amount for 1917 reaching 17,326,384 tons. This is an increase of 5.53 per cent over 1916.

A decrease is shown in the amount of manganese mined, the total being 497,252 tons as compared with 568,032 tons in 1916. This is a decrease of 12.49 per cent. The output of wolfram increased from 59,094 hundredweights for 1916 to 79,312 hundredweights for 1917. The increase was most noticeable in the first half of the year.

The gold output decreased slightly being 22,991 ounces against 23,235 ounces for 1916, a decrease of 1.05 per cent. The copper output increased to 20,108 tons from 2671 tons in 1916. The increase is nearly 653 per cent. There were increases shown in limestone, iron ore, magnesite, molybdenite, chromite, clay, tin, steatite and fullers' earth and decreases in slate, salt, bauxite, galena, silver and graphite.

Foundry Seeks Difficult Work

Extensive Study of the Purposes for Which a Casting is Intended and the Properties Desired in the Part is Made Before Production is Attempted in This Steel Foundry

By D. M. AVEY

NEW foundrymen seek trouble. In fact the average producer of commercial castings is generally content to wait until difficulty stares him in the face. Then, if he is reasonably energetic, he grapples with the problem, and not infrequently concentrates the energies of the entire shop organization on its solution. But in most plants, seeking troubles before they appear is looked upon as a needless waste of time and effort. In a certain steel foundry in Indianapolis which handles a variety of light and medium work, this condition is reversed. This foundry, operated by the Electric Steel Co. of Indiana, literally hunts for trouble, and by meeting it more than half way overcomes it in its incipiency.

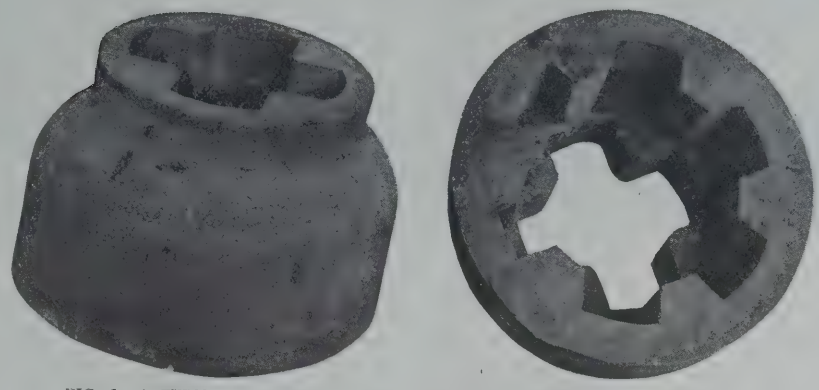


FIG. 1—A TYPICAL CASE WHICH WAS THOROUGHLY DIAGNOSED BEFORE AN ATTEMPT WAS MADE AT MOLDING AND CASTING

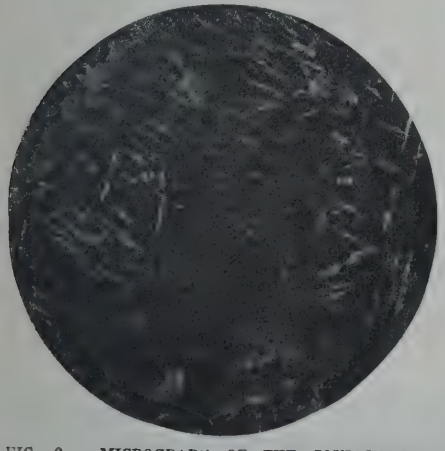

FIG. 2 — MICROGRAPH OF THE COUPLING-BOX CASTING WHICH FAILED — SPECIMEN WAS ETCHED WITH 2 PER CENT NITRIC ACID IN ALCOHOL AND MAGNIFIED 60 DIAMETERS

Any new job offering special difficulties in any of the processes of molding, casting or annealing is met with a spirit of real pleasure. Metallurgical troubles especially are welcomed, as are new problems capable of solution with the aid of chemical reagents and the micro-camera.

Fig. 1 shows a typical "case" brought to this plant and solved with satisfaction to the customer and apparently greater pleasure to the management. The illustration shows two views of a rolling mill coupling-box or as it is sometimes called a *wabbler* or *crab*. This coupling casting may vary in size from a few inches up to more than two feet in diameter. It slips over the end of the roll spindle and forms a connection with the driving pinion by which the roll is turned. The coupling box is designed to drive the mill, to take tremendous stresses when the rolls are reversed, and further to act as a safeguard and break at a lower stress than the roll spindle. This nice point of design in a coupling-box is difficult to attain. It must be strong enough and yet not too strong.

Answering the Query—Why?

A certain steel mill had difficulty with its coupling-boxes. At times the casting would last several weeks, but more often a few days constituted the life of this part. The job of making some of these coupling-boxes was offered the foundry which welcomed trouble. The search for the difficulty was started with a casting which had failed, and one of them was obtained at once by the Indianapolis foundry for inspection and test. No glaring structural defects which would indicate faulty molding or casting were apparent. The break was more in the nature of a tear where the torsion of the spindle was resisted by the metal section of the coupling-box. This offered a clue.

A test section was cut out from the broken part. This was submitted for analysis, physical test and micro-inspection. The analysis showed carbon, 0.39 per cent; silicon, 0.22 per cent; manganese, 0.63 per cent; phosphorus, 0.021 per cent; and sulphur, 0.045 per cent. It was thought that the carbon was too high, and probably for this reason the casting was not sufficiently ductile under changing stresses. This theory was upheld by the physical tests which are presented in Table I accompanying. It will be noted, although the elastic limit is 47,850 pounds per square inch and the ultimate strain is 76,300 pounds per square inch, that the elongation is only 7.0 and the reduction of area only 6.8 per cent. The micrograph which is reproduced in Fig. 2 shows a coarse grained structure which to the management of the foundry indicated a faulty anneal. The knowledge contributed through this thorough analysis gave a starting point and definite objective. It was decided that a lower carbon steel was desirable for ductility and that a thorough annealing would give a better structure. The new coupling-boxes were molded and a metal of the following analysis was used in pouring them: Carbon, 0.22 per cent; silicon, 0.245 per cent; manganese, 0.640 per cent; phosphorus, 0.034 per cent; and sulphur,

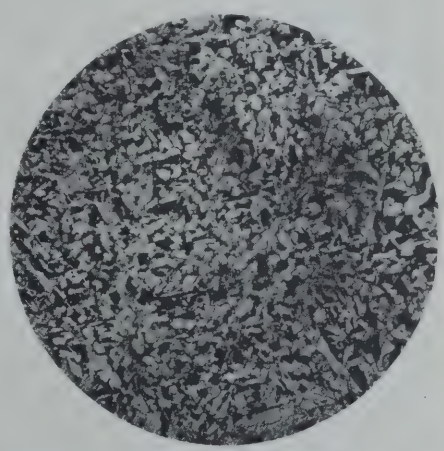

FIG. 3—MICROGRAPH OF SPECIMEN FROM THE NEW COUPLING-BOX METAL — TEST PIECE WAS ANNEALED WITH THE CASTINGS AND GIVEN THE SAME ETCHING AND MAGNIFICATION

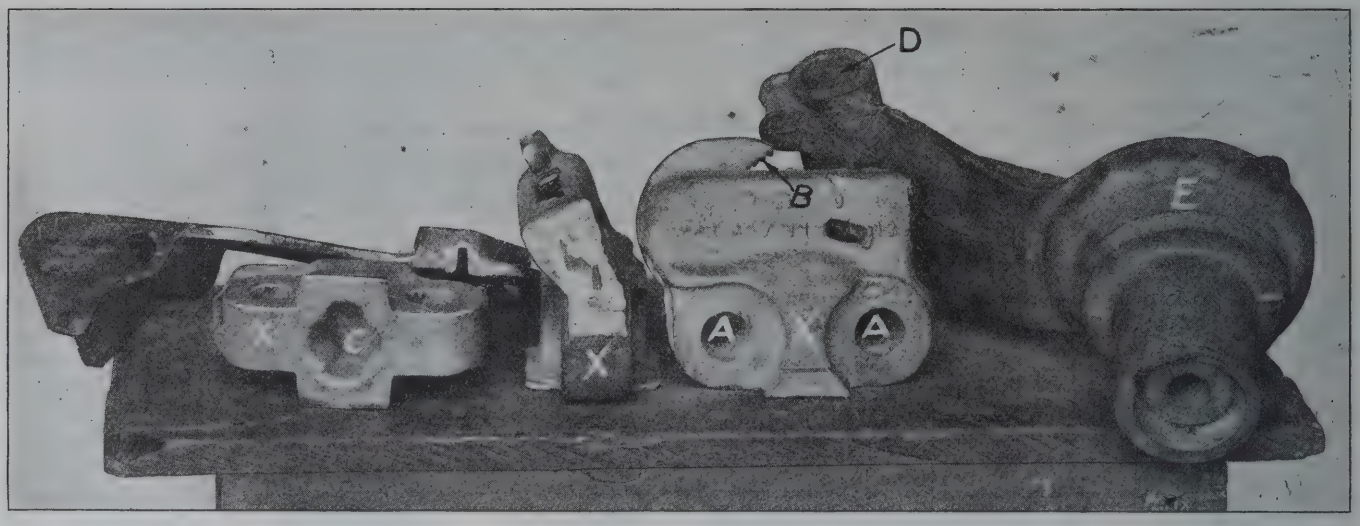

FIG. 4—TYPICAL SMALL CASTINGS MADE IN THIS FOUNDRY FROM ELECTRIC FURNACE STEEL

0.032 per cent. The physical properties demonstrated by an annealed test section similar in size to that used to represent the broken casting showed both elastic limit and ultimate strength slightly lower than before. The material in the new castings developed 38,100 and 73,100 pounds per square inch for the elastic limit and ultimate strength respectively. However, the percentage of elongation shown in the new metal was 21.0 and the reduction in area was 30.9 per cent. Ductility and resilience under repeated and reversing stress were attained, and without the sacrifice of a yield point which would permit the coupling box to fracture before the spindle failed. The micrograph, Fig. 3, shows the grain structure of the new castings. These coupling boxes have been in service continuously for about five months, and have vindicated the policy of "troubling trouble before trouble troubles you."

The diversity of the work handled by the Electric Steel Co. of Indiana presents many interesting points in molding, casting and finishing castings. Each job which enters the shop forms the basis for thorough investigation before actual production is started. Experimental castings are made, tested, sawed apart and thoroughly studied. The service to which each part is destined directs the course of the investigation

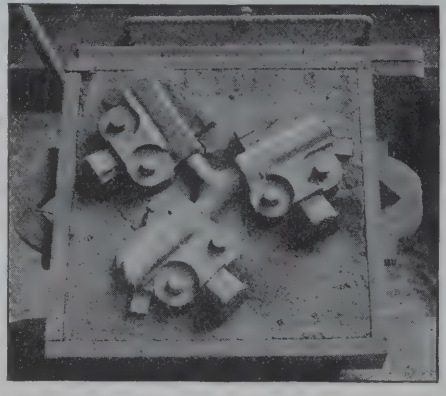

FIG. 5—SAND MATCH AND PATTERNS FOR COAL CUTTER CASTINGS

and every care is exercised to build up the physical properties desired.

Diagnosis is the first step toward performing a cure of any ill. The Electric Steel Co. has devised a simple but comprehensive system for performing a general diagnosis of its casting ailments. The accompanying Table II shows the system that is used. This chart contains a list of the various causes that produce failures in the castings. Opposite these are spaces representing each day of the month and a column for the total and percentage of defectives due to each cause. As may be noted, this gives an immediate check upon the most general ailments and steps then may be taken to rectify molding and casting errors.

A number of representative castings are shown in Fig. 4. Complicated form and section characterize the crooked little casting shown in the three views *X*. A quantity of these castings are made on intermittent orders furnished by a large manufacturer of mining and conveying machinery. The casting shown is a holder for a tool used in cutting through a bed of coal. A cutting tool is wedged into the notched jaw shown at *B*. The tool holder casting then is linked into an endless chain with a number of other similar cutters, and as the cutting machine is moved forward, the successive cutters drag across the coal surface and cut a groove with an action similar to the teeth in a

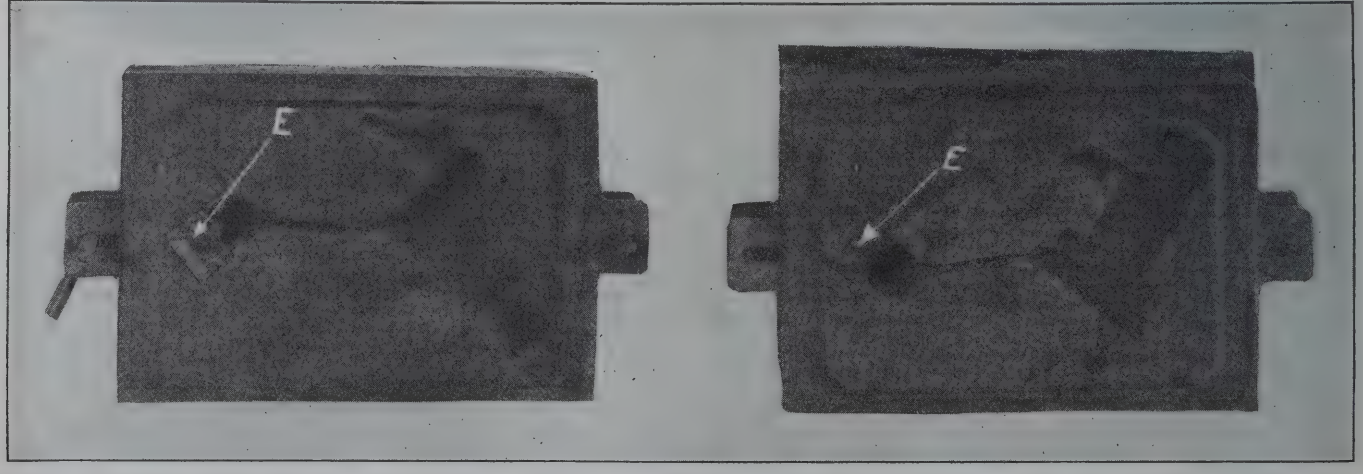

FIG. 6—MOLD FOR A TIRE-HOLDER CASTING MADE FROM MATCH PLATES

FIG. 7—ANNEALING OVEN WHERE SMALL AND MEDIUM CASTINGS ARE TREATED

band saw. The cutter castings are made from seven different patterns, similar except for the angle between the portion which holds the cutting tool and the base portion which is linked through the pin holes *A* to the endless chain. This angle may be noted in the end view of the cutter casting in Fig. 4. The seven different castings are set into the endless chain in such a manner that each succeeding cutter widens the cut until the seventh will leave an opening wide enough for the entire cutting chain to enter.

Molding rather than metallurgical problems are encountered in the manufacture of this casting. It was decided to use a sand match as comparatively few are needed at one time and repeat orders bring the job into the shop only at intervals. The inexpensive rig used is shown in Fig. 5. The patterns are set in a sand match with a set gate. The drag is rammed in a snap flask, rolled over and the match is drawn leaving the patterns in place in the drag. The cope flask then is set, rammed and removed, the patterns are drawn from the drag and the cores are set. Five small cores are used. One which carries a chill forms the recess in the base at *C;* a single long core forms the opening in which the cutting tool afterward is set; two round cores form the holes for the connecting-link pins and a single small core makes the hole in the side of the casting as shown in *D*. The prints for all these cores are shown on the patterns in Fig. 5.

Another interesting casting which forms a continuous job for this foundry is that shown at *E*, Fig. 4. This is a mounting to carry a spare wheel and tire for a passenger car built in Indianapolis. The part formerly was made from malleable iron, but last year steel was chosen for this part and an extra strengthening web was added to give additional rigidity. This job is molded from two match plates. The completed cope and drag are shown in Fig. 6. It will be noted that in addition to using flask pins for locating the two halves of the mold, male and female guides are provided on the match plates. The prints of these may be seen in the molds. The hub is cored out, as is also the bolt hole shown at *D*, Fig. 4. Two small bosses at the back of this part are formed by the small cores set in the mold as shown at *E*, Fig. 6. The mold is gated midway in the angle formed by the casting and runners are carried to the two extremities. A single riser is used at the lower extremity of the casting. The difficulty incident to this job was mainly due to the two thin-web sections set at right angles to each other, and joined to a heavier portion at the two ends. The method of

gating and pouring chosen has resulted in clean sound castings.

Proper pouring and correct gating are phases of the foundry problem which receive much attention at this plant. Occasions are mentioned where a new job has been gated in several different ways and the resultant castings have been sawed in different sections to hunt for hidden defects. Slag inclusions are guarded against at every point in the operations. The large *teapot* type ladle shown in Fig. 9 is used to receive the metal from the electric furnace. In this ladle, the metal enters at the bottom of the portion which corresponds to the teapot spout, and rising to the edge, flows over the lip. This prevents slag from overflowing from the molten surface, and gives the advantages of bottom pouring without the pressure and washing effect which is sometimes experienced with the bottom-pour ladle. The medium and light castings are poured from bull ladles and shanks filled from the crane ladle.

Steel for all classes of castings made by this company is furnished from a 3-ton acid lined Heroult furnace. Current from the Indianapolis city power mains is delivered 4300 volts and stepped down to 90 to 110 volts for use in the plant. Five heats are made every 24 hours. Three 14-inch carbon electrodes are

FIG. 9—TEAPOT LADLE USED TO RECEIVE STEEL FROM THE ELECTRIC FURNACE—THE METAL RISES THROUGH AN OPENING AT THE BOTTOM OF THE SPOUT

used. These are operated and controlled by an automatic device manufactured by the General Electric Co., Schenectady, N. Y.

A unique condition governs the direction of this furnace and its operation. The melter is in all cases subject to the guidance of the metallurgist who presides over a small but complete chemical laboratory located within a few steps from the furnace. In many foundries the melter and chemist co-operate but the melter runs the furnace, and consults the chemist only for information on the progress of the heat, and the compositions obtaining. In this plant, however, the metallurgist is skipper and the melter is first mate.

When a casting emerges from the sand in this shop its progress is only partially complete. Near the shake-out floor is a track which leads directly into sand-blast room. This sand-blast installation, which was built by the Pangborn Corp., Hagerstown, Md., permits the debris removed from the castings, together with the used abrasive to drop through a grated floor. It then passes through a separator which delivers the clean sand to a storage bin for reuse. All castings are thoroughly sand-blasted as they rest upon a small car on the narrow-gage track within the sand-blast room. They then are shoved out onto a turntable at the back through another set of doors. From this point, the casting car is shunted on into the grinding and shipping room adjacent, or else is rolled upon another track which runs to the annealing oven located parallel with the sand-blast equipment on

the same side of the molding floor. The annealing furnace is 5½ x 10½ feet inside, and 4½ feet high. It is oil-fired through three burners, two located near the bottom of the firing chamber at one side and the third on the opposite side near the roof. Pyrometric control is attained through three thermocouples, one midway of the side having the two burners with the other two, spaced equally on either side of the third burner, which is located on the opposite wall.

The pyrometers were made by Leeds & Northrup, Philadelphia. The sand sealing arrangement may be noted from Fig. 7. As the fire-brick paved car is shoved into the furnace, the overhanging sides of the car slide into the sand in the two troughs, one of which is at the left of the door. This seals the furnace at the bottom, and the door drops upon the extending end of the car platform and forms practically an air-tight closure at the front of the oven.

Great care is exercised in annealing. A study of the intended uses of the castings is used as a basis, and the method of anneal is varied to suit the requirements. Small castings are annealed up to 1650 to 1675 degrees Fahr. The temperature is raised gradually and held for from 3½ to 5 hours for a 0.30 per cent carbon steel. The castings then are cooled in the furnace, removed and cooled in air, or quenched in a tank of water directly at the side of the runout track from the furnace, as may be desired. The quenching tank is merely a boiler shell buried to its rim and protected by a wooden cover when not in use. The temperatures obtained in all parts of the furnace chamber are practically the same. The variation between the three thermocouples is seldom found to be over 10 to 15 degrees.

Shop is Well Equipped

The shop is liberally equipped with molding machines, swing and stand grinders, sand mullers and handling equipment. The medium sized flasks are handled from molding machines by air-operated jib cranes, and the main bay is served by two electric overhead girder cranes each rated at five tons.

Sand is carried from the shakeout floor to a corner of the shop where an overhead bin feeds down into a Simpson grinding pan, manufactured by the National Engineering Co., Chicago. Outside sand storage is adjacent to this point, and the new material is wheeled to the mixer. Core sand is mixed on the opposite side of the shop near the core department. Three large core ovens provide ample facilities for the great number of small cores needed in this plant. These are all coke fired.

Chinese Industry Has Prosperous Year

During 1918 the Hanyang Iron & Steel Works, China, according to *Commerce Reports*, produced 118,932 tons of basic iron; 31,655 tons of foundry iron; 20,093 tons of rail steel and 40,839 tons of mild steel. This company controls the most important single industry in China and by a process of amalgamation, large coal and iron mines, near which it is located, have come under its control. The consolidation of the steel plant and mines is known as the Han-Yeh-Ping Iron & Coal Co., Ltd. The output of coal and iron ore from the mines of the company exceeded all expectations, the iron ore production being 541,699 tons and the coal output 288,688 tons. Besides this the mines produced 67,368 tons of white limestone, 10,178 tons of blue limestone and 14,620 tons of dolomite. The production of coke amounted to 252,326 tons. Little improvements have been added to the plant since 1917, when a modern ore unloading plant was constructed. In October of last year, pig iron rose 50 per cent. An increase of 100 per cent for plates and 80 per cent for shapes was experienced in September. These prices were maintained until the end of the year.

Another Chinese interest which has done considerable work during the past year is the Yangtze Engineering Works, Ltd., which built gunboats for the Chinese government, railroad bridges and various industrial construction. According to a report of the company's directors for the year just passed, the principal work engaged in by the works was railway work, such as bridges, passenger cars, etc. A fair amount of structural work for blast furnaces and repairs to machinery, boilers, etc., also was executed. According to the comment of *Commerce Reports* the plant of this company is modern, is running under good management, and can easily be adapted to the construction of concrete vessels. Its location for shipbuilding is such that vessels can reach the sea from the company's docks during eight months of the year.

Germany Lacks Coal

Owing to the interruption in the output of coal from the German collieries, the production of soda ash is so much restricted that all industries dependent on that product are seriously hindered. A demand for 6000 tons is met by an output of only 800 tons. The textile, leather, metal, soap, dyestuffs and aluminum industries, as well as some others of less importance, are suffering from the shortage. The nitrate industry, too, is suffering in common with the rest from lack of coal. Some of these works have been brought to a standstill. Production is now only half of what is needed to meet the demand in peace time. The consequences are becoming disastrous to agriculture. (*Zeitschrift für angewandte Chemie.*)

FIG. 10—METHOD OF HOLDING ROLLING MILL SPINDLE FOR GRINDING THE END AFTER REMOVING THE GATE

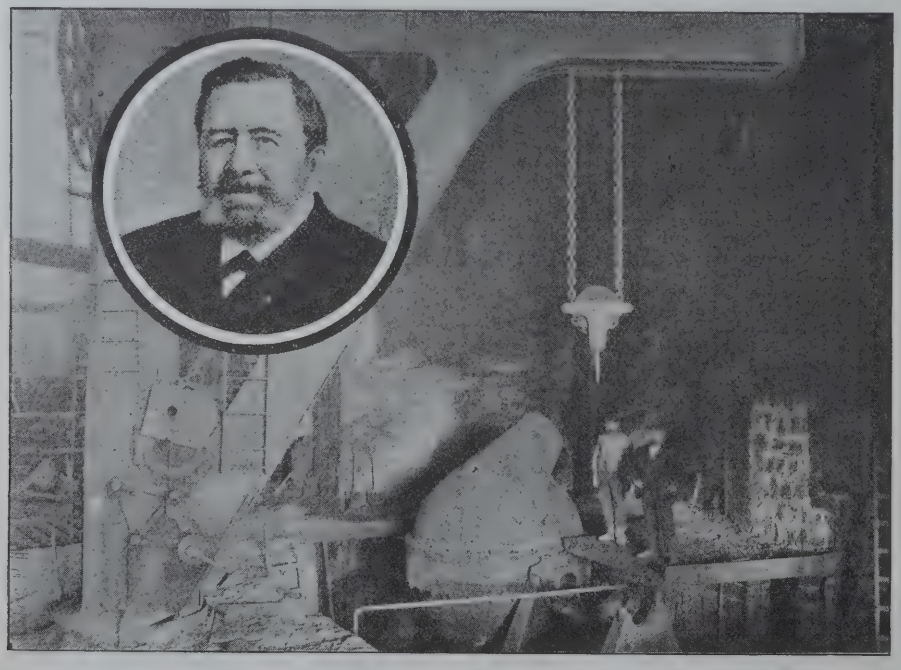
Book Review

Iron and Steel, by Erik Oberg and Franklin D. Jones; cloth, 328 pages, 6¼ x 9¼ inches; published by The Industrial Press, New York; furnished by THE IRON TRADE REVIEW for $2.50 net.

For the student in technical schools and for those engaged in machine building and mechanical engineering fields, *Iron and Steel* is a valuable text book. It gives a broad general survey of the smelting, refining and mechanical processes in the manufacture of iron and steel, including the chemical and physical characteristics of wrought iron, various grades of steel, and iron and steel castings. The authors have endeavored to furnish the student with complete information pertaining to the commercial forms and grades of iron and steel products and the particular class of service to which these are applicable.

Beginning with a short general classification of iron and steel, manufacturing processes from the smelting of the ore to the production of the finished product are described. Terms commonly used in the iron and steel industry are defined.

More than a hundred pages are devoted to the classification of steel and to the details of the bessemer, open-hearth, crucible and electric processes of manufacture. There is also a chapter on the rolling mill industry in which the manufacture of bars, rails, plates, shafting, wire, etc., is described. The concluding chapters are devoted to iron and steel castings. The book is well illustrated and contains a complete alphabetical index for the convenience of the reader.



Recovery of Manganese Ore From Slag

A German patent describes means for recovering manganese from low-percentage manganese carrying blast furnace slag. In an electrical furnace a sump bath of iron, or clippings and turnings, is melted without access of air, and into this the blast furnace slag of basic proportion of 1 to 0.8 is put, and the bath raised to the highest temperature possible. When fusion has taken place, as much lime is added as the fluidity of the bath will permit. A better reduction of the manganese is thereby effected, due to the increased basic qualities of the slag. The sulphur and manganese compound of the blast furnace slag is broken up, and the sulphur carried over to the final slag. To the whole molten bath a reducing agent is then added in the form of small pieces of coke, whereupon the reduction of the manganese and oxygen compounds takes place according to the equation $MnO + C = Mn + CO$. The reduction is greatly facilitated by the use of lime and coke, prepared in the electric furnace, where, under the action of the electric arc, calcium carbide is formed, which substance serves as the carrier of the carbon required. The molten iron takes up the reduced manganese, forming a ferroalloy.

During 1918 the production of domestic ores containing not less than 10 per cent manganese, was 1,150,000 tons, according to figures compiled by the United States geological survey.

Revive Bessemer Practice in Early Days

THE memory of G. F. Goransson, founder of the Sandvik Steel Works, Sandviken, Sweden, has been perpetuated by a statue unveiled at that city on July 18. On account of the indefatigable energy which he displayed in furthering its progress, the name of Mr. Goransson, who was born in Sweden 100 years ago, occupies a leading place in the annals of the Swedish iron and steel industry. He is recognized throughout the steel-producing world for his achievement in putting Sir Henry Bessemer's theory into practical use. The bessemer theory of steel production, which was at first confined almost exclusively to laboratory experiments, had, up to the year 1856, been crowned with so little success, from a practical point of view, that it was abandoned in England as a commercial venture. Despite this development, Mr. Goransson visited that country in 1857 and purchased the patent rights for Sweden. With the assistance of two engineers, C. Lundvik and C. P. Lindberg, in November of the same year, at Edsken, Sweden, he made new attempts toward the materialization of Mr. Bessemer's theory. After many trials and failures, Mr. Goransson, on July 18, 1858, succeeded in producing bessemer steel on a commercial basis. By reason of the successful result of the attempts at Edsken, confidence in the bessemer process was revived. In order to develop this method on a larger scale, Mr. Goransson, with others, established the Sandvik Steel Works, at Sandviken, Sweden, in 1862 and 1863, and here the first movable bessemer converter, shown in the accompanying illustration, was erected. The Sandvik Steel Works today is one of the largest establishments of its kind in Sweden and is sending its products to nearly all parts of the world.

EARLY MOVABLE BESSEMER CONVERTER BUILT BY G. F. GORANSSON AT SANDVIKEN, SWEDEN. MR. GORANSSON IS SHOWN IN THE INSERT

Iron and Steel Electrical Engineers Will Meet

The Association of Iron & Steel Electrical Engineers will hold its thirteenth annual convention at St. Louis, Sept. 22 to 26. Headquarters of the convention will be Hotel Statler. The following program is announced:

Monday, Sept. 22

9:00 A. M.—Registration.
10:00 A. M.—Business session.
2:00 P. M.—Professional session.
"Educational Committee Report," Chairman, A. B. Holcomb.
"Safety Rules for Government of Employes Working on Electrical Equipment," by Safety Committee, chairman, Walter Greenwood.

Tuesday, Sept. 23

9:00 A. M.—Professional session.
"Organization of the Electrical Department in the Iron and Steel Industry." (Joint paper.)
"Inspection and Operation of Electrical Apparatus," J. A. Morgan and J. J. Booth.
"Educational Training for Electrical Employes," B. A. Cornwell.
"Electrical Repair Shop," C. A. Menk.
"Storeroom and Spares," T. E. Tynes.
"Records and Tests," R. B. Gerhardt.
2:00 P. M.—Excursion.

Wednesday, Sept. 24

9:00 A. M.—Professional session.
"A. C. vs. D. C. Motors for Rolling Mill Table Drives," W. S. Hall.
"Recent Improvements in Industrial Control," H. D. James.
2:00 P. M.—Professional session.
"Present Status of Electric Furnaces in the Steel Industry." by electric furnace committee, chairman, R. D. Nye.
"Electric Heat Treatment," C. A. Winder.
7:00 P. M.—Annual banquet.

Thursday, Sept. 25

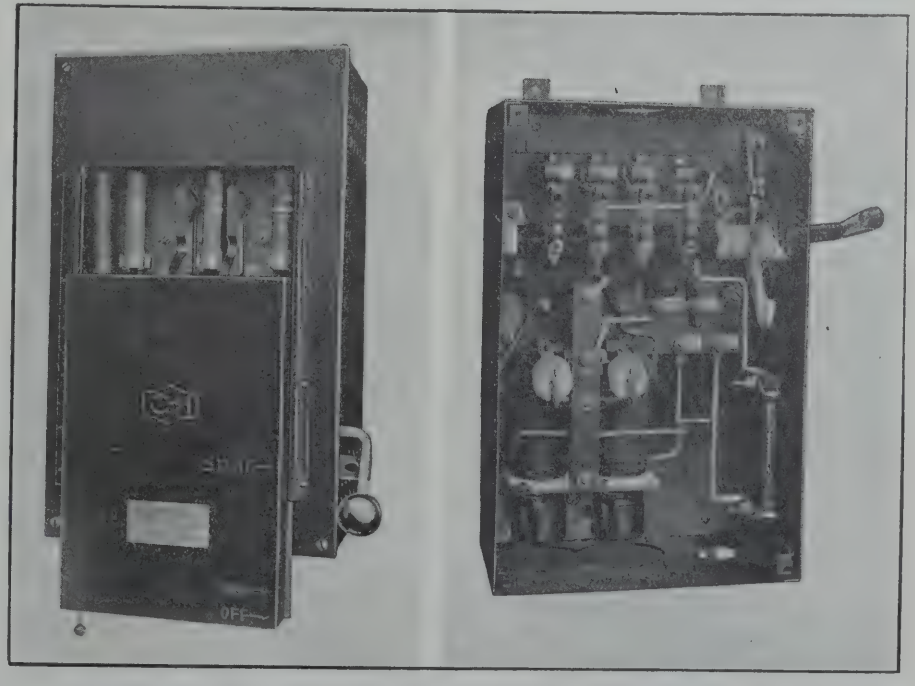
9:00 A. M.—Papers.
"Influence of Gear Ratio on Speed of Operation, Motor Heating and Contactor Wear in Auxiliary Steel Mill Drives," J. E. Fries.
"Overload Protection for Motors," Paul M. Lincoln.
2:00 P. M.—Papers.
"Overload Protection on Cranes," A. G. Place.
"General Specification for A. C. Motors for Main Roll Drive," by Standardization committee, chairman, T. E. Tynes.

Friday, Sept. 26

9:00 A. M.—Papers.
"Present Status of Arc-Welding in the Iron and Steel Industry." (Joint paper.)
Wilson Welder & Metals Co., A. Churchward.
General Electric Co., H. L. Unland.
C. & C. Electric & Mfg. Co., A. M. Bennett.
Lincoln Electric Co., R. A. Kinkead.
Electric Arc-Cutting & Welding Co., C. J. Holslag.
The Arcwell Corp., R. M. Rush.
Westinghouse Electric & Mfg. Co., A. M. Candy.
2:00 P. M.—Excursion.

Motor Starters Have Protective Devices

Two new enclosed motor starters, designed to insure safety in operation and protection from abuse have been designed by the Cutler-Hammer Mfg. Co., Milwaukee. This apparatus, it is claimed, may be located in exposed places and successfully operated by unskilled labor without any danger to the operator or the apparatus.



All live parts of the switches are completely enclosed but may be easily inspected by lowering a sliding panel, which automatically opens the switch and prevents the starter from being used until the cover is replaced. Since danger from live parts is eliminated, an unskilled person can operate either type with safety by giving the lever, which projects from the enclosed case, a short radial movement. To prevent unauthorized operation, the switch handles may be locked. Contact points and fingers are of standard drum construction, easily inspected and renewed and kept clean by their vertical position which prevents the accumulation of dirt and grease. The switch cases are arranged for conduit wiring.

The starter, shown on the left of the accompanying illustration, is a fused starter and is especially adapted for motors which cannot be connected directly to the line when starting. A resistor enclosed in the same casing with the switch decreases the initial voltage to 60 or 75 per cent as desired and maintains the balance of all three phases while starting. The fuses are out of the motor circuit until the rotor has reached normal speed, thus they do not carry the heavy starting current and need be of no greater capacity than proper protection requires. The switch is released by pulling the drop cord. This starter contains a low-voltage release coil. A duplex overload relay and a low-voltage release coil, both enclosed with the switch, are provided with the starter shown in the right of the illustration. The overload unit has an inverse time element which permits a large initial starting current or a temporary overload but protects the motor from a continuous heavy overload. This switch is made with either three or four poles. Both starters are made in several sizes for operating squirrel cage motors on potential not exceeding 550 volts.

Machinery Sellers Meet

Formed some time ago by several machine tool dealers, the Machinery Sales association will hold its fifth meeting at the New Gibson hotel, Cincinnati, Sept. 20 and 21, under the auspices of the Cincinnati associate, the Seifreat-Woodruff Co. A banquet and a ladies' entertainment program will feature this convention. Soon after, it is expected that full details of the operation of the association will be published.

Members who are expected to attend are the W. J. Baird Machinery Co., Detroit; the Cleveland-Duplex Machinery Co., Cleveland; Empire Machinery & Supply Co., Buffalo; Eastern Machinery & Equipment Co., Philadelphia; McCoy-Brandt Machinery Co., Pittsburgh; Stocker-Rumely-Wachs Co., Chicago, and the Seifreat-Woodruff Co., Dayton and Cincinnati.

TWO NEW MOTOR STARTERS. THE ONE ON THE LEFT HAS A RESISTOR FOR REDUCING THE VOLTAGE WHILE THE ONE ON THE RIGHT HAS AN INVERSE TIME ELEMENT FOR LARGE CURRENTS

July Exports Cut Almost in Half

Outgoing Shipments Reach the Lowest Figure Since May, 1915 and Total 287,685 Tons—Imports Make a Gain of 34.2 Per Cent—Exchange and Dockmen's Strike Assigned as Cause

IRON and steel exports, after gaining rapidly for four consecutive months, took a sharp drop in July and reached the lowest figure since May, 1915. Imports on the other hand, continued on the increase and registered the largest gain since March of the year. To the foreign exchange situation may be ascribed the greatest cause for these changes in foreign business with the harbor strike in New York as a contributory factor on the export side.

July exports totaled 287,685 tons compared with 561,020 tons in June, a difference of 273,335 tons or of 48.7 per cent. By this precipitate drop the July figure is reduced to the lowest point in over four years or since May, 1915, when the total was 262,306 tons. Compared to the high record of exports in December, 1917, of 653,344 tons, the July tonnage represents only 44 per cent. Although a few products showed slight gains in tonnage over the previous month, the majority showed losses, some of large proportions. Pig iron with a total of 39,758 tons in June increased to 42,327 tons in July while steel billets, ingots and blooms fell from 46,016 tons to 21,318 tons.

Imports for July gained 34.2 per cent compared to a gain of 17.7 per cent in June. The total was 28,258 tons and the largest since July, 1917, when 28,859 tons of iron and steel were imported. The June total was 21,056 tons or 7202 tons less than the July total. The greater part of the gain was made by the importation of scrap which gained from 10,830 tons to 20,393 tons.

The largest losses in finished steel exports were in wire rods, steel rails, steel bars, structural iron and steel, hoops and bands, sheets and plates, tin and terne plate, wire, and pipes and fittings. A gain was shown in scrap iron.

Iron ore imports for July decreased from 30,605 tons to 23,347 tons, shipments from all countries being lower.

Plenty of Coal, No Advance if-

Operators Tell Senators Supplies at Fair Price Will Be Plentiful, Barring Strikes, Car Shortage and Severe Weather—Hines Declares Pretext Will be Found to Raise Price, and Urges Extension of Government Control

WASHINGTON, Sept. 9.—Because of the vital need in the iron and steel industry and in affiliated lines of production of obtaining adequate supplies of coal at fair prices, testimony given last week before the subcommittee of the senate committee on interstate commerce is important. While conflicting views were expressed by witnesses, all agreed that barring labor troubles and unusually severe weather, sufficient coal will be available, despite the present shortage of production. Under favorable conditions there is no reason, according to coal operators, why prices should be increased further, although all expressed uncertainty as to conditions in the near future.

Director General Hines urged that operation of the Lever act to control prices be resumed, a recommendation strongly opposed by Frank S. Peabody, of Chicago, a prominent coal operator.

Regarding the car supply situation, interesting figures as to the number of cars built by the railroad administration, the number delivered, the number being stenciled preparatory to being placed in service, and the number under contract, were presented by Frank K. McManamy, assistant to the director of operations, in charge of mechanical matters.

Hines' Charge Denied By Coal Operators

DIRECTOR GENERAL HINES told the subcommittee that wartime powers placing coal under government control should be extended. He made this recommendation on the ground that coal operators might be expected to exploit and exaggerate transportation difficulties this winter in order to increase prices.

Mr. Hines urged that an appropriation be made to enable the geological survey to get accurate data on coal produced, the amount required and the probability of requirements being met. Chairman Frelinghuysen said he would try to obtain the appropriation. Mr. Hines also asked that the committee ascertain the cost of coal at the mines and prices at which it is sold to retail dealers. He expressed the opinion that the railroad administration will be able to furnish adequate transportation facilities to supply coal this winter.

Frank S. Peabody, of Chicago, a coal mine operator, formerly chairman of the committee on coal production of the council of national defense, declared operators are not waiting for a pretext to raise prices. He said coal operators in Franklin county, Ill., could sell their coal today at $1 a ton above what they are selling it for, but are not going to ask for the additional dollar.

"We are not going to claim that it is for any humane reason, or not wanting the money, because we do want it," said Mr. Peabody. "But we are afraid of the nationalization of coal mines. We are afraid if the public begins to clamor against prices the senators and representatives here will try and pass some drastic laws that will take our properties away from us. That is why we are not getting the price we could get today."

Mr. Peabody denied that unduly high prices are being charged for coal, and said legislation intended to alter the laws of supply and demand will not remedy the coal problem. He thought coal men of the country would be glad to have congress pass a law allowing them 6 or 10 per cent gross profit.

Concerning the supply of coal, Mr. Peabody said he did not think there is a probability of a coal shortage this winter unless deliveries are held up by car shortage or labor troubles.

Mr. Hines said that undoubtedly there is going to be a continuation of transportation difficulties. It was his judgment, however, that the railroad administration will overcome them to the extent of transporting the coal which the country needs. The railroad administration, Mr. Hines said, is trying to avoid waste of cars. The peak of cars loaded with coal for the railroads was reached on June 6, when the number was 51,770. The number has been dropping ever since, being 33,790 on Aug. 22. The railroads have 12,500,000 tons of coal in stock, practically all of it on the ground or in the chutes.

Discussing the general coal situation, Mr. Peabody said:

"The possibility of strikes is the most dangerous thing we have in the future, a card shortage already exists, severe weather conditions may or may not come. With strikes, car shortage and bad weather there is nothing, in my opinion, that can save the United States from a very serious coal famine."

The physical capacity of the mines, he said, is sufficient to produce 40 per cent more coal than the possible demands of the United States. Because of this, the coal problem comes back to the question of car supply. By placing the Lever bill in operation again, he said, it will automatically put up the costs to the railroads from 20 to 50 cents a ton, because the railroads bought their coal from 20 to 50 cents per ton lower than the government prices.

Official Explains Car-Supply Situation

FRANK K. McMANAMY, assistant director of operations in charge of mechanical matters, United States railroad administration, pointed out that in July, 1918, there was a total of 62,270 locomotives on lines in federal operation, 14.9 per cent of which were out of service for repairs, with 798 locomotives stored in serviceable condition on account of not being needed. In January, 1919, there were 63,969 loco-

motives with 16.9 per cent out of service for repairs and 1582 stored serviceable. In April, 1919, there were 64,499 locomotives with 18.4 per cent out of service for repairs and 4604 stored serviceable. In July there were 64,828 locomotives in service with 17.9 per cent out of service for repairs and 3668 stored serviceable. Mr. McManamy said:

"The number of locomotives held out of service for repairs closely follows the number stored serviceable, and as the number of stored serviceable increases the number held out of service for repairs shows a similar increase. This indicates that the number of locomotives held out of service for repairs does not always correctly represent the actual condition of motive power. In this case it simply indicates that due to the fact that there is a surplus of locomotives in good condition locomotives are held for repairs which would be continued in service if needed.

"The general condition of locomotives is better today than it has been at any time during the period of federal operation or during the three-year test period preceding. So far as locomotives are concerned there is no ground for apprehension, as there will be sufficient power to handle all business offered to the maximum capacity of terminal facilities."

With respect to freight cars, Mr. McManamy said the situation is different. On July 1, 1918, 167,403, or 7.1 per cent of the freight cars were in bad condition. A vigorous campaign to reduce the number of freight cars had been under way for some months. The force of shop men was at its maximum at that time and was being worked approximately 70 hours per week. As a result of this, said Mr. McManamy, the percentage of bad order freight cars gradually decreased to 130,506, or 5.4 per cent in December, 1918.

Immediately following the signing of the armistice the hours of the employes in the car department, who for many months had been working 10 hours or more per day, seven days a week, were reduced to nine hours per day, six days a week, and on Dec. 9 they were further reduced to eight hours per day, or 48 hours per week. The decrease in business was sufficient to keep down the percentage of bad order cars.

Views Vary Widely on Shortage of Labor

ACCORDING to testimony given by C. E. Lesher, statistical expert of the geological survey, shortage of labor in coal mines is only of a local character. While he conceded there was an unusually heavy emigration of laborers he did not think it was of sufficient proportions to cause alarm. Mr. Lesher pointed out that oil is displacing coal to some extent, and expressed the view that there will be enough labor this fall and winter to produce the necessary supply of coal.

Contrasting views were expressed previously by J. D. A. Morrow, vice president of the National Coal association. He submitted letters from the Pittsburgh district showing heavy shortages of labor in coal mines. One showed that the Carnegie Steel Co. is short about 500 men below the capacity of the mines to employ men. The Pittsburgh Coal Co., it was stated, was short 6714 men in July, 1919. The Hillman Coal & Coke Co. was reported to be of the opinion that it and its subsidiaries are short of miners to the extent of 20 to 50 per cent, varying in conditions in the individual mines. The Verner Coal & Coke Co. reported a shortage of 500 men, or 28 per cent, while the Henderson Coal Co. reported a shortage of 35 per cent.

Mr. Morrow coupled this situation with the shortage of cars, resulting in decreased production of coal. Giving figures of immigrants and emigrants, Mr. Morrow showed that for the five years, 1910 to 1914, the average number of immigrants that came into the United States was 1,034,920. The average movement out was 288,578, so that the net increase from immigration alone was 746,362 each year. In the five fiscal years since 1914 it was stated, the number coming in had been 278,899, and the average going out was 191,292, or a net gain of 87,606, on an average, for those five years.

"It is significant that for the year 1919," said Mr. Morrow, "the number going out has exceeded the number coming in by 98,818. The bituminous coal mining industry recruits a large number from the steel industry, a supply which has been cut off materially for a number of years. The fields most affected are the eastern districts, West Virginia, Pennsylvania, eastern Ohio, and, to some extent, some of the other districts, but those primarily, are the ones to which this information applies particularly."

Mr. Morrow said that increases in price of coal are due to natural conditions. Referring to the fact that at the end of May coal in the Pittsburgh district was selling at $2.32 a ton, while at the end of 21 days of August it had advanced to $2.47, Mr. Morrow said one reason for the higher prices is the increased industrial activity in the Pittsburgh district. He quoted production figures of pig iron to show the expanded operations in the iron and steel industry. Steel companies, he said, when not taking the full deliveries on their contracts for coal, are allowing the mines to ship some of that tonnage in other directions, and in a certain month or week there is more free coal on the market, creating a depressing factor on price.

He submitted a report from Pittsburgh district coal operators showing that the average cost of production per ton in 1918 was $2.06 while the average price that was realized, including shipments on contract and all other items, was $2.48. This showed an average in cents per ton of 42 and an average per cent on the capital invested of 6.5 for that year. Further analysis by months showed that for the six months ending June 30, 1919, average cost per ton was $2.05, while the average price realized was $2.24, an average of 2.9 per cent on the capital invested.

John Callahan, traffic manager of the coal association, presented numerous telegrams showing a car shortage in practically every bituminous coal district. Renewing charges against the railroad administration, Mr. Callahan said hundreds of cars filled with slag from blast furnaces and steel mills and other socalled waste material were permitted to stand on sidings for weeks at a time.

Settle Iron Roads' Case

WASHINGTON, Sept. 9.—Several iron ore mines, blast furnaces and steel plants and two railroads in eastern Pennsylvania and western New Jersey are involved in a complicated industrial railroad rate case tentatively disposed of Sept. 5. Chief Examiner

Thurtell, of the interstate commerce commission, filed recommendations as to how the commission should decide issues raised in complaints of the Empire Steel & Iron Co., against the Central Railroad, of New Jersey, and others, and the Thomas Iron Co., agains tthe Central Railroad, of New Jersey and others.

The Mount Hope Mineral railroad and the Ironton railroad companies are the ones directly involved. The first mentioned serves the complainants by hauling iron ore to their blast furnaces in connection with the trunk lines serving Wharton, N. J. The Ironton railroad, owned by the Thomas Iron Co., serves that company and many other shippers in and around Hokendauqua, Pa. It is an industrial railroad for which the proprietary interest furnishes only 15 per cent of the traffic.

In the case of the Mineral railroad, request was made for Wharton and New York district rates, the first on short haul traffic and the latter on long haul traffic. In the case of the Ironton railroad the request was that the Hokendauqua rates be applied to tracks of the Ironton line, formerly owned by the Thomas Railroad Co., on which cars must be spotted before true delivery can be made to the Thomas Iron Co. These requests were of an alternative character. They provided that either the trunk lines give the rates and service or make allowances for the performance of terminal services by the Ironton line or road-haul service by the Mineral railroad.

It was recommended by the chief examiner that both roads be held to be common carriers. It was also held that the application of rates to and from Mineral railroad stations equal to the combination on Wharton, N. J., had not been shown to be unreasonable. He also recommended that the request for joint rates be denied.

The Mineral railroad is owned by the Empire and Thomas companies. The railroad owns two locomotives and two combination cars but no freight cars. Therefore on that phase of the combined cases, the Thomas Iron Co. will lose its contentions, if the commission approves the report made by the chief examiner.

Concerning the refusal of the trunk lines to spot cars for the Thomas company on that part of the Ironton railroad formerly constituting the property of the Thomas railroad and prior to that the industry tracks of the Thomas Iron Co., the decision recommended, if aproved, will result as follows: Either the Ironton railroad will receive allowances for the terminal service it performs in spotting cars for the Thomas company or the trunk lines will make an arrangement with the Ironton railroad for the the use of its tracks for the performance of spotting services for the Thomas Iron Co. The chief examiner recommended that the refusal of the trunk lines to maintain joint rates, including terminal and spotting costs to and from the Thomas Iron Co.'s furnace tracks at Hokendauqua, including terminal costs at competitive furnace points in eastern Pennsylvania, constituted undue prejudice. A further recommendation was that the practice of the trunk lines in assessing demurrage charges predicated upon the time of the placement on interchange tracks and application individually by the trunk lines of the average rule was unreasonable and unduly prejudicial. Mr. Thurtell also recommended the grant of reparation as to demurrage assessed and collected under such conditions.

Fabrication Case Heard

WASHINGTON, Sept. 9.—With the commencement of a hearing scheduled to begin in Philadelphia today on the question of extending the fabrication-in-transit privilege of iron and steel articles regardless of what use the materials are intended for, shipbuilders who for more than 18 months have been contending for this concession from the railroad administration believe they have all but won their fight.

J. L. Eysmans, chairman of the Philadelphia district freight traffic committee, under the eastern territory section of the division of traffic, United States railroad administration, upon instructions from the administration, formerly gave notice of the hearing late in August and will preside. The hearing is the result of an application made in February, 1918, by G. Lloyd Wilson, traffic manager of the then Chester Shipbuilding Co., Ltd., but now Chester plant of the Merchant Shipbuilding Corp. The application was held up first because of more pressing war matters and later by the failure of the railroad administration to give it the attention which the shipbuilders believed it should have.

The hearing is on proposed revision of rules covering fabrication-in-transit on iron and steel articles at fabricating points provided in current tariffs. Under the proposal carload shipments of iron and steel may be forwarded to these points for bending, bolting, boring, counter sinking, cutting, drilling, painting, planing, punching, reaming, riveting, sawing, sheathing and welding. Rolling, crimping, burning, forging and chipping are not included. The privilege processes may apply to the following articles: Angles, bars, beams, bolts, castings, channels, columns, ells, girders, masts, plates, nuts, rivets rods, tees and zees when shipped in the rough.

The privilege will be granted to only those operators including fabricators, of plants "who keep records. file reports and handle shipments in the manner prescribed" in the rules and who permit inspection of records by the freight inspection bureau having jurisdiction. Plants are not required to preserve the identity of inbound material which may be consolidated and applied against tonnage balances without regard to origin of the material. Time allowed for the privilege will be limited to six month from date of the inbound freight bill. After expiration of the time limit charges will be billed on the basis of full tariff rates.

Proposed revisions include rules for application, transit plants reached by two or more roads, nontransit tonnage, substitution, deduction, records, claims, settlement and rates, deficiency in weights, mixed shipments, shippers' certificates, etc.

The rates to be charged under the fabrication privilege is 2.5 cents per 100 pounds, which is one cent more than the rate at present in effect on steel for buildings, bridges and tunnels. While no estimate is available as to what this privilege means in savings to industries heretofore not enjoying it, it has been estimated by steel shipbuilders that in their own industry fully $50,000,000 annually will be saved. This, of course, means a loss of that amount to the railroads but, according to those advocating the extension, it will so stimulate shipbuilding and other industries by reducing their costs as to increase freight shipments and more than make up the difference to the carriers.

The regular annual meeting of the stockholders of the National Malleable Castings Co., Cleveland, has been called for Sept. 24. Election of nine directors and transaction of other business will take place.

Deny Employes Run Arsenals

Secretary of War and Chief of Ordnance Repudiate Reports That Government Has Relinquished Its Authority and Has Applied the Principles of the Plumb Plan—Men Merely Have Representation, Says Baker

WASHINGTON, Sept. 9.—Quick denial was made by officials of the war department that the government has turned over control of production activities at arsenals to workers under an arrangement which was reported to be application by the government itself of principles of the Plumb plan. Advocates of this plan seized upon the announcement that had been made regarding the experiement inaugurated at the Rock Island, Ill., arsenal by which employes and officers of the arsenals determined prices to be bid on work done, as well as the appointment of foremen by employes. These advocates said the plan was a straight-out adoption of their system.

The statement of Secretary of War Newton D. Baker said that publication of correspondence between representatives of arsenal employes and himself has led to widespread misunderstanding of the situation. The statement in part follows:

"The war department has encouraged the formation of committees of its employes in the arsenals, which committees consult freely with the men and act in an advisory capacity to the management on questions of shop conditions, production and wages.

"By this means hearty co-operation has been secured and complete sympathy between the management and the employes has resulted. The authority of the management, however, is wholly undimished by the advisory relation of the committees—the management of the plants is undisturbed—the government operates them, and the authority of the commanding officer is as complete as it has always been.

"The whole purpose of the steps which have been taken is to bring about understanding and good feeling, but not in any sense to part with either the responsibility or the authority of the government in the management of these industrial enterprises."

Share in Responsibility for Bids

The employes, through sharing in the responsibility for submitting bids for work, it is explained, do have an important part in conducting the operations of the arsenals. The arsenals can often submit figures which private plants cannot meet because the former disregard capital investment, overhead charges, insurance, and even profits. Private producers, therefore, who are essential to the country both in war and peace, are placed at a tremendous disadvantage by the arsenals through the apparent socialistic system that has been placed in operation.

It seems evident that the system has been the outgrowth of dissensions between arsenal employes and the management, such as those relating to the Taylor scientific shop management system. It is shown in correspondence passing between Secretary Baker and the employes that the latter have in the past actually curtailed production purposely.

The correspondence given out includes a letter written to the secretary of war by the arsenal employes' representatives on the arsenal orders branch of the office of chief of ordnance, memorandum submitted by the employes' representatives with the letter of the secretary, and the letter of the secretary to the employes representatives, expressing pleasure at the results obtained from the so-called spirit of co-operation between the employes and the management.

Retains Responsibility

Later Secretary Baker had a conference with Brig. Gen. C. C. Williams, chief of ordnance, who also repudiated the intimation that the government had relinquished any of its authority at Rock Island to the workers or adopted the Plumb plan ideas. General Williams sent a telegram to Col. Harry B. Jordan, commandant of the Rock Island arsenal in which he denied that the harness shop at the arsenal had been turned over to the workers or that such steps for so-called "democratization of the industry" would be followed in other plants of the government. The telegram follows:

"Referring to statement in many papers that the harness shop at Rock Island arsenal had been turned over to the workers, the secretary of war informed me personally that he had no intention of allowing interference in any way with the authority and responsibility of management in conducting affairs at the arsenals. You are authorized to give publicity to this statement."

General Williams said emphatically that not only had the government not turned over the harness shop to the workers, but that it did not propose to turn over the management of the arsenals to them.

"The policy," he said, "is that the government is responsible for the management of these arsenals, and it intends to cling to that responsibility."

It was insisted by General Williams that nothing which had been done in the experiment at Rock Island was to be regarded as being in any wise a radical move. He said he was familiar with what had been done in private industry in an effort to improve relations with workers, and that the experiment at Rock Island paralleled what had been done in certain plants of private industry.

Machinists on Strike

About 1500 machinists in Boston and vicinity are on strike for higher wages and a shorter working day. Union organizers demand that a scale of 90 cents an hour for skilled machinists and toolmakers, 75 cents for specialists and 60 cents for helpers be put in effect by Oct. 1, and threaten to call out more men unless the demand is granted. The machinists now out are making various demands, some asking for a 44-hour week with pay for 48, while others are asking for a 48-hour week with pay for 54 hours. About 12 shops are affected.

Machinists are on a strike in several other cities, including Springfield, Mass., and Akron, O. In Springfield, the National Equipment Co. informed all employes that they must sign a contract not to join a union while in the employe of the company, or resign. Approximately 550 out of 750 quit. The company asked for an injunction to restrain the machinists' local from interfering with its business.

Much of the trouble experienced with machinists now on strike is said to be due to the fact that men comparatively inexperienced in machine-shop work were given considerable help to enable them to "fill in" during the war. Unskilled laborers in many instances were taugh repetitive work after machines had been set up for them; they joined machinists' unions and now expect the same wages paid to experienced machinists.

British Plants Are Active Again

Blast Furnaces and Steel Works, Temporarily Halted by Coal Strike, Resume Production—Demand for Pig Iron, However, is Light—Bars are Advanced—Americans Undersell Welsh Tin Plate Makers

Bureau of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation St.,
Birmingham, Eng., Aug. 25.

BLAST furnaces gradually are resuming full production after the termination of the Yorkshire coal strike. The strike caused a loss of about 4,000,000 tons of coal, a deficiency which cannot be made up this year. Those furnaces which were damped down will not resume operation until ample supplies of fuel are assured. The fact that the strike has caused so little pressure for pig iron is regarded as ominous, indicating a great reduction in consumption, especially in the Midlands.

One effect of the strike is an increase in the scarcity of foundry material, since lack of fuel invariably reduces quality, and compels a larger proportion to be classified as forge material, instead of foundry. It seems likely that this condition will continue as fuel will be scarce during the winter. Coal production has been reduced 10 to 15 per cent by the operation of the seven-hour working shift.

In the Cleveland district forge iron appears to be superabundant, with the result that values have decreased, and the gap between forge and foundry values is widening. This must have an effect on Derbyshire and Northamptonshire prices, as some Midland buyers are now finding it convenient to go to Middlesbrough for their raw material. The partial cessation of some of the largest northern steel works using pig iron has allowed of a certain amount of shipment to foreign customers. The loadings for this month are almost double those for the same period last month. The stoppage of numerous Sheffield steel works also has liberated for export fair quantities of East Coast hematite pig iron. The necessary licenses are easily obtained, so that this branch of the business shows more activity than for many months.

Cleveland Material in Demand

Efforts are being made to decrease the make of forge iron, and increase the proportion of better qualities but not much progress is being made. As Cleveland has been placing foundry iron on the market at 160s ($33.84) per ton as compared with £9 7s 6d ($39.66) for Derbyshire No. 3 iron, there is some keen buying of the Cleveland material, especially as buyers do not anticipate a continuation of these competitive supplies. If the competition continues, the general expectation is that prices will be lower.

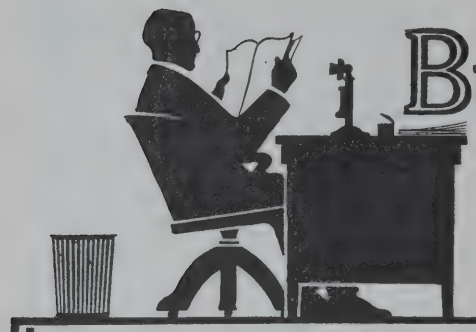
The announcement by Lloyd George that general import prohibitions are removed, effective Sept. 1, has directed attention to the question of protecting tungsten producers, and a demand has been made that the new industry be regarded as a "key" industry, and thus protected from injurious foreign competition.

The great Sheffield and North of England works, which were wholly or partially stopped by the coal strike, are resuming operations. A few companies, such as Cammell Laird & Co., Hadfields and Vickers had fuel stocks sufficient to keep their works operating during the strike. Brown Bayley & Co. have put 50 per cent of their men at work and will gradually increase the number employed. Other large Sheffield concerns are operating to a limited extent.

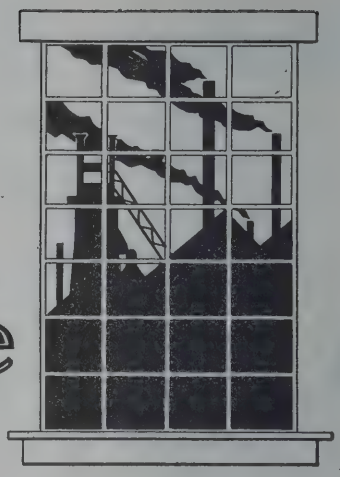
The holidays have interfered with joint action on the question of prices, but, either jointly or individually, finished iron prices are gradually being advanced to cover the additional cost of production due to more expensive fuel. Marked bars produced in South Staffordshire are now £25 ($100.75) and unmarked material £22 10s ($95.17) to £23 ($97.28). An advance of £2 ($8.46) has been made on ⅜-inch rounds, making the price £27 2s 6d ($114.74). Makers of puddled bars have been obliged to advance their prices 10s ($2.11) the present price being £17 5s ($72.97). Even at this figure, makers complain that production is unremunerative.

The galvanized sheet trade, suspended during the war is gradually being resumed. The selling price of sheets is £29 ($122.67) f.o.b. Liverpool. In the Birmingham district makers have been cautious in restarting mills, but present demand is such that if workmen could be obtained all the mills could be fully employed.

Substantial improvement has taken place in the Welsh tin plate trade, which is now busier than at any time since the armistice. The Welsh mills have two months' work on hand, despite keen competition from America. A peculiar fact is that American tin plates are selling in this country at 4s (85c), per standard box, below Welsh prices, but American supplies are limited and prices are now stiffening, so that the two products are expected soon to be quoted at about the same price. The recent advance in coal prices added 1s (21c) per box to the price of tin plates and satisfied buyers that no further reduction could be looked for. Accordingly there has been a rush to place new business. During the past few weeks prices have increased 3s (63c), and orders for delivery at the end of October have been placed in Swansea at 35s 6d ($9.52) a box. There is a world-wide demand for tin plates, and among eager buyers Germany is taking large quantities for shipment to Hamburg. There are many rumors as to the establishment of new tin plate mills in foreign countries, but these are not taken seriously, and the Welsh makers look for a big business.



Bessemer and siemens bars are now quoted at £14 ($59.22) but an advance is expected soon. Inquiries are frequent from the continent, especially from France and Italy. A deputation of Welsh tin plate makers and operatives now is visiting the United States in connection with the wage agitation which has disturbed the trade here, the idea being to report on American conditions of tin plate production, and their effect on competition between the two countries.



A vigorous effort is being made by British steel masters to meet American competition. The success of the latter has been reduced through the transport difficulties. Although a great deal of American steel has been ordered, and is understood to be on the way, the total arrivals make a small tonnage, and the inability to rely on such supplies intereferes with business with America.

As showing the inability of Sheffield to deal with the enormous amount of cutlery business offered it is stated that Sheffield makers have been obliged to refuse orders for 3,000,000 dozens of scissors. Most of this business has been passed on to America.

The operating deficit of the Gulf States Steel Co. in July was $9422 as compared with a deficit of $19,569 for June.

Little Stories of Business Life

Manganese Defies Electricity

"A FELLOW never gets too old or too wise to learn something new," said B. T. Bacon, of the Pickands, Brown & Co. organization, the other day. Inasmuch as Mr. Bacon has been selling pig iron for a good many years in Chicago and has seen pretty nearly everything there is to be seen in that branch of the industry it would seem that few things would remain as a novelty for him.

"I just got a phone message from the plant that the Interstate Iron & Steel Co. complains that a carload of pig iron, manganese 4 to 5 per cent, can't be unloaded. The magnet won't pick it up. Some of the same stuff has been tried at the furnace and it refuses to have anything to do with the magnet. There's pretty nearly 95 per cent iron in those pigs and that ought to be enough to make it attractive to a magnet."

But the fact remains that manganese of that proportion seems to make the pigs lose their magnetic qualities. The magnets have been tried with other iron and the manganese pigs have been tried with other magnets, always with the same result. Applied to a mixture of ordinary pigs and manganese pigs the former are picked out and the latter left inert.

Poetry In Tool Selling

SO far as is known, the Cleveland Duplex Machinery Co., 1224 West Sixth street, Cleveland, is the only machine tool dealer that combines poetry with such a prosaic thing as a proposal sheet on which prices are quoted to its customers. To date a series of four have been issued, namely: "If," by Rudyard Kipling; "Today," by Douglas Malloch; "Opportunity," by Walter Malone; and the prose poem "I Believe," by Rev. Charles Stelzle. They are printed on page 2 of the proposal sheet, size 11 x 8½ inches and the right edge is perforated so that it may be used for hanging upon office walls, with or without frame. This company also claims to be the first in the Cleveland district to make use of display space on the sides of buildings, billboards, ect., to advertise its business. Several of these advertisements now are complete and more are contemplated.

Plant Lice Tackle Iron

OPERATIONS of various sorts were curtailed and suspended in Egypt about 5000 years B. C. because of plagues of flies, locusts, etc., but the Groton Iron Works, Groton, Conn., recently had an experience which is unique in these ultra-modern days. For the first time so far as is known, plant lice had grown tired of their acustomed habitat and endeavored to change their diet to iron plant. The aphids or tiny green bugs were so numerous that they got into the eyes, mouths and ears of the Groton company's workmen and kept them busy driving them away. Biblical history thus has repeated itself. The invasion covered everything and everybody and it finally became necessary to close the entire works in order to wage a battle of extermination. Needless to say the bugs were not the victors and after the interruption, the plant resumed its accustomed work.

Worthy of His Hire

A SALES manager for a large export house was speaking of the wage question. This man has sold iron and steel for the largest of the American producers and is now selling it in international trade.

"Do you realize that the office men, the salaried men, are seriously considering the advisability of organizing? They feel compelled to take this stand, not because of any dissatisfaction they have with their employers, but for self-preservation against conditions that have arisen during the past four years.

"Big salaries in the office force can be counted on the fingers of your hands. Our salaries have not increased and there is no indication that they will be increased. The public believes us well paid because of the money turnover in the steel business, and it would surprise many to know that a man on the road selling iron or steel receives a smaller remuneration than the drummer selling hosiery, clothing or groceries."

Peculiarly enough this same suggestion that the salaried man is thinking of organizing was voiced by another steel employe the very next day.

Carnegie's "Steel Center"

ANDREW CARNEGIE was considerably given to prophecy and lived to see the realization of many of his forecasts, particularly in reference to the steel industry. He did not always hit it exactly but, as he once remarked to a friend with whom he was discussing his early business

ventures and failures, "the percentage was in my favor." Writing in the *New York Evening Post* of Jan. 12, 1901, he ventured this prediction: "The present center of steel is in the square made by a line drawn from Pittsburgh to Wheeling, northward to Lorain, eastward to Cleveland and south again to Pittsburgh. So far as I can see, there is nothing to change this center of steelmaking in this new century; it is in the central west and there it is likely to remain." Another prediction, set down on the same occasion, made good in less than the time limit imposed: "Ere the present century runs one-third its course, perchance only one-fourth, the United States is to make more steel than all the rest of the world combined and supply the wants of many lands besides our own."

Where Trains Don't Go

NOT long ago a representative of THE IRON TRADE REVIEW found the head of a machinery manufacturing company sitting at his desk in more or less of a dazed condition.

"A Peruvian was in here a little while ago," said the machinery man, "in an effort to locate a small lead rolling equipment that would suit his special requirements. He said that the roads over which the mill would have to be carried were in very bad shape and the means of transportation limited to the llama, and he wanted to know if the equipment could be made in small units which could be assembled at destination. As his plan was not practical I suggested that he buy a caterpillar tractor with which to haul the parts over the road. This had never occurred to the man from Peru and I understand that he is going to proceed along this line.

"One of the reasons for wanting the lead rolling equipment, the Peruvian said, was for rolling out sheets for roofing the buildings and huts in the mining camps. He stated that it had been customary to use galvanized sheets, which were obtained from the United States and taken to their destination on the backs of the llamas, for this roofing. However, the sheets were of such size that they had to be bent to fit over the backs of the mules, and the bending and the vibration on the backs of the animals had the effect of scaling off most of the zinc. He also stated that the intense heat expanded the metal so much in transit that the sheets lengthened out and worked against the ears of the llamas. As a result, the Peruvian assured me, nearly all of the llamas lose their ears through this friction."

A Time To Produce

THAT part of the war production which was at the cost of undue strain and fatigue is of course no longer necessary or justifiable but, making full allowance for this, the present let down of effort from the war standard represents a serious loss in production," recently declared Charles G. Du Bois, the newly elected president of the Western Electric Co.

"Moreover this material loss is accompanied by a mental unrest that threatens even more serious consequences. The relief from the emotional strain of war affects us all. Some realize soberly the difficulties that must be surmounted and appreciate that the only practical course of action is to work steadily ahead under the existing conditions. Others, who are less practical or whose minds have been inflamed by visionary ideas or strained perhaps by personal misfortune, think they see the dawn of a millenium and demand swift and radical economic changes in the unreasoning hope that somehow a great betterment will result.

"Rather than a lessening of effort, is it not the time to increase our effort, both for quantity and quality? Shall we be content with the total of what we have had and spend the rest of our strength in quarreling over its division? The one way is full of inspiration and promise, not only for a better America but for a better world. The other is both toilsome and unfruitful and seems easy only because we are used to it."

Expert Workmanship

WHEN he visited Scotland in 1903, the late Andrew Carnegie was enrolled as a burgess of the town of Kilmarnock, where he laid the cornerstone of a large technical school. It is related that he spread the mortar with consummate care and, as soon as the stone was in place, applied the level on all four sides. Then, finding it correctly on the square, he thumped the stone vigorously with the mallet and said with grave modesty: "I now declare this stone to be well and truly laid by an experienced workman."

Safety Exhibit

Will be Feature of National Council's Convention in Cleveland

The most complete collection of commercial and noncommercial safety guards, appliances, devices and accident prevention data ever arranged in the history of the National Safety council will be shown at the exhibit in Grays' Armory, in Cleveland, Oct. 1 to 4, inclusive, in conjunction with the council's eighth annual safety congress.

Every foot of space at the armory has been reserved. There will be 70 booths in which will be shown types of safety equipment applicable in every industry. The exhibit will be under the auspices of the National Safety council and the Safety Institute of America. Fully 350,000 cards of admission will be distributed among delegates and workmen of plants in and around Cleveland.

An unusual shop-lighting exhibit will be conducted by the National Electric Lamp association, of Cleveland, to which has been assigned the entire stage of the armory. This company will show a shop in operation, with three lighting installations, one poor, one mediocre and one ideal from the point of view of safety engineering. The light will be flashed on and off alternately while the advantages and defects of the different systems will be explained. This exhibitor will also show a model office and model drafting room with indirect light installations.

There will be several safe clothing exhibits including a special live model display of safe clothing for women and girls in industry. Sanitation and recreational facilities at industrial plants also will be shown.

Among other features will be an Americanization exhibit, an industrial housing exhibit and a women-in-industry exhibit, supplied by the United States department of labor. The sessions of the congress will be held in Hotel Statler.

Takes Casting Contract

The Wheeling Mold & Foundry Co., Wheeling, W. Va., has taken a contract for 300 tons of tunnel lining castings for the Lehigh valley railroad.

The new plant of the Elliott-Blair Steel Co., at Mercer, Pa., which replaces an old one destroyed by fire several months ago, has been completed and is ready for operation.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

GROUND will be broken within a few days for the plant of the Ward Tool & Forging Co., Latrobe, Pa., on a 5-acre site in West Latrobe and located on the main line of the Pennsylvania railroad a few hundred feet west of the Latrobe station. The plant will comprise a modern 1-story brick and concrete factory and office building and also a steel heat treating plant. It will be equipped with a line of modern automatic machinery to produce rivet sets, punches, dies, regular and special reamers of all kinds, chisel as a line of small special forgings and blanks and similar small tools as well automobile valves. It is expected to have the works completed and in operation by Jan. 1. J. W. Ward, formerly general superintendent of the Pittsburgh High Voltage Insulator Co., is president and general manager of the new company, while A. Otto, formerly of the Mesta Machine Co., Pittsburgh, is to be factory superintendent.

* * *

THE United States Crane Co., 122 South Michigan avenue, Chicago, has been incorporated under an Illinois charter, with capitalization of $250,000, to manufacture locomotive cranes. The company has just completed an order for cranes for the government and now intends to enter the industrial field with its new type of crane. A. W. Woodman is president and treasurer, A. Eilersgaard vice president and general manager and J. O. Hunt secretary.

* * *

THE B. F. Sturtevant Co. has closed is gray iron foundry at Hyde Park, Mass., and in the future will get all its castings for its manufacturing plant from Framingham, Mass. Work now is in progress on the remodelling of the old foundry to adapt it to use as part of the general plant. The company has felt for some time the need of increasing facilities at Hyde Park and it is this which has led to the abandoning of the foundry.

* * *

NEGOTIATIONS have been practically completed for the purchase by the New Departure Mfg. Co., Bristol, Conn., of the Meriden, Conn., branch factory of the Colt's Patent Fire Arms Mfg. Co., Hartford, Conn. The plant which has practically been idle several months, since the completion of the government's war contracts, is said not to have been a paying venture for the company. The New Departure Mfg. Co. has doubled its output, and is in the midst of the most flourishing season of its history.

* * *

NEGOTIATIONS are under way for the sale of the controlling interest in the Ferguson Steel & Iron Co., Buffalo steel fabricators, to B. L. Worden, manager of the Submarine Boat Corp., Newark, N. J. The Ferguson Steel & Iron Co. was organized six years ago and has enjoyed a steady expansion. It is the intention of the new interests to enlarge the facilities of the company. Capt. J. E. Ferguson, who founded the business and who has been its president since its inception, will continue with the company.

* * *

THE Embossograph Products Corp., Boston, incorporated under the laws of Massachusetts, July 25, with $1,000,000 capital, has purchased the plant of the Stanley Marine Engine Co., in Salem, Mass., and will occupy it for the manufacture of specialties, including the embossograph machine. It will remove the fixtures of a plant recently acquired in Cambridge, Mass., to the Salem plant. William F. Choate is president and William F. Stone, Newton, Mass., treasurer of the corporation.

* * *

THE Standard Oil Co. has purchased an 800-acre tract at Ironville, near Toledo, O., and has 600 men engaged in the construction of a $25,000,000 refinery. Several companies awarded subcontracts now have machinery and other equipment on the ground. The Great Lakes Dredge & Dock Co., Cleveland, is dredging a 60-inch concrete water main from the interior of the tract to the ship channel in the bay. It also is dredging out the bay near the Case farm shore so that ships may run in from the channel. The Standard company's plans provide for the construction of large docks where its property fronts on the bay. Foundations for 20 large stills are being installed by the Austin Co., Cleveland, and the James Stewart Co., Philadelphia, which has the contract for the powerhouse and the electrical work, has commenced construction of temporary buildings. A contract has also been let for 11 miles of water mains.

* * *

THE Hartford Electric Light Co., Hartford, Conn., has commissioned Stone & Webster, Boston, engineers, to prepare preliminary sketches for a generating plant station with a capacity of 100,000 kilowatts, or 125,000 horsepower, to be located on the Connecticut river in that city, which will use oil for fuel. The proposed plant is to be more than three times the size of the present plant at Dutch Point. The station at Dutch Point is equipped with facilities for using oil in cases of necessity. The high price of coal is a reason for the change.

* * *

BUILDING operations of the Ilg Electric Ventilating Co., Chicago, are to commence immediately and will be completed about Jan. 1, 1920. The first unit of the 2-story building will occupy ground space, 200 x 300 feet, and will be of reinforced concrete construction. It will be equipped with a sprinkler system and a concrete tower will enclose the sprinkler tank. The interior will have ample daylight throughout with adequate facilities for the comfort of employes. The total cost of the building will approximate $300,000. Alfred S. Alschuler, 1900 Steger building, Chicago, is the architect.

* * *

GROWTH of the sheet metal products business conducted by the Thomas & Armstrong Co., London, O., has made larger quarters necessary. The company has purchased from John Peard in that city foundry property adjoining the Pennsylvania railroad, including a building and four acres of ground. Work of razing the building already has commenced and in its place will be erected a modern 1-story structure 50 x 340 feet. Two auxiliary buildings, each 40 x 50 feet, also will be erected together with storage sheds, etc. Main offices of the company will remain in their present location until some time next year as plans call for completion of the new plant by Jan. 1.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

ORGANIZED as a sales company for the distribution of iron and steel pipe, the Superior Tube Co. has established general offices in the R. A. Long building, Kansas City, Mo. Yards already have been provided at a number of the principal oil fields and some attractive contracts have been closed for pipe with mills in the Pittsburgh district. The company has purchased the unfilled order book of the Moore-Kile Co., representing a substantial tonnage under purchase with several tube mills. In addition, those interested in the enterprise placed some large contracts several months ago after the organization was assured, with the result that the business was on an operating basis when the company formally began its career Aug. 15. Hoyle Jones, who is president and treasurer of the Superior Tube Co., was manager of sales at that city for the La Belle Iron Works, Steubenville, O., for 10 years. J. D. Holloway is vice president and secretary, with headquarters at the company's Pittsburgh office, from which point all purchase orders will be placed and contracts negotiated. He formerly was Pittsburgh manager of sales of the Wheeling Steel & Iron Co. L. W. Kile, 405 Exchange National Bank building, Tulsa, Okla., vice president and manager of sales, has charge of the company's interests in Oklahoma and Texas. He formerly was president of the Moore-Kile Co., Tulsa, which has been taken over by the new organization.

* * *

PLANS now are being prepared by Frank D. Chase, Inc., Chicago, industrial engineer, for the heating plant to be erected for the Samson Tractor division of the General Motors Corp., at Janesville, Wis. The first unit will have 2000 horsepower and will be equipped with well known makes of boilers, stokers, etc. An enclosed building will be built for coal storage and the coal will be delivered to the bunkers above the stokers through a track hopper, crusher and elevating system. Mechanical means will also be arranged for the removal of the ashes and a crane will be installed to handle both coal and ashes in an emergency as well as for the handling of storage coal to the track hopper. The heating plant will be doubled as the tractor plant grows.

* * *

EFFECTIVE Aug. 1, the promotion and inspection bureaus of the Universal Portland Cement Co. have been combined under the name of the service bureau.

J. H. Liberton, formerly engineer promotion bureau and inspection engineer in the general offices at Chicago, has been made the manager of the service bureau, and G. E. Warren, assistant manager. Department heads are: J. W. Lowell, eastern manager, Pittsburgh; J. H. Chubb, northwestern manager, Minneapolis; and O. L. Moore, general cement inspector, Chicago.

In combining the two bureaus, service will not be changed in policy or scope. Formerly their duties were distinct, the promotion bureau handling special service and giving information to users, while the inspection bureau had charge of physical tests at the mills.

* * *

CONSTRUCTION of an additional warehouse at Irvington, N. J., for Wheelock, Lovejoy & Co., Inc., Cambridge, Mass., is well under way. This 1-story brick building will provide approximately 16,000 square feet of floor space and will be fully equipped with modern facilities for handling large stocks of steel bars. The company intends to carry a stock of several thousand tons of high speed, carbon and alloy tool, open hearth alloy and machinery steels, and drill rods as well as spring and cutlery steels. An up-to-date heat treating plant will be installed. The warehouse is situated on the Lehigh Valley railroad and will have an extensive siding, capable of handling a large number of cars at one time. The completion of this building will make the third distributing point for warehouse shipments, others being located at Cleveland and Cambridge.

* * *

IT has been incorrectly reported that the Continental Axle Co., Edgerton, Wis., recently purchased the business, equipment and materials of the Higgins Spring & Axle Co., Racine, Wis., and that the Racine shops were to be abandoned and the stock and equipment removed to Edgerton. The purchase by the Continental Axle Co. involved only the machinery and stock of one department which the Higgins company inaugurated about a year ago, in which axles were manufactured for motor trucks, trailers and tractors. The Higgins Spring & Axle Co., which has been in business for the past 36 years, will continue on a larger scale than ever, in the manufacture of springs and axles for horse-drawn vehicles as well as springs for passenger automobiles, motor trucks, trailers and tractors. Up-to-date machinery is being installed in order that the demands of the trade for its products may be met efficiently. The Continental Axle Co. will not manufacture springs but will confine its efforts to produce axles for motor trucks, trailers and tractors.

* * *

THE Ramstack & Sons Mfg. Co. has been organized with a capital stock of $100,000 by Franklin Ramstack and sons of Milwaukee, who have retired from the J. E. F. Spark Plug Co. and will establish a new plant for the manufacture of patented ignition specialties for internal combustion engines. The J. E. F. company is completing a $45,000 machine shop in Milwaukee. The Ramstack company will take over the old J. E. F. works.

* * *

GRADING and track laying are in progress at the Niles, O., plant of the Youngstown Steel Car Co., Haselton, O., according to an announcement made by President William Wilkoff. Erection of the superstructure of the first unit of the plant, 80 x 400 feet, will begin in the immediate future. Mr. Wilkoff said. The erection of the first building is to be followed by a second of identical size. The new plant will begin operations by repairing cars for railroad companies and private owners. Industrial cars of smaller dimensions than standard rolling stock will be built early in 1920. It is declared the new plant will be in operation in January, 1920.

Must Face Fiercest Competition

Judge Gary Discusses World-Wide Economic Situation and Its Trend—Favors Resumption of Trade With Germany—Suggests Court Injunctions to Prevent Harmful Business Practice—Says Federal Control Fails

ECONOMIC progress in the world during the next few years will be won in the face of the fiercest competition that has ever been known, in the opinion of Chairman E. H. Gary of the United States Steel Corp., as expressed in his address delivered at the annual meeting of the American Bar association at Boston, Sept. 4. He advanced the hope that an international tribunal would be established to supervise the conduct of individual nations and to restrict all within the bounds of law, reason and justice.

Judge Gary, in his address, advocated the resumption of business relations with Germany and Austria immediately on the ground that goods from these countries are desired to supply wants and such purchases would have a favorable influence in re-establishing normal international exchange. The principle of international co-operation as distinguished from hostilities or selfish, secret isolation must be practised, he said, and fair and persistent competition between nations is necessary to the highest progress and prosperity. In practice the peace treaty and league of nations as finally established should be accepted by everyone, he declared.

Judge Gary pointed out the fundamental defects for success of governmental management. He advocated the use of injunction proceedings to insure against abuse or unfair practices by large aggregations of capital. He believed a nonpartisan tribunal made up of men specially qualified for such duties might properly be created to pass upon the various questions of corporation organization or management subject to final review by a federal court.

World Looks to America

"The inhabitants of other lands are looking toward us with various emotions; some with envy or jealousy, some with distrust, perhaps some with bitterness, and some with covetousness; but, it is believed, the large majority with friendliness, confidence and hope," said Judge Gary. "However this may be, when it comes to economic considerations there is little doubt that the peoples of every country are at present endeavoring to ascertain how they can most readily improve their pecuniary standing by reconstruction and readjustment; to secure their full share, or more, of the wealth of the world; and foreigners are gazing upon this country as the most fertile field of adventure and exploitation. They will carry their endeavor into the markets of nonproducing countries. By every known plan of operation, producers in Great Britain, France, Germany and other lands will seek to control or excel in the oversea trade. Long before the war was ended committees were formed and studies commenced by them with the idea of entering a post-war commercial strife for the world's business. These committees have personally, or through representatives, visited and for months remained within the limits of other countries making examination of properties, manufactories, terminals and transportation facilities, learning the various situations, and making reports on the same. They have been preparing for the most stubborn contest in economic warfare. Evidences of this disposition and intention have been seen on every hand. Besides this, the men occupying high official positions abroad are talking of these matters, lending encouragement and making promises of assistance by governmental action or otherwise. The credit of different governments will be furnished to private enterprise and management. It is reported that attempts have already been made by individuals, on their own account, to secure control of some of the most valuable and necessary raw products located in foreign lands, and this scheme will no doubt embrace the most desirable seaports for loading and delivery, and also the most advantageous coaling stations. Considerable success has already resulted. Arrangements, by contract or otherwise, have been or will be made for obtaining preference as to time and terms in the loading and unloading of goods, and also in the sale of materials and the obtaining of supplies. In short, everything practicable within the limits of law and opportunity will be done by foreign governments and their merchants to extend trade and to promote their own financial interests, even to the extent of proceeding within the natural domain of other outside spheres. The contest for commercial position and progress will be fiercer than ever before, with the difference, it is hoped, that there will hereafter be an international tribunal which will exercise supervision over the conduct of individual nations and will restrict all of them within the limits of law, reason, propriety and justice. Heretofore, wars have generally resulted from economic rivalries; from the struggle for commercial supremacy; and the late wars, in the opinion of many of us, were no exception.

"In justice to ourselves, we must be diligent and aggressive. We must conserve our strength and our resources. We must view the world situation from the point of experience, caution and wisdom. We should profit by the deliberations, discussions and conclusions of others. As of vital consequence there should be the most consistent and intense spirit of co-operation between all our people, between capital and labor, employers and employes, between the state and private interests, between the various groups of individuals or collection of individuals, between producers and consumers, between professionals and nonprofessionals. Good-natured rivalry, sharp competition, aggressive effort for legitimate success, faithful administration and observance of the laws, loyalty to country—all these must be encouraged and required; and everything that destroys or obstructs or interferes with legitimate enterprise, or limits prosperity, or that tends to minimize the motive for attempting to accelerate and sustain orderly progress in business, should be discouraged.

"From a economic standpoint, considering of paramount significance the question of benefit to ourselves, we ought to resume business relations with Germany and Austria at once. They are capable of producing many articles of commerce which we need and desire, and which are not produced elsewhere in like quality, much as it may be regretted.

"There are at least two good reasons why we should liberally resume the buying of German and Austrian goods. We desire them to supply our own wants, and besides the purchases will have a decided influence in re-establishing the rates of international exchange. We should seek and fully reciprocate the friendship of all other nations whenever it is compatible with principle. We should, if practicable, be neutral as between all other countries if we are to have their respect and confidence. Our position should be uniformly honest, dignified, kind, impartial, and in all respects above reproach. This is right and it will be profitable. It is a time for the exercise of patience and wisdom and the application of the highest ideals of propriety and virtue in dealing with world affairs. No man liveth to himself alone, and no nation liveth to itself alone. These are truths of daily illustration.

"Henceforth there should be maintained in practice the principle of international co-operation as distinguished from hostility, or selfish, secret isolation. Fair, honest, friendly, and persistent competition between nations is desirable and necessary to the highest progress and prosperity, but mean, tricky, overbearing and destructive competition

is unwholesome, unhealthful and disadvantageous to all who are affected. In practice the peace treaties and league of nations as finally established should be accepted by every one.

"The labor question at present is of commanding interest, first because labor is essential to economic growth and virility, and secondly because it is persistently sought by self-appointed leaders to enlist the sympathy and support of workmen in agitation for the substitution of the rule of force for the rule of law and reason. It is commonly designated as bolshevism. These agitators will not succeed in the United States. I have heretofore spoken on this subject and will not repeat. However, it may be observed that the antidote for this poison is plenty of work at reasonable rates of compensation when compared with the cost of living; healthful, safe and agreeable working conditions, opportunity for workmen to advance in positions according to merit; and a chance to invest their savings in the business with which they are connected. The employers must not and will not give the employes good ground for complaint, and intelligent public sentiment will exercise a controlling influence in preventing a return to barbarism. Employers and employes are under equal responsibility to the general public, of which they are an important part, to assist in maintaining industrial peace and prosperity.

"Probably it will be generally conceded that during the war, when the largest production of war material was demanded by our government for the military necessities of itself and associates in the war, the large and integrated concerns with highly perfected organizations and abundance of working capital, saved the situation. Except for them such necessities could not have been adequately supplied. What would have happened without their facilities no one could, with a feeling of certainty, express an opinion.

"But now the question occupying the thoughts of men, to a large degree, is what, if anything, can properly be done to conserve these means of economic stability and progress when war is not upon us and, let us hope, not threatening our future safety.

Government Control Fails

"Government, state or municipal control or management, is frequently suggested and stubbornly urged by public speakers and publicists. The reasons given ordinarily relate to the protection of the public against imposition or inefficiency, which is desirable. Here again experience, especially during the war, is illuminating. The government took over the possession and management of certain *quasi* public concerns, and, with the assistance of a large part of the previously formed organizations, realized some success in operation; but, as a total result, the experiment was a failure.

"During the war the government seriously contemplated taking over the management of additional large business lines, but after full investigation, discussion and consideration, concluded it would be unwise, although there were persistent and able advocates who favored the proposed action. The results fully justified the determination arrived at. It was believed by many that the government assumed the management of many departments of business activity other than those actually included in the government list. This was because there was co-operation between governmental agencies, such as the war industries board, and aggregations of private interests, represented by small committees, whereby voluntary arrangement was made for allocations of burdens or distributions of products. The control of operations, from the raw products to the finished materials was continued in the hands of the owners. There was clearly demonstrated during the war the value and practical benefit of private management as compared with public management. If it be said that government conduct of business has sometimes been successful the answer is that the same business in the hands of private, responsible individuals, with capital and success at stake, would have resulted more favorably.

"The ideal plan merely for the extension of enterprise, development of resources and the certainty of greatest production, with resulting increases to the public treasuries through taxation, assessment of dues, etc., and a corresponding benefit to the large numbers of workmen, would be to leave the matter entirely and independently in the hands of the private individuals who furnish the necessary capital and who would be inspired by the desire to reap pecuniary advantages. However, it is a patent fact that the ability of capital to accomplish desirable results also involves opportunity to do harm; that uncontrolled concentration of capital, with unbridled license in operations, may be injurious to the welfare of others, including the general public.

"In view and by reason of these conceded facts and considerations there has been attempted to establish by law a preventive against wrong and, in numerous instances, it has been invoked. However, it provides for the punishment of offenders and for the destruction in whole or in part of the property and business involved. This seems remarkable and irrational, especially after the experiences of the last few years, and on the eve of the greatest struggle for economic progress the world has ever witnessed. If the legal department of the government, basing action on its interpretation of the law, had been upheld in its contention, unlimited by the rule of reason, as applied by the courts to the industries of this great country, property and business in an alarming proportion would have been destroyed and its benefits to the general population eliminated in the effort to prevent future harmful practices.

"Proceeding on the assumption that large capital is desirable and necessary for the safety and legitimate progress of the nation, and yet that it must be controlled against possible harm, we are confronted with what has appeared to many to be a difficult problem.

"The general proposition is ventured that whenever it is practicable and effective, resort should be made to the prevention of threatened or possible harm, without destroying the property or business in question, and which can, if preserved, be of substantial benefit to the community and to the nation. This principle has sometimes been invoked by the courts so far as it was believed the provisions of the law permitted. Why not have the law so framed and administered as to allow the courts to cover the whole subject by injunction, rather than by the destruction of property or business? If capital is proceeding or threatens to proceed improperly, it can be restrained by injunction and the order enforced in the regular way. A court of equity should have, if necessary, enlarged powers of preventive remedy, unlimited by statutory provisions. If there is to be punishment inflicted it should be upon the individuals who are reprehensible, and not upon the owners, as stockholders or otherwise, of the properties involved, who are in no respect responsible for misconduct.

"If it be said that preventive measures are too late after there has been established unreasonable concentration of capital, which naturally and necessarily includes the power to do harm, or that in the administration of affairs pertaining to organization or management there is involved too much detail or complication for practical hearing and determination by a court, then it might be answered that there should be no objection to the whole matter of previous assemblage of capital by corporations, form of organization, or management of affairs being subjected to the consideration and decision of a competent nonpartisan tribunal, consisting of men selected for their peculiar qualification defined by the creative law, having adequate jurisdiction and powers, subject, however, to appeal and a final determination by a federal court concerning certain defined and vital questions relating to monopoly and restraint of trade. Federal incorporation or license is desirable. It might and probably would satisfactorily solve the problems relating to concentrated wealth in control of corporations."

Occupies New Quarters

The Pennsylvania Steel Export Co. has moved from the Widener building, Philadelphia, to a large building at 940, 942 and 944 North Front street that city. At the new location it has spacious offices, 10,000 square feet of warehouse space and a railroad siding into the warehouse. In addition to being the headquarters for the company's export business, the building will be stocked for a domestic warehouse business which will be operated by W. W. Baker & Co. The latter is a partnership whose members are the officers of the Pennsylvania Steel Export Co.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

JOHN N. ALLEN has resigned as general manager of the mining and transportation department of the Brier Hill Steel Co., Youngstown, O., effective Sept. 6, to accept the position of manager of the steel, coal and coke department of the National Trading Co., Swetland building, Cleveland. Mr. Allen has been in the steel industry for a number of years. He has been connected with the Brier Hill Steel Co. for seven years, going with the company just at the time it began building its steel plant at Youngstown. He first occupied the position of purchasing agent, holding this post for five years. For the last two years he has been supervising the mining, movement and purchase of heavy raw materials, as well as the transportation end of the business. Prior to his connection with the Brier Hill Steel Co., he was purchasing agent of the Lackawanna Steel Co. at Buffalo, for a period of six years, going to the Lackawanna company from the Illinois Steel Co. He occupied the position of chief clerk in the purchasing office of the latter for a number of years.

J. Roscoe Stroh, for some years assistant manager of the lining and transportation department of the Brier Hill Steel Co., has been made manager succeeding John N. Allen who resigned recently to become a department manager of the National Trading Co., Cleveland. Mr. Stroh's title is manager of the mining department, the old designation of the department having been changed to the present form with the retirement of Mr. Allen.

R. M. Pearce has been elected secretary and treasurer of the Standard Metal Products Co., Rock Island, Ill.

Adam Weppler, traffic manager for the Hershel Mfg. Co., Peoria, Ill., has resumed his duties after spending 10 months in army service in France.

J. Leonard Replogle, director of steel supply in the war industries board, and Bernard M. Baruch, chairman of the board, were members of the committee of 13 named by Secretary of War Baker to meet General Pershing upon his arrival in New York this week. Others on the committee were William G. McAdoo, John D. Ryan, Hugh Frayne, Thomas L. Chadbourne, and others, all of whom took some part in the governments war machinery supplying the overseas forces with fighting material.

George T. Clift has been made superintendent of the Nazareth Foundry & Machine Co., Nazareth, Pa.

A. M. Crain, Detroit, consulting engineer, has been made vice president of the Witherspoon-Englar Co., Chicago.

George L. Connelly has been made eastern sales manager with offices at 802 Kinney building, Newark, N. J., for the Cleveland Steel Tool Co., Cleveland.

C. A. Thayer has resigned his position with the Canadian Steel Corp., Ltd., Ojibway, Ont., to become chief engineer of the 118th street steel plant of the Interstate Iron & Steel Co., Chicago.

Harlow A. Varney has been made district sales manager for the Schroeder Headlight & Generator Co., Evansville, Ind., and has opened offices at 1051 McCormick building, Chicago.

D. B. Fulton, assistant to the chief engineer of the American Brake Shoe & Foundry Co., New York, has become assistant in the sales department of the Railway Steel Spring Co., Chicago.

E. McCormack has been made assistant to the president of the Railway Steel Springs Co., New York City. He formerly was treasurer and H. S. Bankhart succeeds him in that office. B. C. Dunn now is assistant treasurer.

William Parry, an assistant superintendent of the Sharon Steel Hoop Co. plants in the Youngstown district, has tendered his resignation. He will become assistant superintendent of the Union Alloy Steel Co., Canton, O. He was formerly connected with the Carnegie Steel Co. at Sharon, Pa.

A Brauer, who has been connected with the Mansfield Steel Corp., Detroit, for six months as body designer, has been promoted to the position of assistant to the general manager, in charge of production, quantity of surveys and production engineering.

Henry F. Merker has been appointed chief of construction of the new plant which the St. Louis Coke & Chemical Co. is erecting in Granite City, Ill. He has recently resigned as engineer of maintenance of way of the East St. Louis & Suburban Railway Co.

W. J. McClain, who has been associate manager of the Buffalo office of the Republic Iron & Steel Co., has been placed in charge of that office. He has had experience in the mills of the Republic company at Youngstown and while affiliated with the Carnegie Steel Co.

Enrique Touceda will be the speaker at the first of the regular monthly meetings of the Pittsburgh Foundrymen's association which is to be held Monday evening, Sept. 15, at the Chatham hotel, Pittsburgh. Mr. Touceda's topic is: "Some Pertinent Facts in Connection with Gray Iron and Malleable Castings."

Thomas Silk has resigned as superintendent of the steel barrel and range boiler department of the Whitaker-Glessner Co., Portsmouth, O. Since 1911, he had been connected with the company, developing, installing and operating new lines in stamping and fabricating sheet steel. He now fills a similar capacity at the plant of the Boyle Mfg. Co., Los Angeles.

A. A. Schneider, formerly with the raw materials department of the Midvale Steel & Ordnance Co. and Cambria Steel Co., has been appointed manager of the newly created raw materials division of the American Steel Export Co., Woolworth building, New York City. In his new field Mr. Schneider will handle imports, exports and domestic sales of pig iron, iron ores, ferroalloys, coal and coke. Development of markets for these commodities, particularly on pig iron, alloys and ore is a new undertaking for the American Steel Export Co. Mr. Schneider entered military service in 1917, as a lieutenant of field artillery, and prior to that had been assistant to H. F. Black of the Midvale and Cambria companies in Pittsburgh.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

GEORGE W. MIXTER, vice president, Deere & Co., Moline, Ill., has been named vice president and general manager of the Pierce-Arrow Motor Car Co., Buffalo. Mr. Mixter was graduated from Sheffield school of science, Yale university, in 1895, and soon after entered the employ of Deere & Co. He was advanced through various departments until he was elected vice president. When the United States entered the war, Mr. Mixter volunteered his services and was assigned to organize a department for the inspection of airplane parts and because of the efficient manner in which he discharged his duties, he was promoted to the rank of colonel. He will continue his business relations with Deere & Co., and also will retain his legal residence at Moline. Mr. Mixter also holds an executive position with the Van Brunt Mfg. Co., Horicon, Wis., manufacturer of grain drills and other seeding machinery, on of the constituent companies of Deere & Co.

Andrew H. Green, for many years manager of the Detroit plant of the Solvay Process Co., will become a vice president of the parent concern with headquarters at Syracuse.

G. E. Carpenter, for many years connected with the automotive industry, has been appointed purchasing agent of the Lincoln Motors Co., Detroit.

M. A. Davis has been appointed general manager of the Lapeer Tractor-Truck Co., Lapeer, Mich., to succeed C. W. Smith, who has been named a director of the company.

John G. Whittam has been appointed New England district sales manager of the Central Iron & Steel Co., Harrisburg, Pa., to succeed Joseph A. Brainerd, who is retiring on account of poor health. The district office headquarters are at 131 State street, Boston.

Marshall J. Root resigned recently as president of the Seneca Falls Mfg. Co., Seneca Falls, N. Y., lathes, to become vice president of the Fairbanks Co., New York. William H. Foxall, Rochester, N. Y., formerly treasurer of the Seneca Falls company, succeeds Mr. Root as president and Levi S. Chapman, Syracuse, has been elected president.

Raymond S. Coe, assistant advertising manager of the Norton Co., Worcester, Mass., has resigned because of ill health and returned to his former home in Cromwell, Conn.

N. Prentice Winchell Jr., advertising manager of the Coppus Engineering & Equipment Co., Worcester, Mass., has resigned to accept a similar position in New York.

Robert Field has resigned as foundry foreman for the Fairbanks Co., Rome, Ga., effective Sept. 15. On that date he will become associated with the pig iron and coke department of Fairbank & Co., Wade building, Cleveland.

Clarence R. Howe, for 18 years a salesman for the Providence, R. I., branch of the Crompton & Knowles Loom Works, Worcester, Mass., has resigned to become treasurer of the Glendana Silk Mills, Pawtucket, R. I.

H. C. Jones has become affiliated with the sales force of the J. R. Stone Tool & Supply Co., Detroit. For several years, he was with the Lodge & Shipley Machine Tool Co., Cincinnati.

Eric Zachau, electrical engineer in the crane department of Manning, Maxwell & Moore, Inc., Park building, Pittsburgh, sailed for Europe Sept. 6, and will visit Sweden, Norway and England.

S. Herbert Lanyon has been appointed Pacific coast representative of the Schroeder Headlight & Generator Co., Evansville, Ind., with offices at 507 New Call building, San Francisco.

Fred Gehbauer has been appointed special navy yard representative for the Chicago Pneumatic Tool Co., Fisher building, Chicago. His headquarters are at the company's Philadelphia office, 1740 Market street.

E. D. Westrip resigned recently after a service of 15 years as general manager of the Rockford Machine Tool Co. He expects to settle in Los Angeles. Prior to becoming affiliated with the Rockford company, Mr. Westrip was engaged in selling or manufacturing machine tools for many years and for several years was with Hill, Clarke & Co., Chicago, and later with the Treadwell Engineering Co., Easton, Pa.

Emlen S. Hare has resigned as vice president of the Packard Motor Car Co., Detroit. William Burleigh, assistant superintendent of the Packard company for three years, has become chief engineer of the Machinery Sales & Electric Co., Detroit.

E. H. Bull and D. A. Livensparger, the former for seven years in the engineering department, and the latter for nine years in the sales department of the Green Engineering Co., have taken over the Chicago sales office of that company.

H. C. Bayless, formerly mechanical engineer for the Great Northern railroad, has been made combustion engineer and manager of the Superior Pulverizer Co., Chicago, in charge of engineering, sales and general supervision of coal installations.

Robert S. Lehman, superintendent of the grinding department of the Studebaker Corp. for the last seven years has organized the Lehman Precision Grinding Co., with plant at 40 Lafayette avenue, east, Detroit. Wilmer Rumsey is vice president and Ernest Steiler, secretary and treasurer.

E. L. Sullivan now represent the Green Engineering Co., East Chicago, Ind., in the Pittsburgh district, which includes western Pennsylvania, eastern Ohio and western West Virginia. For 10 years, Mr. Sullivan has represented the McDonough Regulator Co., six years in Chicago and four in Pittsburgh.

P. W. Hood, assistant secretary of the Timken-Detroit Axle Co., has been made sales manager and will be assisted by Advertising Manager Frank N. Sim. C. G. Rowlette, formerly assistant treasurer, has been elected treasurer to succeed C. W. Dickerson, who will remain as secretary and credit manager.

T. Phelps Hollister, Windsor, Conn., who recently received his discharge from the aviation section of the navy, has taken charge of the branch office of the Pratt & Whitney Co., Hartford, Conn., which is to be opened in Pittsburgh. Before the war Mr. Hollister was connected with the Cincinnati office of the same company.

Uncertainty Subdues Optimism

Resumption of Speculative Activity in Stocks Brings Forth Criticism—Credit for Legitimate Trade Threatened—New Equipment Export Company Planned—American Locomotive Report—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

WALL street's outbreak of speculation last week in the face of a number of uncertain factors in the economic outlook has been characterized as exceedingly unwise by some sober observers and likened to the "orgy of extravagant spending" prevalent in the country, by others. The suddenness with which the stock market checked its flight upon the news of Samuel Gompers' message to President Wilson, soliciting his aid in arranging a tete-a-tete between the unions and Judge E. H. Gary, indicated the uncertain foundation of the movement.

The market had seized upon the apparent lull in the labor situation and proceeded to work up a speculative fever over it. The Gompers message destroyed illustions respecting the complete quietude of labor and the market was brought back to earth again to wait further developments.

The three outstanding factors in the present situation are the labor unrest, the high prices of necessities and the demoralized foreign exchanges. In his speech before the American bar association in Boston last week Judge Gary said that the best antidote for bolshevism was plenty of work with reasonable wages in comparison with the cost of living. If this prescription is sound America has nothing to fear from revolutionary tendencies for it is applying the remedy in liberal doses. Not only is there no labor surplus but most sections of the country report a shortage that is acute in some lines of business. Despite the ravings of the union leaders and agitators who are seeking to awaken a class consciousness among labor, wages are high almost without exception. As Judge Gary pointed out the only actual sufferers from the high cost of living are those subsisting upon fixed salaries or incomes.

The majoritiy of American laboring men think too straight to allow themselves to be led into the folly of killing the goose that lays the golden egg. The worldwide shortage of goods assures a market for almost every manufactured product that can be turned out for months to come, providing industrial conditions are not upset, and this means plenty of work at high wages with a receding cost of living as production catches up with the demand.

In its current monthly bulletin the federal reserve board points out why in its opinion prices are high in this country. It says America is exporting twice as much as she is importing and is failing to conserve foods or goods that Europe may be supplied. As a result Americans are forced to compete with Europe in buying necessities. No real remedy for the high prices is seen by the board unless the country is willing to accept its advice to "work and save," and to increase production to meet abnormal exports. Of course prices could be smashed ultimately, by checking exports, but this might be fatal to Europe, as well as harmful to our own prosperity. As a matter of fact, however, the economic forces of the foreign exchanges are bringing about a decrease in exports. In July exports to Europe fell 38 per cent below those for June.

In a statement issued by Thomas W. Lamont, partner in the banking firm of J. P. Morgan & Co., member of the American peace mission and of the supreme economic council, the immediate ratification of the treaty of peace and extension of financial aid to Europe is urged. Prolonged delay Mr. Lamont says will mean starvation for millions and chaos in Europe. Herbert Hoover last week declared that large stores of food were piling up in European ports, while starving nations were unable to buy them because of the lack of credits. England is meeting the situation by the formation of a plan to extend $130,000,000 in credits to encourage trade with disorganized Europe.

The plan of financing as adopted by the British board of trade and disclosed in recent cables provides for the government to make advances up to 80 per cent of the cost of goods. Before making these advances however the board of trade requires a guarantee from an approved bank in the buyer's country undertaking to deposit and maintain sufficient currency at exchange rates to cover the cost of the goods plus a 15 per cent margin. If application for an advance is accompanied by a banker's guarantee of sterling payment at maturing of the bill it will receive preferential treatment. If with these safeguards the seller fails to obtain full payment the board of trade will bear the proportion of the loss represented by its advance. It will thus be seen that Great Britain not only is prepared to make export sales possible by arranging credit at the time of purchase but it will undertake to guarantee payment to the British seller. The federal reserve board and other American officials have denounced government participation or guarantee for exports, declaring that the task was one for private enterprise.

No comprehensive financing plan can be formed until the attitude of this country toward the treaty is definitely settled. However an important step was taken last week by the house in passing the senate bill permitting national banks to invest up to 5 per cent of their resources in foreign financing corporations. Action was expected to be taken in the senate this week on the Edge bill which would authorize the organization of great corporations for the extension of credit to Europe. As was indicated by the statement of President Fletcher in the annual report of the American Locomotive Co., railroad equipment concerns are organizing a railway equipment combination, under the Webb act, to make it possible for American equipment makers to accept some of the great volume of foreign business being offered. Acceptance of this business involves the necessity of extending credits of from 5 to 10 years a burden which individual companies do not care to assume.

Stock is Transferred

Youngstown, O., Sept. 8.—Rearrangement of the holdings of the Cullinan interests has resulted in the transfer of stock held by the Petroleum Iron Works Co. in the Pennsylvania Tank Car Co. and the Pennsylvania Tank Line Co. to the American Republics Corp. in return for an interest in that concern. Arrangements

for the transfer of the stock were made at the recent annual meeting of the Petroleum Iron Works Co. at Petroleum, O. The Petroleum Iron Works Co. and the Pennsylvania Tank Car Co. operate plants at Petroleum, in Trumbull county.

American Locomotive Has Best Year in History

Although unsettlement of the railroad problem is paralyzing new domestic business and the upset exchanges and difficulties of arranging foreign credits are retarding the volume of foreign orders, the American Locomotive Co. reports the most successful year in its history ending with June 30. Gross earnings were $108,923,524 against $80,588,070 in 1918, while the balance before common dividends and $5,000,000 reserved for improvements to offset the reduced hours of work and increased cost of labor, amounted to $10,262,567 as compared with $4,161,137 the preceding year. Unfilled orders on hand when the war ended sustained production during the six months of 1919.

The balance sheets show current assets of $53,507,069 and net working capital of $35,508,423. The inventory has been decreased from $25,411, 834 on June 30, 1918, to $11,018,309 on June 30, 1919. In his statement to stockholders President Fletcher says that manufacturing expenses during the year included $1,155,556 for depreciation and $548,491 covering expenses during the war for new patterns and drawings. The tonnage during the year he said was 23 per cent greater than the 1918 production. This was due to the high records of output obtained during the fore part of the fiscal year. The amount of unfilled orders on the books June 30 was $16,034,678 compared with $74,736,543 on June 30, 1918, and $54,517,373 on Dec. 31, 1918. Improvements are in progress at a number of the company's plants.

The Pittsburgh plant has been closed down to concentrate business in more efficient works. During the year the company completed 1181 standardized locomotives for the railroad administration. President Fletcher does not hope for further domestic business until the general railroad question has been decided. In order to encourage foreign business he suggests a combination of railroad equipment and allied companies together with banking interests under the form of a foreign railway equipment finance corporation. This would be permissable, he explains under the Webb act. The company has decided to change its fiscal year to correspond with the calendar year. Following is the comparative income account:

	1919	Increase
Gross earnings	$108,923,524	$28,335,453
Mfg., maint. and admin. exp. and dep.	91,569,915	21,211,349
Manufacturing profit	17,353,608	7,124,349
Interest, etc.	418,252	118,835
Net earnings	16,935,356	7,005,267
Deduct for U. S. and Canadian income and war profits taxes	4,922,789	903,838
Available profit	12,012,566	6,101,429
Dividends—		
7 per cent pfd.	1,750,000	.....
6 per cent com.	1,250,000	.....
Surplus	9,012,566	6,101,429
Reserve for additions and betterments	5,000,000	4,000,000
Net credit to profit and loss	4,012,566	2,101,429

Lake Superior Corp. to Build Shape Mill

The decline in earnings of the Lake Superior Corp., from $6,551,495 in 1918 to $5,441,574 in the 12 months ended with June 30 was the logical result of the cancellation of war orders and the lack of sufficient peace business to keep the mills operating at above 50 per cent during the first half of 1919, according to President Wilfred H. Cunningham in the company's annual report. Canadian buyers who have been holding in anticipation of lower prices, he declares, will soon be forced into the market and repairs and replacements must in due course absorb considerable quantities of steel.

In his report the company's president announces that the directors have concluded that the time has come for the establishment of a structural mill —one that in addition to rolling beams will be able to produce heavier and longer rails to meet the increasing demand. Contemplated improvements along this line are held vital to the company's success. The new plant will be completed in 18 months it is estimated. The report shows the pig iron production of the Algoma Steel Corp., the Lake Superior Corp.'s chief subsidiary, during the year was 336,657 tons against 314,188 the previous year; of steel ingots 414,932 tons against 499,712 in 1918; of steel products 322,011 against 329,438; of coke 406,398 against 379,040. The principal items of the income account of the parent and all subsidiary companies follows:

	1919	1918
Net earnings	$5,441,574	$6,551,495
Interest on bonds of subsidiaries	1,235,710	1,315,041
Sinking fund	324,463	278,186
Reserve for depreciation	260,000	1,508,912
Reserve against abnormal cost of new plant	365,000	1,000,000
For general depreciation	1,500,000	1,500,000
Dividends to Lake Superior Corp.	1,054,000	705,000
Surplus	1,589,388	668,292

Strong Undertone

Rules in Coal Products Market—Benzol Active—Toluol Gains

New York, Sept. 8.—A strong undertone is noted throughout the coal tar products market. Benzol, both pure and 90 per cent, is moving rapidly, and this buying, in conjunction with a heavy demand for motor benzol, is keeping supplies at a minimum. The market on pure benzol may be quoted at around 25 to 29 cents per pound, and 90 per cent material at 24 to 28 cents.

Considerable activity is in evidence in toluol, turpentine and rosin manufacturers closing on good quantities. The market is very firm at 26 to 30 cents per gallon. One degree toluol is holding at 29 to 33 cents. While these prices are unchanged from last week, there is undoubtedly a tendency upward. Solvent naphtha may be quoted at 22 to 27 cents for both spot and contract business.

Although the drug trade is buying but little, large quantities of naphthalin are being moved. This is resulting from a heavy demand by the dye industry, which has virtually stripped the market of spot material. Some sellers now are considering no orders for shipment before the middle of October. Prices have not been changed however, flakes still holding at 6½ to 7½ cents per pound and balls at 8½ to 9½ cents.

While there is a strong undertone to the sulphate of ammonia market, prices continue unchanged. Sulphate on the contract basis is holding at $3.25 to $3.40 per 100 pounds and on the spot basis, at $3.40 to $3.65. Buying still is being confined principally to the fertilizer industry.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Tuluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.65

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.25 to 3.40

Machine Tool Inquiries Increase

Though Few Sizable Lists are Current Sellers Concentrate on Many Smaller Requests—Goodyear Tire Issues Formal List—Columbia Axle Buys —Prices Continue Upward—Crane Movement Lags

INCREASING inquiries feature the machine tool market of practically every district. In the middle west, some sellers claim that business is 50 per cent better than in 1914 before the war which, however, could not be regarded as an active period. This improvement comes from concentrated effort on many small inquiries rather than upon large lists, although some fair sized ones are being closed in Cleveland. These include one from the Goodyear Tire & Rubber Co., Akron, O., for shipment to Los Angeles and one from the Wisconsin Parts Co., Oshkosh, Wis., for about $40,000 worth of equipment. Chicago dealers are at work on the tool room requirements of the Moline Plow & Tractor Co., Moline, Ill., which recently suffered a fire. Its machine shop list is expected shortly. Allied automotive industries lead in the demand in practically every selling center.

Sizable orders for tools have been received from the Columbia Axle Co., Cleveland, and from Montgomery, Ward & Co., Chicago, the latter taking about $100,000 worth. Makers are kept so busy on orders from dealers that attractive deliveries no longer are possible, the best obtainable being from 10 to 12 weeks and in some cases four months. Prices continue to tend upward, an increase of 25 per cent on drills being slated for Oct. 1. Recent increases noted include one of 15 per cent on milling machines and one of 10 per cent on punch presses.

With the advent of more settled labor conditions, it is thought a great deal of business will come out. This is true of cranes and other heavy equipment in Pittsburgh, where several steel companies are withholding action on known needs, not so much on account of price as on account of the situation as regards labor. Railroads have commenced to make some slight purchases, mostly for one or two tools for replacement purposes. The Cumberland Valley railroad was the biggest purchaser in the east, while the Santa Fe has asked for bids on a few machines required by its different shops in the west.

Japan continues to occupy the leading position among export buyers. A slight improvement is noted in the export market and it is indicated many sales would be made abroad were some credit plan perfected or if exchange rates would become stabilized.

Crane inquiries, for the most part are small, the largest reported coming from the Cambria Steel Co. for a 75-ton ladle crane and four 10-ton overheads. Other small inquiries come from S. L. Smieth & Co., New York City; York Safe & Lock Co., York, Pa.; Campbell Foundry Co., Harrison, Pa.; Meade-Moorison Mfg. Co., East Brooklyn, N. Y.; the Standard Oil Co., Bayway, N. J., and the Goldberg Iron & Steel Co., Columbus, O. Recent buyers of cranes include Midvale Steel & Ordnance Co., Coatesville, Pa.; the Bethlehem Steel Corp., Sparrow's Point, Md.; Richmond Lebering Co., New York, for the Island Refining Co. of Louisiana; the Witherow Steel Co., Corapolis, Pa., and the Hyper-Humus Co., Newton, N. J.

East Demands Miscellaneous Tools in Small Lots

DEMAND in the eastern machine tool market is comprised chiefly of a widely scattered volume of small inquiries. Virtually no new large lists are current, and buyers appear to be confining their purchases to single tools needed for replacing old equipment or rounding out installations. The railroads are said to be doing considerable buying of this character. Various lines are in the market, buying one and two tools at a time, and are stated to be doing, in the aggregate, more trading than in months. The only recent large single order, however, for railroad account was that involving about 30 machines for the Cumberland Valley road which was placed within the past month.

Despite the depressing influence of the labor situation during the past few weeks, several sellers report that their sales have been increasing steadily since early in May. These interests generally appear to be optimistic regarding the fall buying. Developments in the export market are said to be more favorable, and there appears to be a perceptible improvement in labor conditions throughout the east. The largest export buyer of late has been Japan, this country buying heavy quantities of metalworking equipment of practically all descriptions. Japan, as a matter of fact, has been a large purchaser for several months.

Prices of machine tools continue to tend upward. One of the heaviest advances now in prospect is a 25 per cent advance by one of the leading drill manufacturers scheduled for Oct. 1.

Although there have been no instances of large buying in the eastern crane market during the past week, there has been a fair amount of trading. The Midvale Steel & Ordnance Co. has placed a 40-ton ladle crane for Coatesville, Pa., with the Alliance Machine Co., at 15-ton overhead for the Sparrows Point, Md., plant of the Bethlehem Steel Corp., is also understood to have been placed with the Alliance company. No action, it is said, will be taken on the three other overhead cranes for the Sparrows Point plant at this time, the inquiry

Consistently uniform—

LUDLUM STEEL COMPANY, General Offices and Works: WATERVLIET, N. Y.

Branch Offices: Chicago Cambridge, Mass. Detroit Buffalo New York City Cincinnati Cleveland Philadelphia Pittsburgh

only being issued for estimating purposes. Some sales have also been reported in the locomotive crane market. The Richmond Lebering Co., 120 Broadway, New York City, has bought a 15-ton crane from the Ohio Locomotive Crane Co. for the Island Refining Co. of Louisiana. The Witherow Steel Co., Corapolis, Pa., has purchased a 20-ton used Orton & Steinbrenner crane from the Titan Equipment Co., 30 Church street, New York City. The Hyper Humus Co., Newton, N. J., which recently was inquiring for a new 15-ton locomotive crane, has closed upon a used crane of similar capacity.

Possibly the largest new business now pending is an inquiry by the Cambria Steel Co. for a 75-ton ladle crane, and four 10-ton overhead cranes. S. L. Smieth & Co., 50 Church street, New York City, is inquiring for a 10-ton, one motor crane, with 47-foot span. The York Safe & Lock Co., York, Pa., is inquiring for a 5-ton overhead crane. There is some confusion over the requirements of this company, as two other inquiries, one for a 10-ton crane and another for a 3-ton crane, have been issued, and it is not clear as whether these inquiries represent three separate requirements. It is generally believed they do not. The navy department is in the market for a 10-ton overhead crane for a project at New Orleans. The Campbell Foundry Co., Harrison, Pa., it is understood, will be in the market shortly for a least one overhead crane for a new addition. W. A. Bishop, Newark, N. J., is architect in charge of construction. The National Marine Engineering Works, Scranton, Pa., has withdrawn its inquiry for a 10-ton overhead crane, the company having for the present at least, given up a plate mill project for which the crane would have been required. The Meade-Morrison Mfg. Co., East Boston, Mass., is expected to close shortly upon the 10-ton crane inquired for a few weeks ago. Uncertainty as to developments in the labor situation is said to have been the delaying factor. The Standard Oil of New Jersey, 26 Broadway, New York, is asking for figures on one 20 and one 30-ton locomotive cranes for Bayway, N. J. It is believed that action will not be taken for some time.

Moline Plow Issues Formal List

SELLING of machine tools in the Chicago district continues to be made up largely of a considerable number of single tools or small lots. Dealers in general find this character of trading more profitabe and satisfactory. An advance of 15 per cent on milling machines and 10 per cent on punch presses has been announced recently by some manufacturers who made a reduction several months ago which was not followed by others in the same lines. Present advances are made to equalize prices with those of other makers.

The Moline Plow & Tractor Co., Moline, Ill., has completed its specifications and is taking bids on toolroom equipment to replace that lost in a recent fire. Specifications have not yet been made up for the equipment in the general machine shop, which also was burned. The latter consists largely of chucking lathes, screw machines and similar equipment. For the tool room the company will require a 30 to 36-inch planer, a horizontal boring mill, a 15 to 24-inch shaper, universal milling machine, 24-inch upright drill, four-foot radial drill, 10 lathes, 14 to 24-inch, speed lathes, tool and surface grinders and single spindle high-speed ball bearing drills. Montgomery, Ward & Co., Chicago, have placed orders for practically all the equipment for its engine plant at Springfield, Ill., totaling about $100,000, and including turret lathes, drills, milling machines, tapping machines, grinders and miscellaneous tools. The Santa Fe railroad has recently asked bids on a few machines required by its various shops.

The Belden Mfg. Co., Chicago, is building a wire factory for which equipment will be required. The Anderson Foundry & Machine Works, Anderson, Ind., will build two additions. The Moore Plow & Implement Co., Greenville, Mich., will build a foundry. The Auto Specialty Mfg. Co., St. Joseph, Mich., will build four additions to its plant. The Bayer Steam Soot Blower Co., St. Louis, will build a plant.

Tool Demand Increases in Pittsburgh

GOOD demand exists in the Pittsburgh district for machine tools and delivery dates are being extended as the manufacturers become booked up. From 10 to 12 weeks now is the best delivery that a number of makers of lathes, drills, millers and shapers are promising. On a recent order for a 26-foot lathe taken by a Pittsburgh agent, delivery will not be made short of f[illegible] prices show much strength and announcement recently was made by a Rockford, Ill., company of an advance in upright drills which practically restores the war price.

Little has been going on in cranes and other heavy equipment lately, but a large prospective business is in sight and likely to seek manufacturers with the advent of a more settled labor situation. Steel manufacturers, who have had inquiries out for much equipment are believed to be delaying the placing of orders less on account of prices than because they want to be certain that they are not going to have plant suspensions.

Considerable Business Current in Cleveland

BETTER than in several months and approximately 50 per cent larger than at this period in 1914, prior to the war, machine tool business in Cleveland continues on a satisfactory basis for sellers. Miscellaneous industries are well represented in the buying and in the increased number of inquiries received, although the automobile industry and lines of activity related to it continue in the lead. Talk of price increases continues to be heard, particularly on drills. Makers are requiring longer periods of time to make deliveries. Some sellers expect the present activity to continue well on into the winter and are concentrating on closing up prospective purchasers quickly. The D. M. Osborne Machinery Co., Cleveland, which is specializing in the sale of lathes and upright drills, reports an active movement of those types of tools.

One of the biggest transactions before sellers is the list referred to last week from the Goodyear Tire & Rubber Co., Akron, O., for shipment to the Goodyear Tire & Rubber Co., of California, Los Angeles. The formal list calls for one No. 3 B Kearney & Trecker milling machine with vise, universal head and all attachments; one No. 3 Cincinnati vertical milling machine, revolving table and vise; one 20-inch Gould & Eberhardt, Ohio or American shaper; one 4-foot radial drill; one 20-inch drill press with back gear; one 24-inch drill press with sliding head; one 14-inch center single spindle high speed drill press; one 1½-inch Acme bolt machine complete with dies, tools, etc.; one 12-inch Peerless high-speed hack saw; one 24-inch swing engine lathe with 8-foot bed, complete with taper attachment; one 30-inch swing engine lathe, 16 feet between centers with large steady rest; one 36-inch Bullard vertical turret lathe; two 62-inch King boring mills; one No. 1 Cincinnati universal cutter and tool grinder; one 42 x 42-inch x 16-foot open-side planer, and one portable key-seater with cutters to take up to 7⅞-inch shaft diameter

Store Your Coal, NOW!

THERE is a grave possibility of another coal shortage this winter. It will pay you therefore to start at least a modest coal storage plant to meet an emergency of this kind.

The Link-Belt Locomotive Crane makes an ideal machine for putting coal into and taking it out of storage.

We have built many coal storage plants employing our cranes and can give you some interesting facts and figures showing the low cost of handling per ton. Write to nearest office.

LOCOMOTIVE CRANES

Say you saw it in THE IRON TRADE REVIEW

and keyways up to 1½ inches square. All these machines are to be arranged for 44-volt, 50-cycle motors. Another fair sized list, approximating $40,000 in value is issued by the Wisconsin Parts Co., Oshkosh, Wis., maker of axles, etc. It comprises automatic chucking machines, hand screw machines, automatic bar machines, shaft machines such as Fay or Lo-Swing and heavy milling machines. It recently purchased about $40,000 worth of tools but needs an additional number to fill its requirements. Quotations should be sent to W. F. Rockwell, general manager or R. L. Murphy, purchasing agent.

Smaller purchases are frequent and one fair sized one was consummated last week with the Columbia Axle Co., Cleveland, the Cleveland-Duplex Machinery Co., that city, taking its order for approximately 90 per cent of its requirements. Among the tools purchased are a Potter & Johnson automatic, a Baker drill, a multiple spindle drill and a lathe. It still is looking for a press and some other equipment. The Lang Body Co., Cleveland, which has increased its capital from $500,000 to $1,500,000, and which is building a 4-story extension, giving it 111,000 square feet additional floor space, closed on a large planer. It will not place orders for the remainder of its needed equipment until early in 1920. Another concern who will be in the market shortly after Jan. 1, next year, is the Auburn Mfg. Co., Auburn, Ind., automobile maker. The Lincoln Motors Co., Detroit, is understood to have purchased considerable equipment recently and is wiring to hasten deliveries. The Electric Auto-Lite Corp., Toledo, closed on one No. 11 plain grinder.

Among those inquiring for small lots or single tools are the Timken Roller Bearing Co., Canton, O., which is putting up a $15,000 addition. It wants among other tools, two universal grinders. The Erie Forge Co., Erie, Pa., wants a 54-inch lathe. Another concern who is looking for a large lathe is the Crucible Steel Co. of America, Cleveland, while the Crucible Steel Forge Co., that city, wants a 60-inch cold cutting saw. The Electric Vacuum Cleaner Co., Inc., Cleveland, wants a No. 1½ milling machine and a drill press, while the Ohio Pottery & Glass Co., that city is advertising for a Cleveland automatic with 2¾, 3¼ and 3¾ chuck capacities one each 6-inch and 11-inch Gleason double gear generators; one No. 2 La Pointe broaching machine; one Cincinnati No. 3 milling machine and one Landis bolt threader. The Acklin Stamping Co., Toledo, O., wants among other equipment, one tool room lathe. The Goldberg Iron & Steel Co., Columbus, O., wants shears and a locomotive crane with magnet for its enlarged scrap yard. The P. A. Geier Co., 5112 St. Clair street, Cleveland, is said to be in the market for considerable equipment for a 2-story addition, 39 x 301 feet. The Louisville Frog & Swith Co., Louisville, Ky., also is in the market for some equipment.

Considerable interest is manifest in the $25,000,000 refinery project of the Standard Oil Co., at Ironville, near Toledo, O. While no formal list of equipment requirements is out, it is expected that these will be large and include not only a number of cranes but pipe cutting and threading machinery as well as general machine shop equipment. The Peerless Motor Car Co., Cleveland, is expected to indicate additional machinery needs for an addition it is building, 33 x 333 feet, and a list is awaited from the Cleveland Tractor Co., that city, which is putting up two additions. Other projects in which equipment sellers are interested include a plant for the A. M. Mayle Mfg. Co., Toledo, O., dies, jigs and tools; a factory for the Elyria Steel Products Co., Elyria, O., or Cleveland, in which steel stampings, automobile parts, etc., will be manufactured; a building for the American Metal Products Co., Cincinnati; a new building, 50 x 340 feet, for the Thomas & Armstrong Co., London, O., manufacturer of sheet metal products, with two other auxiliary buildings, 40 x 50 feet each.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

WESTMINSTER, VT.—Plans are being figured for a 1-story, 30 x 120-foot addition to the machine shop of the Abenaque Machine Works.

BOSTON.—The Compressed Shafting Co., 393 Dorchester avenue, is taking bids for a machine shop, 1-story, 60 x 320 feet.

BOSTON.—The Renim Specialty Co. has been incorporated to build electrical machinery with $50,000 capital by Arthur Watson, William J. Barkley and Frank G. Crowley.

BOSTON.—The L. E. Fosgate Co. has been incorporated to build farm machinery with $10,000 capital by Leo E. Fosgate, William H. Heintz, West Medford, Mass., and John J. Lane.

BOSTON.—The F. & F. Mfg. Co. has been incorporated to make mechanical products with $5000 capital by Ferdinand Christensen, Frazier L. Davis and William Flotow.

BOSTON.—The Magee Furnace Co., Inc., has been incorporated with $60,000 capital by Alfred P. Stockbridge and Alfred E. Perrin, both of Somerville, Mass., and Clarence F. Wiley, Taunton, Mass.

BOSTON.—The Winnier-Erickson Engine Co. has been incorporated with $100,000 capital by Albert J. Winnier, Natick, Mass., Walter E. Erickson, Brookline, Mass., and Samuel W. Culver, Dorchester, Mass.

CAMBRIDGE, MASS.—Page & Shaw, 18 Ames street, have awarded contracts for a plant and power house, 6-stories, 60 x 140 feet.

FALL RIVER, MASS.—The Rochon Mfg. Co., Inc., has been incorporated to make screens, etc., with $100,000 capital by Charles Rochon, Arthur J. B. Cartier and Horace Chenard.

GREENFIELD, MASS.—The Woods' Method Corp. has been incorporated to make castings, dies, machinery, pumps, etc., with $99,000 capital by Edward D. Woods, John L. Eppler and M. B. Markle.

HOLYOKE, MASS.—David H. Barowsky, scrap iron and metals, is having plans made for a 4-story warehouse.

NORTHAMPTON, MASS.—The forge shop of the C. A. Maynard Hoe Mfg. Co. was damaged by fire recently.

SOUTH BOSTON, MASS.—Plans are being made for a 2-story, 45 x 100-foot addition to the machine shop of the Underwood Machinery Co.

SPRINGFIELD, MASS.—The Duckworth Chain & Mfg. Co. has let the contract for a 1-story, 50 x 120-foot plant.

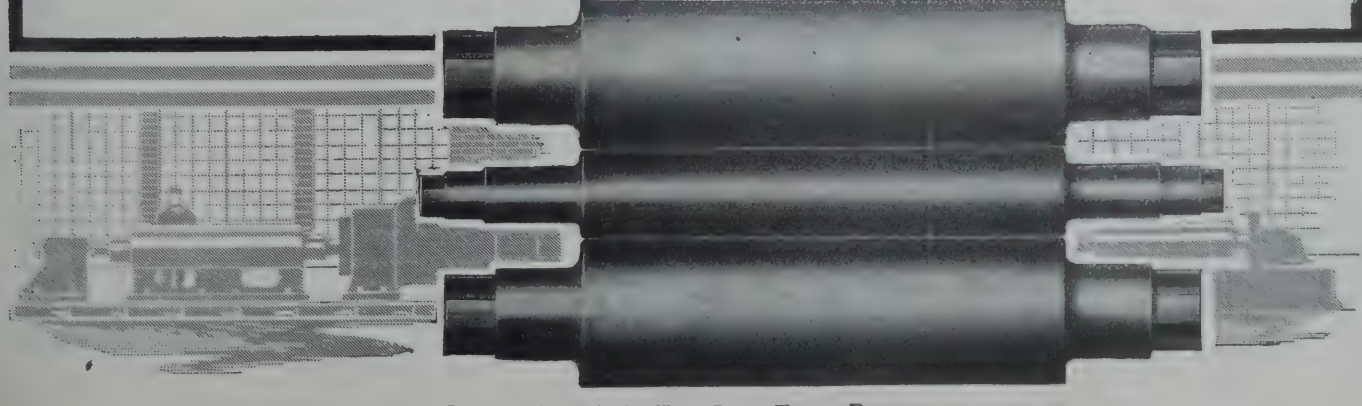
SPRINGFIELD, MASS.—The American Machinery & Equipment Co. has been incorporated with $100,000 capital by Ralph W. Ellis, Percy G. Clemence and Theodore W. Ellis.

WORCESTER, MASS.—The Walden-Worcester, Inc., wrenches, has let the contract to the W. F. Kearns

Say, Fella's—

Just got off that boat I was tellin' y' about. Had some time! Rather roll with Hubbard Rolls than with these boats. Those rolls are steadier and as they're rollin' all the time they get to be a habit.

You'd better get the steady habit that comes with Hubbard Rolls.



So Long,

Rolling Mill Jim.—

Hubbard Steel Foundry Co.

EAST CHICAGO, IND.

All Kinds of Iron and Steel Rolls and Steel Castings.

Say you saw it in THE IRON TRADE REVIEW

Construction Co., Boston, for a 4-story, 60 x 333-foot factory. The contract for a 1-story, 100 x 60-foot hardening building, 40 x 50-foot boiler house and a 40 x 60-foot garage will be let soon.

WORCESTER, MASS.—The Coppus Engineering & Equipment Co. has let the contract to the G. W. Carr Co. for a 56 x 180-foot foundry addition to cost $25,000.

WATERTOWN, MASS.—Revised bids close Sept. 22 for a 100 x 455-foot storehouse for machinery at the United States Arsenal.

BRIDGEPORT, CONN.—Bids have closed for a 2-story, 20 x 150-foot addition to the plant of the Bridgeport Hardware Mfg. Corp.

BRIDGEPORT, CONN.—The Harvey Hubbell Co., manufacturer of electrical specialties, has started on the erection of a 1-story plant addition, 82 x 140 feet, to cost $18,000.

BRISTOL, CONN.—The New Departure Mfg. Co. has taken over the former woolen mill at Meriden, Conn., and has commenced work altering the plant. In addition to this work, the New Departure Co. has plans for further expansion in Bristol.

HARTFORD, CONN.—The Hartford Mill Supply Co. will build a 2-story, 75 x 100-foot store, office and storage building to cost $35,000.

NEW HAVEN, CONN.—The American Radiator Co., Chicago, has let the contract for a 2-story, 100 x 135-foot warehouse to cost $85,000.

WATERBURY, CONN.—The Scovill Mfg. Co. has let the contract for an office building and garage to cost $125,000.

WATERBURY, CONN.—The Manufacturers' Foundry Co. will build a 2-story, 50 x 120-foot foundry, 1-story, 100 x 100-foot storage building and a 1-story, 50 x 50-foot carpenter shop to cost $45,000.

WEST HAVEN, CONN.—Bids art in for a 44 x 100-foot machine shop to cost $30,000 for the New Haven Machine Co.

North Atlantic States

BUFFALO.—The Carter-Hager Electric Corp., electrical construction, has been incorporated with $10,000 capital, by L. E. Carter, P. J. Hager and J. J. Askley Jr.

CARTHAGE, N. Y.—The Northwestern Telephone Corp. will erect a 2-story machine shop at a cost of $20,000.

CLEVELAND, N. Y.—E. Moreness & Co. is having plans prepared for a 2-story plant addition, 30 x 100 feet, to cost $10,000.

JAMESTOWN, N. Y.—The Jamestown Tool & Die Works has awarded a contract for a machine shop, 1-story, 50 x 185 feet, to cost about $30,000.

NEW YORK.—The American Truck Co. will erect a plant at an estimated cost of $1,500,000.

NEW YORK.—The Keister Automatic Mfg. Co. has been incorporated with $500,000 capital, by A. W. Britton, W. R. Randall and P. L. Neiser.

NEW YORK.—The Spank Enameling & Stamping Corp. has been incorporated with $10,000 capital, by B. Skar, E. A. and B. L. Spank, 19 Park place.

NEW YORK.—The Federal Oil Tank & Pump Co. recently was incorporated with $5000 capital, by B. Simon, M. Saller and D. Klein, 1432 University place.

NEW YORK.—The Adelaide Navigating Co. has been incorporated with $100,000 capital, by A. B. Lampke, S. D. Stein and H. V. Williams, 92 Broadway.

NEW YORK.—The Miller Safe & Lock Co. has been organized with $25,000 capital, by H. B. and H. D. Brassington and C. P. Jackson, 319 Canal street.

NEW YORK.—The Wyman Steamship Corp. has been incorporated with $50,000 capital, by V. B. Bendix, R. L. Lake and L. Akerstrom, 561 West 179th street.

NEW YORK.—The Pneumatic Heel Machinery Corp. has been incorporated with $20,000 capital, by T. F. Hardy, W. B. and A. H. O'Relle, 807 West 181st street.

NEW YORK.—The Matthews Lighting Co. of New York, Inc., has been incorporated with $150,000 capital, by J. Speer, W. N. and C. F. Fahell, 706 Riverside Drive.

NEW YORK.—The Dualite Mfg. Co., metal goods, recently was incorporated with $10,000 capital, by E. Holloway, P. L. Woodward and T. H. Wight, 30 Church street.

NEW YORK.—The Universal Body Corp., motors and mechanical appliances, recently was incorporated with $200,000 capital, by W. M. Hall, J. N. Scelba and K. Lorenz, 35 Wall street.

NEW YORK.—The Selective Gas Process Co. has been incorporated with $300,000 capital, by J. B. Wuinlan, J. J. A. Carney and G. W. Colton, 196 Berkeley place, Brooklyn, N. Y.

NEW YORK.—Charles A. Grice & Co. have been organized to manufacture power presses and pumping machinery by Charles A. Grice, John J. Kling and Standish Chard, 45 East Sixty-second street.

ROCHESTER, N. Y.—The North East Electric Co., 348 Whitney street, has awrded contracts for an addition, 76 x 140 feet to cost about $60,000.

ROCHESTER, N. Y.—The Corporation Pattern Works has been organized by George J. Fink, William H. Kramer and others, to manufacture mechanical pattern specialties.

UTICA, N. Y.—The Utica Heater Co., Lafayette street, is having plans prepared for three 1-story plant additions to cost $20,000.

BEAVER FALLS, PA.—The Keystone Driller Co. is having plans prepared for a plant, 2-stories, 40 x 60 feet, to cost about $15,000.

CARBONDALE, PA.—A $60,000 machine shop will be erected her by the Carbondale Machine Co., 80 x 220 feet.

EDGELY, PA.—The William Woodhouse Chain Mfg. Co. has been incorporatel with $25,000 capital. William Woodhouse, Trenton, N. J., heads the company.

ERIE, PA.—The Westcott Valve Co. is having plans prepared for a plant at Seneca Falls, N. Y., to cost $25,000.

PHILADELPHIA.—The Kensington Copper Works has awarded a general contract for an addition, 48 x 100 feet.

PHILADELPHIA.—The Electric Storage Battery Co. has awarded a contract for a $14,000 addition, 32 x 97 feet.

PHILADELPHIA.—Connery & Co., Second and Luzerne streets, manufacturer of boilers, plans a 1-story assembling shop, 75 x 90 feet.

PHILADELPHIA.—The Wirt Co., Arma and Lena streets, electrical specialties, has plans for a new plant, two stories, 62 x 158 feet, to cost $60,000. Charles Wirt is president.

PHILADELPHIA.—The Clearfield Textile Machine Co. recently was incorporated with $100,000 capital by Carl Klenk and others. The company has a plant at 1826 East Clearfield street.

WILKES-BARRE, PA.—The Guaranty Silk Corp. is taking bids for a power house.

YORK, PA.—The York Body Corp. plans a plant, 4-stories, 72 x 106 feet, to cost $35,000.

ATHENIA, N. J.—The Athenia Steel Co. has awarded a contract for a plant extension, 1-story, 100 x 150 feet.

HARRISON, N. J.—The Campbell Foundry Co. plans an additional foundry, 105 x 120 feet. The foundry will be equipped with two cranes of five and ten tons capacity.

HOBOKEN, N. J.—The Front Drive Motor Co. plans a 1-story plant extension.

JERSEY CITY, N. J.—The Drop Forging Co. of New York, 301 Westside avenue, has filed plans for a 2-story addition to cost $37,000.

JERSEY CITY, N. J.—The British-American Rotary Valve Co. has been incorporated with $1,500,000 capital, by Edward Eriksen and others to manufacture valves, etc.

NEWARK, N. J.—The American Transformer Co. will make alterations to its plant.

NEWARK, N. J.—Property has been purchased by the Ellis Motor Car Co. at New and Wilsey streets, for the erection of a plant.

NEWARK, N. J.—The Eastwood Wire Works is having plans drawn for a plant addition, 2-stories, 35 x 45 feet, to cost $15,000.

NEWARK, N. J.—The Advance Metal Stamping Corp. has been incorporated with $25,000 capital, by Samuel Cohen, Joseph Sennabend and Sarah Search.

NEWARK, N. J.—The Transfer Metal Castings Co. has been organized by William Karnatz, 133 Chestnut street, and Joseph Keegan, 85 Somme street.

PAULSBORO, N. J.—The land and buildings of the American Standard Metal Products Co. have been sold to the General Tractors, Inc., which is reported planning to utilize them for the production of tractors. The company was recently incorporated in Delaware with $60,000 capital.

TRENTON, N. J.—The Trenton Malleable Iron Works will take bids shortly for a boiler and power house, 1-story, 40 x 60 feet.

BALTIMORE.—The Baltimore Spring Works, 118-20 Dolphin street, plans a 3-story plant addition.

BALTIMORE.—The Baltimore Water & Electric Co. has awarded contracts for a pumping house, 1-story, to cost about $15,000.

Government Inquiries

BIDS on the following equipment are desired by the navy department, bureau of supplies and accounts:

Two band saws, four chuck columns, two platform and crane scales, miscellaneous cylinder boring and pipe threading machines and two electric welders, 4497, Puget Sound.

Two turret lathes, 4505, Puget Sound.

One power hacksaw, five arbor presses and two cutting cold saws, 4506, Puget Sound.

Four bench drills, one centering machine and three precision lathes, 4507, Puget Sound.

Four radial drills and six drill presses, 4508, Puget Sound.

Two buffing machines and various kinds of grinders, 4509, Puget Sound.

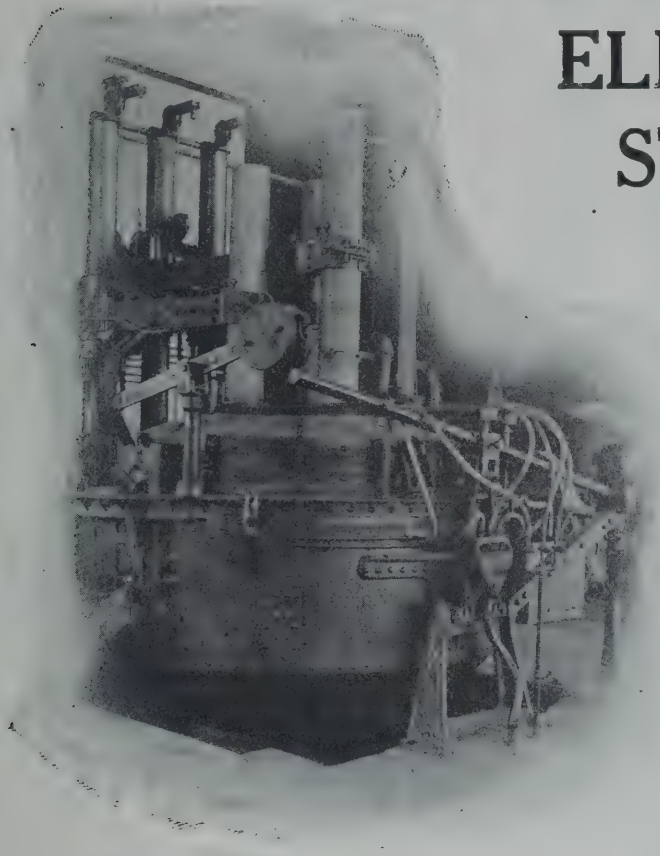
Two grinding machines, 4510, Puget Sound.

Six milling machines, 4519, Puget Sound.

One crank slotter and one cutting machine, 4520, Puget Sound.

Miscellaneous engine lathes, 4521, Puget Sound.

Three planers, two turret lathes and two boring mills, 4522, Puget Sound.



Four crank shapers, 4523, Puget Sound.

Two boring, drilling and milling machines, 4524, Puget Sound.

Schedule numbers, dates of opening and places of delivery follow the specifications of the tools.

FARRELL-CHEEK

ELECTRIC FURNACE STEEL CASTINGS

Every electric furnace steel casting made in our foundry is carefully nursed from the day it enters as an order until it is ready for the final, critical examination. The same master workmen, who made the enviable reputation of the Farrell-Cheek Foundry, are now turning out superior electric furnace steel castings.

MEMBER OF STEEL FOUNDERS' SOCIETY OF AMERICA NEW YORK, U.S.A.

And so it is easy to understand why Farrell-Cheek electric furnace steel castings make good. They ***are*** better. The metal is right to start with, and every operation in the making is scrutinously watched to ensure the maintaining of the high standard which characterizes all Farrell-Cheek Castings.

Your work is completed and delivered quickly. Give this exceptional service your consideration, too.

Write!

FARRELL-CHEEK STEEL FOUNDRY CO.

"Makers of steel castings that are a little better than the next best."

Sandusky, Ohio

F C

Central States Activity

BELOIT, WIS.—The local plant of the Stewart-Warner Speedometer Corp., consisting of brass and iron foundries, machine shop, etc., will be enlarged.

CHILTON, WIS.—The Aluminum Specialty Co., Manitowoc, Wis., has decided to establish a plant here and awarded the contract to the Blake Construction Co., Appleton, Wis., for a 2-story building, 60 x 200 feet.

CUDAHY, WIS.—The Utility Mfg. Co., Squire and Kingham avenues, increased its capital from $25,000 to $125,000. The company manufactures tire machinery and equipment. A. H. Willson is general manager.

EDGERTON, WIS.—The Continental Axle Co. has awarded the general contract fo a 1-story machine shop, 125 x 300 feet.

KENOSHA, WIS.—The Frost Mfg. Co., brass founder, will erect a $25,000 addition to its foundry and build a new office building.

KENOSHA, WIS.—The Arneson Foundry Co., which built a branch foundry a year ago, has decided to make this its main works and will enlarge it by building an addition, 80 x 225 feet, which will cost $35,000. C. H. Arneson is president.

KENOSHA, WIS.—Contracts have been awarded by the Macomber & Whyte Rope Co. for additions which will cost about $150,000. Plans call for the following buildings: Wire mill, rope mill, machine shop, galvanizing plant, blacksmith shop, and office building.

MADISON, WIS.—A new plant will be erected by the Capital City Pattern Works, of which T. Roston is president and manager. Tentative plans call for a 1-story shop, 100 x 300 feet.

MANITOWOC, WIS.—The Aluminum Specialty Co. has awarded a contract for a plant and power house, 1-story, 30 x 40 feet, to cost $40,000.

MILWAUKEE.—The Koehring Machine Co. has let a contract for a plant addition, 1-story, 60 x 117 feet.

MILWAUKEE.—Fire recently damaged the warehouse of the R. J. Schwab & Sons Furnace Co., 280 Reed street, causing a loss estimated at $25,000.

MILWAUKEE.—Bliss Bros. Tool Co., Manufactures Home building, has increased its capital to $25,000. The company makes tools, dies, jigs, etc. W. D. Bliss is manager.

MILWAUKEE.—The Moe-Bridges Co., 60-64 Third street, manufacturing gas and electric fixtures and accessories, increased its capital from $20,000 to $40,000. Charles A. Bridges is secretary.

OSHKOSH, WIS.—The Bull Dog Tractor Co., a new corporation with an authorized capital of $750,000, has elected officers and is negotiating for suitable buildings in which to establish a machine shop and assembling plant.

PORTAGE, WIS.—The Slinger Foundry & Machine Co. contemplates an addition to its machine shop and foundry to cost about $20,000. H. W. Slinger is general manager.

RIPON, WIS.—The Ripon Toy Corp., organized with $150,000 capital as a reorganization of the Kangaroo Toy Co., Chicago, has started work on its new plant, to be 60 x 150 feet. W. R. Keene is general manager.

SHEBOYGAN, WIS.—The Wald Mfg. Co., bicycle, automobile and motorcycle parts and accessories, increased its capital from $30,000 to $90,000 and will build a machine shop addition. Herman Pawsett is secretary and treasurer.

WEST BEND, WIS.—The West Bend Barn Equipment Co. has increased its capital from $50,000 to $125,000 and plans a 2-story addition, 80 x 160 feet. The name of the corporation has been changed to West Bend Equipment Co. The proposed new addition will be used mainly as a machine shop.

ANN ARBOR, MICH.—The Machine Specialty Co. has increased its capital from $10,000 to $135,000 and will erect a new plant. F. E. Royce is sales manager.

BAY CITY, MICH.—The C. R. Wilson Body Co. will build a dry kiln 100 x 325 feet and a storage shed 154 x 200.

BAY CITY, MICH.—The Union Truck Co. has been reorganized with capital of $500,000 and has purchased 15 acres on which a plant 100 x 500 feet will be built.

DETROIT.—The Anderson Electric Car Co. has plans for a plant, 5-stories, 50 x 180 feet.

DETROIT.—The American Blower Co. is having plans prepared for a factory addition and foundry.

DETROIT.—The Production Tool Co. contemplates a machine shop, 1-story, 30 x 80 feet, to cost $20,000.

DETROIT.—The Lancaster Steel Products Co., Lancaster, Pa., will open a Detroit office as well as a local warehouse.

DETROIT.—The Cadillac Motor Car Co. has awarded a contract for a machine shop, 1-story, 50 x 220 feet, to cost $15,000.

DETROIT.—The Parker Rust Proof Co. has let the steel contract for its 2-story factory and office building to the American Bridge Co.

DETROIT.—The Murphy-Shipman Machine & Tool Co. has been incorporated with $10,000 capital, by T. F. Murphy, 841 Howard street, and others.

DETROIT.—The Dorney & Murphy Machine Co. recently was incorporated with $8000 capital, by Charles Dorney, 372 Ferdinand avenue and others.

DETROIT.—The stockholders of the Paige-Detroit Motor Car Co. voted to increase the capital from $3,500,000 to $5,000,000 to care for plant expansion.

DETROIT.—The Powrlok Co., Cleveland, formerly the M. & S. Corp. of Detroit, will establish an assembly plant at Walkerville, Ont. D. C. Nale will be manager.

DETROIT.—The Hudson Motor Car Co., Roy D. Chapin, president, has purchased 48 acres adjoining its plant to permit expansion of the Essex Motor plant, a subsidiary.

DETROIT.—A branch tractor and automobile plant will be established in Mt. Clemens, Mich., by the Henry Ford interests. A $500,000 plant will be erected on the banks of the Clinton river, utilizing water power.

ECOURSE, MICH.—R. A. Murdock, 706 Free Press building, Detroit, is preparing plans for a 150,000-gallon steel tank on tower and two motor-driven centrifugal pumps of 500 gallons per minute capacity for this city.

FLINT, MICH.—The Champion Ignition Co. has appropriated $1,000,000 for plant extensions.

GRAND RAPIDS, MICH.—The Rathbone Mfg. Co. is building a foundry addition 100 x 100 feet. W. G. Renwick is secretary-treasurer.

GREENVILLE, MICH.—The Moore Plow & Implement Co. will build a foundry, 50 x 80 feet. F. P. Allen & Son, Grand Rapids, are engineers.

HIGHLAND PARK, MICH.—The Ford Motor Co. is taking bids for a power plant, 1-story, 265 x 370 feet.

JACKSON, MICH.—Capitalized at $25,000, the Acme Welded Pipe & Coil Co. recently was chartered by Andrew J. Weatherwax and others.

KALAMAZOO, MICH.—The Kalamazoo Spoke & Nipple Co. has been incorporated with $50,000 capital, by M. E. Durkley and others.

KALAMAZOO, MICH.—Kalamazoo will vote in November on a proposal to spend $1,200,000 for the extension of its power and light plant.

LANSING, MICH.—The Hugh Lyons Co. has started on the erection of an addition, 2-stories.

LANSING, MICH.—The Lansing Tool & Stamping Co. will double its capacity. George Conway is general manager.

LANSING, MICH.—The Olds Motor Works is spending $2,000,000 for additions including an axle plant 140 x 750 feet, assembly building addition, 61 x 600 feet, and a sheet metal plant.

MANISTEE, MICH.—The Manistee Drop Forge Co. has been organized to manufacture forged parts for motor cars. Capitalization is $200,000 and P. P. Schnorbach is president.

MARINE CITY, MICH.—The Marine City Iron Works, which just completed new melting capacity, plans other plant additions.

MENOMINEE, MICH.—The Tideman Electric Mfg. Co., Cairo, Ill., has disposed of its original plant here to the Signal Electric Mfg. Co., a new Michigan corporation with an authorized capital of $150,000. Henry Tideman will act as chairman of the board of directors of the new company.

MUSKEGON, MICH.—The Enterprise Brass Works is erecting a 3-story building, to be used as a sand and core room when completed.

MUSKEGON, MICH.—The Maring Wire Corp. has been organized her by Albert Maring and others, to manufacture wire. The company is capitalized at $50,000.

PONTIAC, MICH.—The Oakland Motor Car Co. will erect a 4-story administration building, 54 x 284 feet, to cost $250,000.

ST. JOSEPH, MICH.—The Auto Specialty Mfg. Co. will build four additions costing $100,000 each. Davidson & Weiss, 53 West Jackson boulevard, Chicago, are architects.

TRENTON, MICH.—The Purdy Boat Co., capitalized at $75,000, has purchased a site here and will build boats.

YALE, MICH.—The Currier Machine Shop has been sold to Charles E and William Houser, Port Huron, Mich., who are reported planning to expand the business.

AURORA, ILL.—The Allsteel Equipment Co. is having plans prepared for an addition, 1-story, 80 x 100 feet.

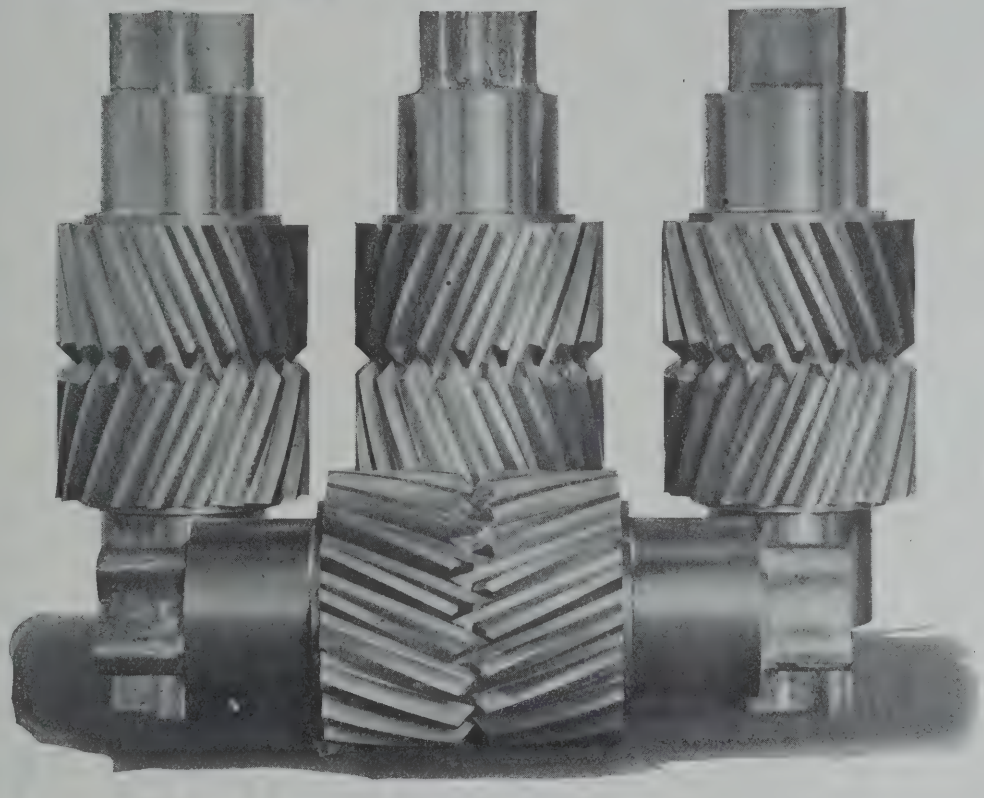
CARBONDALE, ILL.—The contract for a building for the Peroxide Chemical Co. recently was awarded.

CHICAGO.—The Commercial Steel Co. has been incorporated by E. D. Goodrich, M. Leinder and O. E. Lasater.

CHICAGO.—The Grip Nut Co., 122 South Michigan avenue, has taken out a permit to erect a plant, estimated to cost $60,000.

CHICAGO.—The Belden Mfg. Co., Joseph C. Belden president, 2300 South Western avenue, is building a 4-story wire factory, 90 x 114 feet.

CHICAGO.—The Westerlin & Campbell Co., manufacturer of ice making machinery, 26 North Clinton street, plans a plant, 50 x 75 x 125 feet, to cost $50,000.



CHICAGO.—The Hy-Speed Wrench Co., 139 North Clark street, has been incorporated with $40,000 capital, by Israel Lipman, Ray Rhyman and William Frankel.

CHICAGO.—Architect A. V. Caprano, 923 Blue Island avenue, is preparing plans for a plant and boiler house to be built at Michigan City, Ind. The name of the owner is withheld.

DECATUR, ILL.—The Comet Automobile Co. has let a contract for a power plant to cost $22,000.

HERRIN, ILL.—The U. S. Reduction & Atomizing Co. will erect a plant, 40 x 120 feet, 3-stories,

Gears for All Types of Rolling Mill Service

Open Hearth Steel Castings
FALK HERRINGBONE GEARS

Combine high efficiency, great reliability and long wearing quality with low upkeep.

These advantages, and many others can be derived from an installation of Falk Herringbone Gears.

Steel Castings from 1 to 100,000 lbs.

Write for Particulars

The Falk Company Milwaukee, Wis.

REPRESENTATIVES:

PITTSBURGH, W. O. Beyer, 1024 Park Building
SAN FRANCISCO, F. W. Grimwood, Rialto Bldg.
NEW YORK, M. P. Fillingham, 50 Church Street
DENVER, COLO., Denver Engineering Works
WILKES-BARRE, PENNA., Vulcan Iron Works

and a boiler house, 40 x 40 feet, at an estimated cost of $100,000.

MOLINE, ILL.—The Moline Iron Works will erect a foundry at an estimated cost of $250,000.

ROCKFORD, ILL.—The Rock River Tool Co., capitalized at $10,000, has been chartered to manufacture tools by John Jensen, F. W. Trostle and M. B. Trostle.

ANDERSON, IND.—The Anderson Foundry & Machine Works plans two additions, 80 x 100 feet and 80 x 150 feet to cost about $125,000.

EVANSVILLE, IND.—Gilmore M. Haynie & Co., capitalized at $20,000, has been chartered to manufacture power and light plants by Isidore Kahn, M. S. Haynie and Gilmore M. Haynie.

INDIANAPOLIS.—The Equator Mfg. Co., capitalized at $20,000, has been chartered to manufacture tools and machines by A. T. Potter, M. M. Pool and R. E. Berry.

INDIANAPOLIS.—The Dunn Motor Co., capitalized at $50,000, has been chartered to manufacture motors by George H. Rossebo, Henry F. Dunn and Benjamin D. Aufderheide.

INDIANAPOLIS.—J. D. Adams & Co., 317 South Belmont avenue, road building machinery, will build a storage house, 1-story, 162 x 175 feet, at an estimated cost of $60,000.

INDIANAPOLIS.—The Wheeler Automatic Transmission Co. has been organized with $500,000 capital, by George W. Ray and others. The company will manufacture an automatic transmission.

INDIANAPOLIS.—An addition to the plant of J. D. Adams & Co., 317 South Belmont avenue, manufacturers of road building machinery, is being planned. It is estimated the improvements will cost about $100,000.

LEBANON, IND.—Leroy M. Cline and Peter F. Emmert, machinists, have organized a company to manufacture automobile truck cabs and tops and do general machine repair work.

LEGONEIR, IND.—The Legoneir Auto Body Co., capitalized at $135,000, has been chartered to manufacture automobile bodies and accessories by Maurice Loeb, Alexander Weiss and Sigmund Loeb.

MARION, IND.—The Fairmount Drop Forge Co. has perfected an organization and has purchased three acres as a site for a plant. The company was incorporated with $100,000 capital recently.

VINCENNES, IND.—The Vincennes Auto Radiator Co. has been incorporated with $2000 capital, by Leo E. Beck, William H. Duchrane and John N. Fitzgerald.

AKRON, O.—The Akron Electro Plating & Novelty Mfg. Co. has been incorporated with $20,000 capital, by Barnard H. Campbell and others.

BARBERTON, O.—Contractors are erecting an addition, 60 x 260 feet, to the Pittsburgh Valve & Fittings Co.

CINCINNATI.—The American Metal Products Co., 1225 Budd street, is increasing the capacity of its plant. A. L. Holmes is general manager.

CINCINNATI.—The Bahmann Iron Works Co. has taken over the plant of the International Clay Working Machinery Co., and is reported planning extensions.

CLEVELAND.—The Atlantic Foundry Co. is constructing a $100,000 extension.

CLEVELAND.—The Lang Body Co. has plans for a plant, 4-stories, 160 x 263 feet, to cost $150,000.

CLEVELAND.—The Chandler Motor Car Co. has plans for an addition, 3-stories, 80 x 400 feet, to cost $200,000.

CLEVELAND.—The Fixit Body & Fender Repair Co. has awarded contracts for a plant, 62 x 100 feet, to cost $45,000.

CLEVELAND.—The Crescent Brass Mfg. Co., 8410 Lake avenue, plans to rebuild its plant which was recently damaged by fire.

CLEVELAND.—The Ohio Stamping & Engineering Co. has been incorporated with $25,000 capital, by William E. Blackie, David W. Davies and others.

CLEVELAND.—The Cleveland Tractor Co. plans two plant additions to cost $400,000. They will be 1-story, 182 x 440 feet, and 2-stories, 90 x 190 feet.

CLEVELAND.—Plans are being prepared for an assembly building for the Collier Motor Truck Co., care of R. A. Palmer, Bellevue, O. The building will be 1-story, 60 x 400 feet, and will cost $100,000.

CLEVELAND.—Contracts have been awarded by the Vita Mfg. Co., Williamson building, for a plant, 132 x 252 feet, which when completed will be devoted to the manufacture of magnetos and automobile specialties. George D. Rogers is president of the company.

DAYTON, O.—The Dayton Engineering Laboratories Co. contemplates a plant to cost $200,000.

ELYRIA, O.—The Elyria Steel Products Co., which was recently incorporated with $150,000 capital, is making preliminary plans for an automobile body plant to be erected either in this city or Cleveland.

HAMILTON, O.—The Iron City Foundry is reported planning a plant addition.

LIMA, O.—The Universal Knitting Machine Co. recently was incorporated with $300,000 capital, by J. E. Sullivan and others.

LORAIN, O.—Work on a plant for the Lorain Steel Stamping Co., which was recently incorporated, is expected to be started shortly. The company has purchased a site. A. Bregman is general manager.

LOUDONVILLE, O.—The Flexible Side Car Co. has awarded a contract for a plant addition, 1-story, 100 x 100 feet, to cost $60,000.

MARIETTA, O.—The Ohio Valley Foundry Co. has been organized by C. Lanam and others to operate a gray iron foundry.

TOLEDO, O.—Enlargement of the plant of the McCarthy Drill & Tool Corp., Clinton and Oakwood streets, is planned by the Fastfeed Drill & Tool Corp., New York, which has purchased the Toledo plant. The New York company recently was incorporated with $500,000 capital.

LOUISVILLE, KY.—The Labor-Saving Appliance Co. has been incorporated with $10,000 capital, by J. Harry Ives, J. Clifford Lee and Lee Read.

HUNTINGTON, W. VA.—The Electric Unit System Corp. has been incorporated to conduct an electrical business with $50,000 capital, by C. C. Hartzell, E. F. Kincaid, E. L. Smith, H. T. Lovett and H. Blaisdell.

MOUNDSVILLE, W. VA.—The United States Stamping Co. will build a plant to cost $75,000. J. M. Sanders is president.

PENNSBORO, W. VA.—The Pennsboro Drilling Tool Co., capital $75,000, has been incorporated by R. Yeates, C. J. Kerr, C. M. Denning, S. W. Collins and B. F. McGinnis, all of Pennsboro.

WHEELING, W. VA.—The Wilcox Machine Co. is reported contemplating an addition.

WHEELING, W. VA.—The Wheeling Stamping Co. has let the contract for a $30,000 addition.

WHEELING, W. VA.—The Wilcox Machine Co. will build a plant at Shadyside to cost $300,000.

WHEELING, W. VA.—The J. E. Moss Iron Works is reported planning to build a plant, 125 x 250 feet.

WHEELING, W. VA.—The Wheeling Can Co. has bought a plant in South Warwood, and will remodel it for its own use.

WHEELING, W. VA.—The Wheeling Stamping Co. is planning to erect extensions at an estimated cost of $30,000, according to a report.

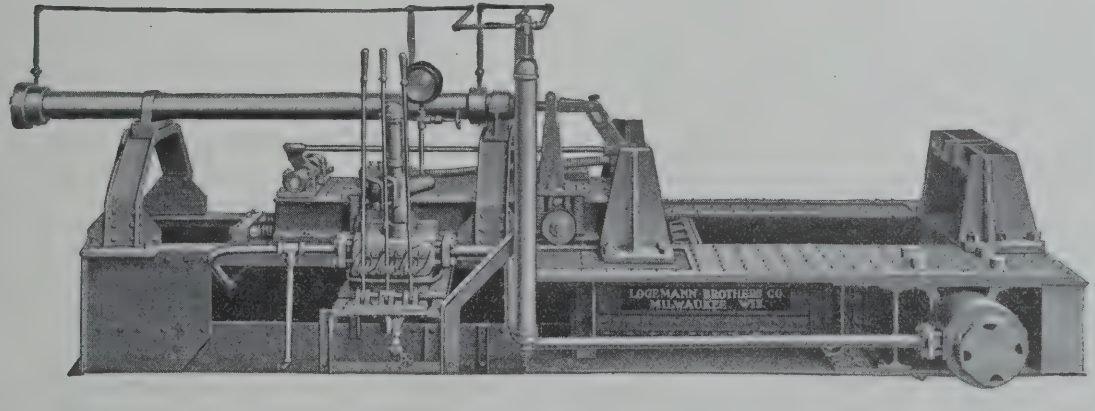
When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

Logemann Brothers Co.

3126 Burleigh Street
Milwaukee, Wis.

Cleveland, Chamber of Commerce; Cincinnati, Chamber of Commerce; Los Angeles, Chamber of Commerce; Philadelphia, Chamber of Commerce; Portland, Oreg., Chamber of Commerce; Dayton, Ohio, Chamber of Commerce; Pittsburgh, Chamber of Commerce

A party in Greece desires to get in communication with exporters with a view to getting an agency for the sale of crude-oil engines, hydraulic presses, agricultural implements, flour-mill and oil-mill engines, steam engines, boilers, motor cars and trucks, mechanical tools, blacksmithing machinery, electrical machinery, etc. Opportunity No. 30454.

A Spanish mining company is planning to increase its production and will erect a new plant, which will involve the purchase of crushing machines, jigs, concentrating tables, fine-grinding machines and equipment for oil flotation. Opportunity No. 30460.

A firm of import merchants in India desires to connect with selling agents of American manufacturers of hardware, mill and railway stores; machinery; electrical supplies, etc. Opportunity No. 30462.

The president of a Spanish mining company is in the United States and desires to purchase mining machinery, gasoline and kerosene engines, electric motors and equipment and agricultural machinery. Opportunity No. 30498.

Business Changes Recently Announced By the Trade

NEW branch offices have been established by the Keller Pneumatic Tool Co., Chicago and Grand Haven, Mich., at Birmingham, Salt Lake City, Utah, and at San Francisco. The former is located in the Jefferson County bank building, under the management of H. I. Kahn. The Salt Lake City office is located in the Newhouse building, under the management of the C. H. Jones Co., and the latter office is in care of Eccles & Smith Co., whose main headquarters are in San Francisco, with branches in Portland and Los Angeles. Complete stocks of pneumatic tools and repair parts will be carried at all branches.

JENIFER blast furnace, at Jenifer, Ala., will be operated as the Jenifer Iron Co. in the future. W. Aubrey Thomas, of Jenifer, is president; John M. Thomas, Milwaukee, vice president, and T. E. Thomas, Niles, O., secretary and treasurer.

* * *

The Sun Machinery Co., 150 Nassau street, New York City, has established show and sales rooms at 278 Washington street, Newark, N. J., with Alvin R. Whitehead in charge as sales manager.

* * *

The Allen Motor Co. has completed the transfer of its factory and offices from Fostoria, O., to Columbus, O.

* * *

The Dace Auto Wheel Equipment Co., Bridgeport, Conn., has changed its name to the Dace Rim Co.

* * *

C. L. Post, vice president of the Condron Co., engineers, Chicago, has opened a branch office in the Central Savings & Trust building, Akron, O.

* * *

The Automatic Furnace Co., Dayton, O., has opened up a branch office at 231 Insurance Exchange building, Chicago, with Alfred J. Saxe in charge.

* * *

The Colonial Supply Co., Pittsburgh, has opened a branch office in Youngstown, O., which is located in the Stambaugh building, with William H. Harris in charge.

* * *

The Chicago Pneumatic Tool Co., Chicago, has removed its Cincinnati office from the Mercantile building to the Walsh building, Pearl and Vine streets, where a service station with a complete stock of its tools and repair parts will be maintained.

* * *

The buyer's office of the Remington Typewriter Co., Inc., was removed Sept. 1, from Syracuse, N. Y., to Ilion, N. Y. L. Rayburn is buyer for the company's factories at Syracuse and Ilion, N. Y., and Bridgeport, Conn.

* * *

The Pennsylvania Iron & Steel Products Co., Ellwood City, Pa., has established a sales office in the Oliver building, Pittsburgh, in charge of R. L. Mason as general agent.

* * *

The Bridgeport Electric Products Co., Bridgeport, Conn., has changed its name to the Liddell Electric Mfg. Co.

* * *

All offices of the United States Chain & Forge Co. now are located on the second floor of the Union Arcade building, Pittsburgh. Previously some of the offices were on the third floor of that building.

* * *

Luria Bros. & Co., Reading, Pa., scrap iron brokers, with branch offices at New York and Pittsburgh, have opened an office in the Board of Trade building, Boston.

* * *

The Nortmann-Duffke Co., Milwaukee, is the new corporate style of the former Nortmann-Duffke Foundry Co.

* * *

The Central Steel Co., Massillon, O., has removed its Detroit district sales office into new quarters at 1053 to 1055 Book building, 35 Washington boulevard, Detroit.

* * *

Representing Heller Bros. Co., Newark, N. J., high grade tool steel and files, B. C. Heacock has removed his offices to 206 Columbia building, Cleveland. This agency formerly was conducted by Norcross & Heacock.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, September 18, 1919 *No. 12*

Industry Calmly Awaits Events

Pending Strike Developments Have Small Effect on Trade Situation—Mills Sold up to Year End in Many Lines—Larger Independent Allotment of Steel is Sought for Export—Heavy Materials Are Improving

WHETHER the strike call of the radical union element against the steel industry is withdrawn, or not, apparently remains a matter of no great consequence to either producers or consumers. Both are taking the situation with the same calmness and lack of anxiety that have marked their attitude from the beginning. In reality the opinion is held in many responsible quarters that an attempt of the newly-recruited unions to dictate forcibly their program would be attended by a salutary and clarifying effect upon the unsettled labor situation of the whole country. It has been shown that the great bulk of the organized faction has been enrolled among the foreign and more ignorant classes. The American-born and skilled workmen as a rule have refused to joint in the movement and has been making a growing protest against interference with their conditions of employment. The trade situation in iron and steel continues highly favorable with production for the most part still on the upward curve.

Orders Are Declined

While new buying in those products which have been most active is not so vigorous on the whole, it is chiefly because it cannot be accommodated before an extended date. There is a liberal bidding for new tonnage by buyers but much of it is being declined by the mills. Specifications have been flowing in upon producers so heavily that very little free mill space remains up to Jan. 1 in steel bars, sheets, wire products, tin plate and lapweld tubes. Buyers are beginning to seek mill positions for 1920.

Heavy lines in which the demand has been lightest are improving but in an erratic way. The price softness in plates continues, attractive orders readily bringing out 2.50c Pittsburgh. Both the Carnegie Steel Co. and the Jones & Laughlin Steel Co. quoted to the navy this week 2.50c on plates and 2.40c on shapes on 5500 tons of material. Shipwork continues to develop. New lake contracts virtually closed call for a heavy tonnage of steel.

A continued expansion of new construction is shown by the 78½ per cent of fabricated steel capacity which was booked in August representing about 141,000 tons, a gain of about 7800 tons over July. With two exceptions the record is the best since December, 1916. Despite current reports, the railroad administration is yet to award the 100,000 tons of rails upon which bids recently were taken.

Ask Increase for Export

Growing prospects and sales abroad are denoted by the effort of the export agency of independent mills, to obtain an increased allotment of foreign tonnage from its principals. At present 10 per cent of the output of the associated plants is set aside for this purpose, this representing about 80,000 tons monthly. It is a question whether this additional tonnage can be spared because of the pressure of domestic demand. France has placed 6000 tons of ship plates in the east. A Belgian inquiry for 10,000 freight cars now pending will call for about 80,000 tons. An interesting purchase by Italy calls for the unassembled material for a 5500-ton fabricated ship. A 15,000-ton sale of plates to Japan is reported. Brazil has inquired for 15,000 tons of rails and an inquiry for 6000 tons of light rails is current from Europe.

In this connection, further light is shed upon the outlook for French competition in the foreign field by the exhaustive report of the official British inquiry into the new steel conditions of Europe, copies of which have reached this country. It is declared such competition is not to be expected until the destroyed works have been reconstructed and put in full operation, three to five years hence.

Iron Stocks Dwindle

Pig iron stocks with merchant furnaces have been dwindling steadily and now represent in total less than a month's shipments or production. August was the third successive month to show an excess of deliveries over output. The aggregate decline of furnace stocks since June 1, is estimated at about 150,000 tons. A further round increase in total orders was netted in August. The effect of this condition is a growing scarcity of foundry iron for this year. Sellers are having little trouble to get 50 cents to $1 a ton advance where they ask it and can deliver. Alabama No. 2 has been sold at $27.50 and $27.75 furnace.

The Real Immigration Problem

FROM all that has been said during the past few months in regard to "the immigration problem" it is apparent that there is no such problem, except as some congressmen at the behest of a radical labor constituency are attempting to create one. There is no occasion for alarm in regard to the number of aliens departing from the United States, nor yet regarding the number of European workmen who may come to this country. But there is reason to fear that congress may suspend all immigration for a number of years, and thus bring about a more serious situation in this country than any which it may hope to improve.

Last spring the American Federation of Labor adopted as one of the features of its labor program for congress' consideration the suspension of immigration for five years. The federation at that time had no difficulty in finding congressmen to propose such a measure. Industry was not in such a favorable position as it is today; while there was some unemployment, the United States employment bureau exaggerated the state of affairs. It became an easy matter for congressmen to say that they would exclude all aliens for a number of years "to protect the American workingmen." Such a statement fitted in with the popular misconception that there was an oversupply of labor.

It was plausible enough at the time, but conditions have changed since then. The shortage of labor in the United States today is increasing steadily and threatens to become serious, and yet the bills to suspend immigration are still urged as a means of keeping alien workmen out of our "overcrowded labor market." Conditions which the sponsors of the bills said dictated the suspension of immigration have been reversed; there is a shortage of between 5,000,000 and 10,000,000 workmen in the United States; but regardless of that fact the friends of the federation insist that the supply be limited still further. The fact is that the measures were introduced not so much for the purpose of protecting the great body of American workingmen, 37,000,000 independent workers, but to give the American Federation of Labor a club with which to hold up employers for the benefit of 3,000,000 union men. The real danger lies in the fact that the suspension of immigration may force the suspension, or at least make impossible the extension of some of the country's industries.

There is no difference of opinion in regard to the exclusion of the mentally and physically unfit, and there should be none in regard to the admission of able-bodied, clean-minded men of Europe who might seek to make their homes in the United States.

In regard to the estimates of the number of aliens who are preparing to leave the United States it is significant that in no single year has the outgoing number exceeded the incoming; in other words, the balance at the end of the fiscal year has always been in favor of this country. Monthly returns have shown losses for such periods, but even during the war a net gain was shown each year. The net loss of some 15,000 in the first six months of this year probably may be offset by gains during the remainder of the year. The large amounts of money the aliens are reported to be taking from this country may aid toward improving the exchange situation, but does not represent a serious loss. Presently we may expect to see a majority of them back in this country. The high cost of living here may not seem so high after all when they have been called on to pay the war debts of their fatherlands, and no doubt many of them will be quick to reflect that they left liberal wages and comfortable living conditions back in the United States.

James Watt, His Work

DURING the latter part of the eighteenth century a crude type of steam pump was employed in the northeastern part of England to drain water from the coal mines. This clumsy apparatus consisted of a boiler, in which steam at a pressure

only slightly exceeding that of the atmosphere was generated, and an engine whose principal parts were a vertical cylinder, a piston and a counter-weighted beam. When the low pressure steam was admitted to the cylinder, the piston, aided by the counter-weight on the beam, was forced upward. The steam was then shut off and a jet of cold water was introduced into the cylinder to condense the steam. This reduced the pressure and allowed the atmospheric pressure to force the piston down to its original position. The water was drained from the cylinder into a well.

This engine, invented and improved by Thomas Newcomen, represented the most advanced development of the time. In 1764, James Watt, mathematical instrument maker of the University of Glasgow, attempted to repair one of these engines in the university laboratory. He became interested in the problem of reducing the consumption of fuel and water, and as a result of extensive tests he conceived the idea of condensing the steam in a separate vessel, thus avoiding the wasteful practice of alternately heating and cooling the cylinder. This was Watt's most important invention. Later he placed heads on both ends of the cylinder, introduced a steam jacket in the cylinder walls, suggested five methods of converting the reciprocating motion of a piston into rotary motion, built the first double-acting engine, introduced the cut-off admission valve and invented the well known parallel motion, the throttle valve, centrifugal governor and the indicator.

When the Scottish engineer commenced his remarkable work, he found the Newcomen engine, which consumed from 20 to 30 pounds of coal per horsepower hour. A score of years later, as a result of Watt's improvement, engines using only 6 pounds of coal per horsepower hour were in operation. In the century following the death of Watt the world has witnessed the introduction of high pressure steam, the development of compound engines and steam turbines, and the extensive use of superheated steam. However, the entire effort directed toward fuel economy since the days of Watt has resulted in reducing the pounds of coal per horsepower hour from 6 to 1¼ pounds, less than one-fourth of the reduction effected by Watt. The reduction is much less, if the typical modern engine of small rating is compared with Watt's engine. Moreover, there are a great number of pumps and engines in operation today whose performance shows far less economy than obtained by the Scottish engineer more than a century ago.

In observing the centennial of the death of James Watt, the engineers assembled at Birmingham do honor to one of the foremost contributors to modern industry. The new emphasis, bound to be given to the importance of his work by the centenary, is especially desirable in these days when economy, so urgently needed, is rarely achieved.

Coke Supply, France's Big Problem

NOTWITHSTANDING her tremendously increased resources of iron ore and her possession of numerous former German works in Lorraine, in addition to her own plants as a nucleus for a great industry, France has one vital problem which she must solve before she can take her place among the leading iron and steel powers of the world. This is the providing of an adequate and dependable source of coke or coking coal supply. Under present conditions the menace of Germany still is cast over the French industry, because the latter largely is dependent upon Westphalian coal for its furnace coke. What reliance may be placed upon this source for sustained supplies is significantly shown by the failure of the German government to fulfill its obligations under the armistice to deliver to France a certain tonnage of furnace coke daily.

This unstable position of France with regard to coke supply is one of the most striking of the many important conclusions contained in the report of the British commission appointed to examine the conditions of the iron and steel works in Lorraine in the occupied areas in Germany, in Belgium and in France, a copy of which has reached this country and has been digested in this issue. As a result of this fuel situation, a trade arrangement whereby France will furnish Great Britain basic pig iron in exchange for coking coal is emphasized as more than a strong possibility.

The report of the British commission is the most comprehensive and complete in detail of any study that yet has been made of the iron and steel conditions in continental Europe as altered by the results of the war. It describes the conditions of the works as they were found at the time of inspection, the progress of reconstruction and of extensions carried on by the Germans during the war and reveals many facts which heretofore had been veiled by the secrecy of war. None of these is more interesting than the account of Germany's unsuccessful efforts to cope with her shortage of ferromanganese which had been forced upon her by the blockade of her ports. She made many ingenious efforts to overcome this obstacle but the results as gaged from sound steel practice, were a failure.

Because of its exhaustive thoroughness and its wealth of detail the report of the British commission is one of the notable contributions that yet has been made on the subject of the recast steel boundaries of Europe and the future. The fact that the inquiry was made by eminent British steel masters greatly adds to its practical weight and importance.

Iron and Steel Prices

Early Foundry Iron Grows Scarce

Makers Find Little Trouble in Getting Advances When They Ask it—Alabama Makers Sell at $27.50 and $27.75 for No. 2—1920 Buying Still Held Back—Stocks Recede Rapidly

Cleveland, Sept. 16.—Increasing difficulty of buyers to get foundry iron for this year is evidenced by the growing sales of furnaces outside their ordinary geographical zones. Local stacks have been making various sales at distant points and at $27.75 for 2.25 to 2.75 silicon. In some cases Cleveland furnaces have sold at $27.75 for 2.25 to 2.75 silicon. This situation apparently is produced by the sold-up condition of many stacks. In fact some furnaces who have been selling right along, are being obliged to decline some orders. A valley furnace which recently blew in on foundry iron has withdrawn after booking a liberal tonnage for this year on the $26.75 basis. Sales for 1920 still are avoided by most producers in lake and valley territory, although one interest which has been accepting tonnage for next year from its regular trade booked about 5000 tons more for that period in the week. This business was done at the $26.75, furnace base, the same as the large tonnage which previously had been entered for next year by this producer. A fair amount of inquiry is current, much of which is for next year. The Westinghouse interests are in the market for several thousand tons of foundry iron for eastern plants. A 4000-ton inquiry for a western Pennsylvania consumer is out. There are no developments in steelmaking iron. Shipments continue heavy and furnace stocks are shrinking steadily.

Ask for Premium on 1920 Iron

Boston, Sept. 15.—The outstanding feature in the pig iron market here at present is the apparently unrestricted offer of 1920 iron at $29, furnace, for 2X eastern (2.25 to 2.75 silicon) by a Buffalo producer. Few other furnaces are offering any 1920 iron and they are holding out for a premium of approximately $1 above the price for this year. No sales of any importance have been made here during the week and the aggregate is made up of small tonnages. The few representatives who have 1920 iron to offer report a quiet condition with no sales above 300 tons. One small furnace in eastern Pennsylvania is offering 1920 iron and several small sales to eastern Massachusetts consumers have been reported for first quarter at $32, furnace, for No. 2X. Sales for this year from the Buffalo district have been made at $29 for No. 2X. Indications point to the placing of some large business for next year's requirements in the near future. The Draper Corp., Holyoke, Mass., is said to be considering a large purchase. A Boston foundry bought 300 tons of No. 2X for last quarter at $30, eastern Pennsylvania furnace. Several eastern Massachusetts consumers placed orders ranging from 100 to 300 tons of 2X eastern for first half delivery at $29, Buffalo furnace. Eight or nine Connecticut consumers placed orders for small tonnages of 2.25 to 2.75 silicon for this year. Virginia furnaces still are selling only in special cases, and in small lots, and nothing for 1920 has been reported in New England.

Foundry Grades in Demand

New York, Sept. 16.—Foundry grades continue to be popular in this market for such sales as are being made by pig iron producers. But such furnaces as care to sell at this time are taking on only small tonnages, which in the aggregate, however make up a fair total. A large seller in this market has taken on 10,000 tons in the week upon which full prices have been paid. This aggregate was divided about equally between iron for delivery this year and early next year. A couple of hundred tons of No. 2X, (2.25 to 2.75 silicon) have gone at $30, eastern Pennsylvania furnace. Iron is not being pressed upon the market from any producing district, a fact which shows stacks are comfortably filled with business especially for this year's delivery. Gray iron foundries in the metropolitan district, including northern New Jersey and eastern New York, are becoming busier and are taking additional small tonnages of iron. Still, some of them find a scarcity of molders which is tending to keep down the melt somewhat since they have orders that would keep them fairly well occupied. Virginia furnaces are still selling small lots of higher silicon iron in this district and are getting $32 and upward at the furnace in some instances, which quotation in other instances shows the furnaces are virtually out of the market. Low phosphorus and basic grades are quiet while charcoal producers are so well sold they have been practically out of the market for this year's delivery.

Maneuvering for Position

Philadelphia, Sept. 16.—Maneuvering for position in the future pig iron market, both buyers and sellers are observing each others movements circumspectly. Each side frankly admits the other has reason for its position and both are studying market conditions with care. Buying is being done on limited scale and in most

cases grades involved are foundry. General quotation in Philadelphia market for No. 2X (2.25 to 2.75 silicon) is $31 delivered, although one seller with more favorable freight rate is said to have quoted the equivalent of $30. Buffalo iron appears to be keeping out of the Philadelphia market and Virginia furnaces are not trying to push metal either, as high quotations of the leading producer in that territory would indicate. The most interesting inquiry out today calls for 1000 tons of low phosphorus, high manganese iron put out by Pennsylvania railroad for this year at Altoona shops. Confirmation is found in east of declaration by Lake Superior charcoal iron producers that they are sold up for sales agents at Philadelphia report failure to receive a single quotation on even as small lots as 200 tons wanted for this year, and upon which the price was a consideration secondary to delivery. Not one inquiry for basic iron is out in this market and bessemer is just as quiet, while neither of them appear to have anything on low phosphorus in absence of activity. Consumers of the latter grade still are absorbing wartime allocations, whenever they can, and this phase of the market is clearing up slowly but steadily.

Chief Interest in Foundry Iron

Pittsburgh, Sept. 16.—Considerable paucity still marks the demand for pig iron in this market and with the exception of foundry grades and possibly off grades of irons of special analyses, trading has been entirely in lots of one and two carloads. One house reports sales aggregating more than 1800 tons made up of numerous small lots. The National Transit Co., Oil City, Pa., has put out an inquiry for its foundry requirements for the last quarter which reached a maximum of 3800 tons. The Westinghouse Machine Co. is looking for 1500 tons of foundry for last quarter delivery and also would place its requirements for the first quarter of next year. One interest here quoted 28.75, furnace, for 2.25 to 2.75 silicon for shipment next year, more for the purpose of discouraging the purchase. Merchant blast furnaces still are fighting shy of commitments for 1920 for they have no way of determining the conditions that will exist by the time production against such business begins. Premiums of 25 to 50 cents a ton and occasionally a little more, are being obtained on small tonnages of foundry iron for prompt shipment. In the steelmaking grades the market is as dull as it has been at any time this year and while prices nominally are holding around $25.75, furnace, for basic, they can hardly be said to be firm as the business has been solely of small lots for immediate shipment and provides no real test of the market. A Pittsburgh district steel manufacturer is understood to have bought his requirements of basic for this month, amounting to between 2000 and 3000 tons, at 50 cents a ton below the regular base price. Significant of the fact that the situation is much more favorable in foundry than in steelmaking iron is a report that when the Ella furnace, West Middlesex, Pa., operated by E. W. Mudge & Co., Pittsburgh, is lighted it will go on foundry instead of basic and bessemer ordinarily produced at this furnace. Little is going on in low phosphorus iron.

Marked activity is observed in the demand for silveries from the automobile companies who seemingly have been obliged to make new purchases because of their failure to secure shipments against contracts they placed some time ago, due to the suspension of the Jackson county, O., furnaces on account of labor troubles. Shipments of silveries are reported to be moving forward from these furnaces but not so freely as buyers could desire. Most business reported through this market has been at a basis of $40.25, furnace, for 8 per cent. Higher prices than this are reported from outside markets, but a Pittsburgh interest making silveries still is far from being booked up at the lower figure.

Take 1920 Business at Advance

Buffalo, Sept. 15.—An increase in the foundry melt is shown by the enlarged demand for pig iron, and the entering of specifications against shipment. Furnaces are more inclined to quote on 1920 business, and some iron has been contracted for in small tonnages at an increased price. Such business, however, is small as furnace interests are cautious pending labor developments.

1920 Buying Increases

Chicago, Sept. 16.—While demand for pig iron for use during 1919 has fallen off to a negligible quantity, increased inquiry is being received for 1920 delivery about equally divided between malleable and foundry grades. This demand is coming principally from larger users and is not a general demand, nor does it seem likely to grow into a general buying movement for some time. Inquiries at present range from 500 to 5000 tons each. Already considerable tonnage has been sold in this market for next year. The principal seller is quoting $26.75, furnace, for No. 2 foundry (1.75 to 2.25 silicon), but for silicon grades above 2.25, $1 is being added to the usual differentials. It is understood an Ohio furnace recently selling silveries has booked all the tonnage it needs and has retired from the market for the present. An important southern interest has sold some small tonnages in the north recently at $28, furnace, for 1.75 to 2.25 silicon, with an increase of 4 per cent for each successive step in silicon content, making 2.25 to 2.75 silicon $29.50, furnace, and 2.75 to 3.25 silicon $30.25, furnace. Another southern producer which has no No. 2 foundry for delivery this year is selling some higher silicon on a basis of $28.50, furnace, for 1.75 to 2.25 silicon. Aside from bookings of 1920 iron as previously mentioned, the market is dull.

Buying in South is Light

Cincinnati, Sept. 15.—Southern furnaces are not yet willing to take on any business for next year. There is still some No. 2 foundry iron as well as odd lots of off metal to be had in the South for last quarter shipment, but during the past few days buyers have made few additional purchases, even though some of them will need extra iron to carry them through the year. Inquiry is exceedingly light, and sales equally limited. Southern Ohio furnaces are now practically out of the market for either first quarter or first half and the only business previously booked by them included a few medium tonnages taken at $28.75, Ironton. It is currently reported that one of the lake producers is still willing to accept some 1920 business from old customers at $26.75, furnace. The silvery iron situation is unchanged and all the Jackson county, O., furnaces are still idle. The minimum quotation on Virginia foundry iron (1.75 to 2.25 silicon) is now $30, furnace, but little iron is to be had in that territory for this year's shipment.

Small Lots Sold at St. Louis

St. Louis, Sept. 13.—Business in small lots of pig iron continues brisk, but there is a notable absence of large orders, either for foundry grades or steelmaking irons. The character of the buying, however, indicates an extremely healthy condition among consumers, and the outlook for the winter is considered good. Several selling agencies report much difficulty in procuring supplies for their customers. Authority to sell at certain figures is given, but if orders materialize is any volume, the authority is revoked, and a higher price quoted. This served to terminate what promised to be a fair buying movement earlier this month. Virtually nothing is being sold into 1920, and very little for the last quarter of this year. The great bulk of current transactions are for spot delivery, or shipment through September and October. Prices on all grades are strong. There has been no improvement in the demand for basic. Deliveries are far from satisfactory, due to the freight car shortage, and producers and their agents are being urged to hurry forward material on contracts.

Prices Up, Sales Exceed Output

Birmingham, Ala., Sept. 16.—Pig iron sales in the South every week aggregate more than twice the tonnage produced. Consumers are asking for delivery just as quickly as possible. The car shortage has caused delays and purchasers are apprehensive. Production improved slightly this week, the month's output will show a fair increase.

Prices continue to strengthen and an increasing number of sales have been made at $27.50 and $27.75, furnace, for 1.75 to 2.25 silicon for this year's delivery. One sale of more than 1000 tons at the lower figure was made. One leading Alabama producer has adopted a new schedule of silicon differentials, adding 4 per cent to the price for each one-half of one per cent of silicon above 2.25. This is slightly less than the percentage of increase in the government schedule.

John P. Brennan Dies

John P. Brennan, aged 62, dean of coke operators of the Connellsville, Pa., regions, died suddenly on the morning of Sept. 16, at his home

in Scottdale, Pa. Death was due to asthma which resulted from hay fever. It was thought that Mr. Brennan virtually had recovered from the attack and the preceding night had spent several hours on the front porch of his home. During the night he suffered a relapse and the end came quickly. Last May, Mr. Brennan retired from active business life, after a career of over 40 years, when the Hillman interests assumed control of the Thompson-Connellsville Coke Co., of which he had been president since its organization in 1906. He remained a heavy stockholder and retained his position as president of the Producers' Coke Co.; vice president of the Connellsville-Central Coke Co., and director of all three companies.

Ore Shipments

Now Handicapped by Car Shortage—New Tax May Foreshadow Raise

Cleveland, Sept. 12.—The sale of 15,000 tons of ore to one furnace interest is the only new development in the iron ore market. The company making this sale received another inquiry for a comparatively small tonnage, but the order has not been placed. The market continues quiet, and ore companies report they do not expect much new business to develop during the remainder of the season. Their chief activity now is toward getting the ore down in time to fulfill contract requirements.

The movement of ore is handicapped by a shortage of cars to convey it to the docks. So acute is this shortage that at a number of mines the operation of steam shovels has been suspended. The strike of workmen on the coal docks at Duluth has been called off, but a number of boats are still waiting to be unloaded, and more coal is needed at the mines.

A report to one of the ore companies received in Cleveland Sept. 12 was to the effect that the house of the Minnesota legislature has passed a bill placing a 10 per cent tonnage tax on ore shipments. The state voted to give its returned soldiers $15,000,000 extra pay for the time they were in service, and as the state's finances were in poor shape the Nonpartisan league immediately renewed its efforts to have a tonnage tax placed on ore. A special session of the legislature was called to vote additional sums for the soldiers, and the advocates of the tonnage tax bill forced it through the house before the ore companies knew what transpired. The legislature is to be in session but 10 days and it is hoped to defeat the bill in the senate.

As last season's shipment of ore from Minnesota approximated 45,000,000 tons, the proposed tax would amount to $4,500,000. Ore companies having mines in that state say that if this additional tax is placed it may result in increasing prices next year. They point to the fact that since 1916 the average selling price of ore has increased but $2 while the operating cost has exceeded that figure.

There has been some demand this season for low phosphorus ores, and furnace interests are now paying a premium of about 50 cents a ton to obtain this grade, the net price being $7 a ton.

Coke Market Still is Easy

Spot Demand for Furnace Grade is Light, Standard 48-Hour Fuel Selling at $4.75, Ovens—Foundry Coke Active, Price Averaging $6.25

Pittsburgh, Sept. 16.—Spot demand for furnace coke has been as light recently as it was a fortnight ago, and the softness in prices which began to develop a week ago still exists. Buyers have not specified fully against their contracts and there is not only that surplus for open market sale, but also some additional production which has resulted from the fact that embargoes against eastern shipments have produced a somewhat easier market in coal. While much of the current business in standard 48-hour fuel still is at $4.75, ovens, it is believed that a firm bid a little below that price would not go a begging. No gains are noted in the list of active blast furnaces and a large independent steel company, which for several weeks has been a rather free buyer of spot coke now is producing all of its requirements, and has withdrawn from the market. It is reported that two or three contracts are under negotiation for the remainder of the year, but they are not expected to be closed until all doubts about the labor situation are cleared up. It is said that $5.50 is the minimum on contracts to run over the remainder of the year. The demand for foundry coke still is brisk and producers are having little or no trouble making sales in open top cars at $6.25, while occasionally they are getting $6.50. No bases in sales exists for a price lower than $6, ovens, for 72-hour coke. Production of this grade is being kept well within the limits of contract obligations. Connellsville production of coke for the week ended Sept. 6 is estimated by *The Connellsville Courier* to have been 263,742 tons as compared with 242,395 tons in the previous week.

Strong Demand at Boston

Boston, Sept. 15.—Demand for coke for the balance of the year has continued strong and despite the advance for next year considerable business is being placed for that delivery. The local producer has adopted the flat price of $11.90 to cover first quarter and first half contracts, and it is understood that even at that figure the producer is reluctant to sign up any large volume of business. The coal situation has eased up, and with a strong demand for spot deliveries, and with good prices obtaining, the by-product coke companies are content to let the 1920 situation develop naturally.

Incline to Higher Prices

New York, Sept. 16.—Sellers of foundry coke have stiffened in their ideas of price within the past week, and whereas some had been talking $6, Connellsville ovens, in the past week, now reports of some likelihood of a $6.50, ovens, are heard. Sales of small tonnages at $6 are reported, however, all for delivery this year. Most consumers appear interested in this year's coke, and sellers are encouraging them to confine their interest to that delivery, at least until the labor situation grows clearer.

Cincinnati Market Grows Stronger

Cincinnati, Sept. 15.—Connellsville furnace and foundry grades continue to gain strength and current quotations on furnace coke range from $4.00 to $4.25, and higher. It is estimated that fully two-thirds of the Connellsville producers are asking $6.50 per ton, oven, for foundry coke for either prompt or future shipment, although some brands are still available as low as $6.00. Wise County and Pocahontas foundry grades are around $8.00, ovens, but none can be had in the last named field. New River is quoted at $9.00 to $9.50, but both furnace and foundry are almost unobtainable.

Car Shortage Increases Demand

St. Louis, Sept. 13.—Demand for coke in this district is considerably in excess of supply, due to the shortage of freight cars. Dealers are beset with demands for spot coke because of slow deliveries on regular contracts. Several foundries, which are working at capacity may have to slow down because of their inability to secure coke. Eastern oven interests report that it is virtually impossible to get equipment of any sort, and box cars are about as scarce as at any time in the history of the industry. Appeals to state, regional and national railroad officials have proved futile. Some contracting for the first quarter of 1920 is reported, but ovens are uncertain as to future costs, and will not sell too far into the future.

Southern Prices Firm

Birmingham, Ala., Sept. 16.—Coke producers are receiving inquiries daily, but are selling cautiously. All independent companies have sold fairly well ahead and the pig iron producers need most of the coke they can manufacture. Labor shortage and other difficulties are delaying construction of by-product coke ovens.

Cleveland-Cliffs Takes Over More Mines

Recent reports that the Cleveland-Cliffs Iron Co. has taken over several of the Great Northern ore properties in Minnesota are now confirmed by the company. The properties taken over include the Bourne, Trumbull, North Star, Bingham and Hill mines. They will produce grades of ores which will round out the company's assortment of old range ores produced from the Marquette range for the past 60 years. Several steel companies are associated with the Cleveland-Cliffs Iron Co., in the ownership and operation of these mines, and the operating company will be called the Mesaba-Cliffs Iron Mining Co.

Scrap Market is Waiting

Buyers Watch Developments in Strike Situation—Prices Irregular in Various Districts—Government Sales and Offerings Heavy

FOR COMPLETE SCRAP PRICES SEE PAGE 802

Chicago, Sept. 16.—Although the possible postponement of the date of a general strike call of steel workers has given the market a better feeling, because of the growing idea that the threat largely is a bluff, the possibility of trouble is holding the scrap iron and steel market at a decidedly lower level than otherwise would be the case. Consumers as a rule are taking comparatively little scrap and prices are barely holding their own, with occasional small declines. In spite of this condition dealers believe the market is intrinsically strong and are not willing to part with their accumulations. A dealer who recently sounded out the market for shell steel found an unusually receptive condition and disposed of 5000 tons in one lot to an eastern consumer and has several live prospects in addition. Railroad tonnages continue to be small. The Northern Pacific offers 725 tons, the Chicago, Burlington & Quincy 3500 tons, the Chicago, St. Paul, Minneapolis & Omaha 400 tons, the Chicago Great Western 300 tons, the Kansas City Terminal five carloads and the Michigan Central has issued an open list.

Boston Market Unsteady

Boston, Sept. 15.—Despite activity among foundries, the scrap, iron and steel market has been unsteady during the past week. Local demand for some grades has been strong, but the absence of the normal buying by the steelmakers has been felt on all sides. Heavy melting steel has sold as low as $15 to dealers, although $16 has been paid in some cases. A Worcester consumer of this grade purchased a moderate tonnage at $18.50, delivered. Several sales of from 50 to 200 tons of No. 1 machinery have been reported at about $28, delivered. One eastern Massachusetts consumer offered $28.75, and a sale is believed to have been made at this figure. Government scrap has again been sold during the past week by the Boston district ordnance office. However, the government refused to sell several lots at prices offered. The American Metal Co., Philadelphia, was high bidder on 130 tons of 1 7/16-inch screw stock, at South Boston, at $33.40 per ton, but no award was made. The Cape Anne Tool Co., Pigeon Cove, Mass., was awarded 23 tons of special chrome nickel steel at its own plant at $50 per net ton. The United States navy yard, Boston, awarded several lots of scrap. Fifty tons of turnings were sold for $10.80, at the yard. Steamship plate scrap, tubes and structural scrap was sold to Boston dealers at prices practically uniform with the established market. Malleable scrap has been in demand. A Boston manufacturer bought 50 tons at $21, delivered. A small tonnage was also sold to a Connecticut consumer at the same price.

Supplies Plentiful, Market Quiet

New York, Sept. 15.—Although some dealers report fair activity, the local scrap market as a whole remains quiet. Cast scrap appears in best demand, but even in this material the movement is relatively small. Supplies appear plentiful, but there is little or no shading. City wrought scrap, long stock, seems slightly weaker, but there has been no material change in offerings. A bullish factor at this time is the attitude of government authorities regarding prices. As reported last week, bids on several government lots have been rejected as too low. Bids on 28,775 pounds of drop forging flat steel bars will be received by the government authorities here up to Sept. 16, and bids on 845 tons of shell forgings will be received up to Sept. 25. The Norfolk & Western railroad will take bids on a large tonnage of miscellaneous scrap up to Sept. 17.

Lighter Grades Are Advanced

Philadelphia, Sept. 16.—Sales of scrap in this district the past week have been chiefly in the lighter grades. Consumers of heavy melting steel seem disinclined to enter the market while the labor situation remain unsettled. The lighter grades are scarce and under the steady demand have advanced $1 a ton, this applying especially to machine shop and blast furnace turnings and cast-iron borings.

The Philadelphia district ordnance bureau will receive bids until Sept. 24 on approximately 750 tons of 9.2 high explosive shell forgings at the plant of William Wharton Jr. & Co., Easton, Pa., and until Sept. 23 on approximately 5386 tons of the same material also at the plant of William Wharton Jr. & Co. Bids will be received until Sept. 24 on 755 tons of 75-millimeter forgings at the plant of the Worthington Pump & Machinery Corp., Hazelton, Pa.

Fair Demand for Cast Iron Scrap

Pittsburgh, Sept. 16.—A rather good demand is noted here for cast iron scrap with some fair sales of cupola, heavy breakable and stove plate being made at prices from 50c to $1 a ton over those which recently prevailed. Some demand also is noted for wrought scrap, and with offerings extremely scant the market is showing considerable strength in that direction also. Malleable scrap constitutes a strong spot in the market as offerings are below requirements. On strictly steel plant material trading is as dull as it has been for several weeks past and the price tendency is toward lower levels because of a little more anxiety on the part of dealers to sell. Buyers probably would have no difficulty now in picking up heavy melting steel at $21 per gross ton, delivered, Pittsburgh. No large tonnages of this grade are available, but at the same time quite a few cars are coming onto the market because of rejections by original producers. A Pittsburgh district steel manufacturer report the purchase of 1000 tons of machine shop turnings at $12. Some disposition is noted among dealers to doubt the accuracy of this report in view of the fact that some of them, short of the market, have been offering 50 cents to $1 a ton more than the figure at which this purchase was made. Bundled sheets are not in particularly strong demand and can be bought for slightly lower prices than recently prevailed. Sales of No. 1 cupola cast recently have been made as high as $26 and of heavy breakable cast as high as $23.

Mills Buying More Scrap

Buffalo, Sept. 15.—Mills are steadily increasing production and demand for scrap is stronger. Fair tonnages have been sold to the mills at prevailing market prices. There is a heavy demand for borings and heavy axle turnings. The car shortage is worrying shippers.

Large Steel Purchase Reported

Cleveland, Sept. 16.—Quite a few scrap iron and steel dealers here look for scrap to drag for several weeks. Not only are melters out of the market entirely, but trading among dealers appears to have dropped to a minimum. The report that the leading user of heavy melting steel here has bought 50,000 tons of high-grade scrap steel from the government at about $21.50 is generally credited, and removes this melter from the active trading list. Most melters seem to be well stocked, and say they are awaiting labor situation developments. Considerable scrap is moving on contracts. Cars are increasingly difficult to get. Prices are weaker all along the line, but trading to give a basis for marking down is lacking.

Cincinnati Market Soft

Cincinnati, Sept. 15.—A soft spot has developed in the scrap market, due to slow demand during the past few days. Foundry scrap is just holding its own, but melters are not willing to contract ahead and the bulk of the business done is for metal to be shipped during the remainder of the year. Steel mill scrap is not in demand, and prices are not firm. The absence of business makes it hard to determine what present values are. Considerable complaint is still being made as to the shortage of cars.

St. Louis Market Unsettled

St. Louis, Sept. 13.—The scrap market is unsettled and some price reductions were made in dealers' lists during the week. Mills are not buying in this district, but foundries are extremely active, having all the work they can do through the balance of this year. Grades suitable for foundry use are in excellent demand. No. 1 railroad cast is quoted from $26.50 to $27, although a slight reduction from these figures is probably nearer actual

values. No. 1 cast agricultural machinery ranges from $26 to $26.50. Offerings by the railroads included the following: Wabash, 1800 tons; Frisco, 800; Missouri, Kansas and Texas, 1200, and the Mobile & Ohio, 600. All of this material was sold to dealers at slightly lower prices than have prevailed.

The St. Louis ordnance office is offering for bids, Sept. 23, approximately 4000 gross tons of 8-inch common shells and for bids Sept 25, 3543 gross tons of the same material, both at the plant of the Wagner Electric Mfg. Co.

Birmingham Market Improves

Birmingham, Ala., Sept. 16.—Demand for scrap iron and steel has improved and indications now point to considerable activity during the last quarter of the year. Prices remain firm and it is predicted by dealers may be advanced by the end of the month. Scrap is being shipped by dealers in this section to St. Louis and Chicago. Country scrap is being gathered more freely.

Wire Orders

To be Had Readily at Advances—Mills Are Sold Up

Pittsburgh, Sept. 16.—Makers of wire and wire products are sold up so close to probable production over the next few months as to be unable to give much consideration to new demands. Specifications are coming along quite freely and it is stated that new orders might readily be placed at premiums over the March 21 figures, now asked by most of the independent companies, if they would take the business. The American Sheet & Tin Plate Co. alone is holding to the March 21 prices and is in the same position as the independents in the matter of new bookings, being sold ahead over the remainder of this year. Specifications are running considerably ahead of production and only by drawing on warehouse stocks are manufacturers able to keep abreast of the buyer's requirements.

Consumers Taking Wire, Nails

Chicago, Sept. 16.—Continued heavy demand for wire and nails is being received by makers and with a better supply of cars shipments are moving forward in large volume. Jobbers are large buyers and ask immediate shipment because they are unable to accumulate stock, as consumers are taking the material as fast as it reaches them. This shows a gratifying state of the market and with heavier demand than mills are able to meet, prospects for future business are excellent. Most makers are unable to entertain all the inquiry presented them.

The J. I. Case Plow Works, Racine, Wis., has been re-incorporated without change in name under the laws of Delaware, with a capital of $5,000,000 first preferred; $5,000,000 second preferred and 125,000 shares of non-par value common stock. The new company absorbs the Wallis Tractor Co., Racine, Wis.

Plate Gain is Continuing

France Places 6000 Tons—Belgian Cars Require 80,000 Tons—Lake Ships Call for Thousands of Tons—Prices Easy

Philadelphia, Sept. 16.—More business has been taken this week by one leading eastern plate mill than in any previous month, this being the fourth successive month to show such gains. Considerable domestic plate specification has come out, while export tonnages have increased. One mill has taken 6000 tons for shipment to France to go into two ships, while marine boilermakers are closing on some good domestic business. The Belgian car inquiry on which American builders are figuring calls for 10,000 cars of which it is estimated to require eight tons of plates. One mill that recently operated at 30 per cent now is running at 60 per cent.

Eastern Market Quiet

New York, Sept. 16.—With ship and car builders still out of the market for actual tonnages, the eastern plate market in this section continues quiet. Several prospects, however, are before the trade which involve several lots of oil tankers. One such includes plates for four or six tankers while another is said to involve 20 tankers of 10,000 tons capacity, one to be delivered in six months, and one every six weeks thereafter, all being intended for European oil trade. However, mill circles have not been asked to figure on the plates involved in any of these projects as yet.

Quote 2.50c on Large Lots

Pittsburgh, Sept. 16.—Plate mill capacity still is far from being heavily taxed and manufacturers no longer are holding out for the March 21 base, except on small tonnages and even then have difficulty in getting it. Several of the independents are meeting the price of 2.50c, recently quoted by the Carnegie Steel Co. on a navy department battleship inquiry, on large tonnages, while on orders of less than 500 tons, 2.55c to 2.60c, Pittsburgh, are the more common quotations. Few of the mills have more than a few weeks' rollings in sight.

Vessel Contracts Reported

Cleveland, Sept. 16.—Reports are current of large vessel contracts, pending or placed with lake yards. One estimate places the steel requirements of these contracts at many thousands of tons. These negotiations have been under way for several weeks and have been previously referred to. It is understood that the contract for tanks and stills for the new Standard Oil of Ohio refinery at Cleveland, placed with an Alliance, O., shop, involves about 3000 tons and represents only a portion of the work of this kind. The total of the latter it is said may run 8000 to 10,000 tons.

Western Market Easy

Chicago, Sept. 16.—Demand for steel plates in the West is less active than for bars and while the leading independent has sufficient business on its books to take care of almost its entire production to the end of the year, the leading interest has considerable capacity not yet covered by contracts and is able to take on more tonnage. Indications are that considerable demand for ship material will come from Pacific coast builders within a short time and take care of part of this capacity. Repairs of freight cars, which is being undertaken on a larger schedule than formerly is also counted on to give considerable assistance.

Order Books

In Tin Plate Fill Mills to Dec. 1—1920 Sales Soon

Pittsburgh, Sept. 16.—Although new business in tin plate recently has been of moderate proportions, order books are filled up to a point where the present rate of operations, which average around 95 per cent of capacity, will be necessary until about Dec. 1 to get the material out. The American Sheet & Tin Plate Co., probably will open its books for first quarter and first half of 1920 business about Oct. 15. As specifications for January shipments must be placed by Nov. 15, and as present bookings are sufficient to keep the mills going practically full through November, the prospect is for no interruption for the next five or six months. Some export inquiries still are coming out for tin plate but those calling for prompt delivery are being declined. Inquiry is noted for 10,000 boxes of tin mill black sheets from Japan. Quotations are firm at $7 per base box, Pittsburgh, on domestic orders. While a little less has been accepted on export orders some tonnage also has been booked above that figure.

Japanese Inquiry Current

Youngstown, O., Sept. 16.—Orders for tin plate in this district are heavy but makers decline to close for any further tonnages. An inquiry for 8000 boxes of 20 x 30-inch, charcoal plates from a Japanese interest is before a dealer here. The leading maker is out of the market until the end of the year.

Strip Steel Makers Take Little New Business

Pittsburgh, Sept. 16.—Strip steel manufacturers in this district are not taking on much new business except from regular customers due to the fact that present bookings of both hot and cold rolled are sufficient to absorb probable production over the remainder of the year. While occasional sales are being made at premiums over the March 21 prices no concerted effort is being made to obtain an advance, although a number of insistent demands daily are coming out on which buyers probably would be glad to pay higher prices to secure supplies.

Select New Bar Orders

Demand Continues in Excess of Capacity—Mills Scheduled Well Into Fourth Quarter—Small Sizes Active

Chicago, Sept. 16.—Demand for soft steel bars is in excess of mill capacity and makers are unable to care for all the business being offered. After warning that deliveries during the present year might be uncertain unless specifications were filed promptly, contract holders have sent in specifications until mill schedules are cared for almost through the fourth quarter in some instances.

Hard steel bars are in good demand without any change in price. Manufacturers utilizing this form of steel are taking large tonnages while reinforced concrete work is not represented to any extent.

Bar iron is the weakest and most unsatisfactory product and western mills are operating only part time. A fortnight of idleness resulted in accumulating scarcely sufficient business to operate for a full week. This condition is attributed to the absence of railroads from the market. Prices remain firm at 2.62c, Chicago mill, which it is claimed is perilously close to the cost level, while one mill which is now idle is unwilling to take anything under 2.75c, mill.

Mills Falling Farther Behind

New York, Sept. 16.—Steel bar producers have settled down to getting out production while in the meantime trying to keep customers satisfied on deliveries. New sales are few and not invited since mills are gradually fall farther behind. Some of the larger producers say they have nothing to offer customers here under three and even four months. However, most of the latter appear covered for immediate requirements.

Export Trade Reviving

Philadelphia, Sept. 16.—Steel bar mills report being filled for next three months on practically all sizes for domestic delivery and are not seeking new business. Somewhat of a revival in the export bar trade is being felt to Italy, Japan and South America. Mills are firm on present prices. Iron bars show no additional activity and general quotation still is 2.50c, Pittsburgh.

Turning Down Much Business

Pittsburgh, Sept. 16.—Steel bars running 1 inch and smaller still are in brisk demand but inquiries for these sizes are not getting much attention due to the fact that practically all manufacturers are sold up for the next 60 days at least and some of them for an even longer period. Considerable business of this sort is being turned down and those manufacturers not in a position to take on additional tonnages are showing a disposition to book only such specifications as are attractive from a mill standpoint. Demands for the larger sizes outside of some moderate inquiries for 3-inch rounds for export are light and on these bars all manufacturers can make fairly early delivery. Little basis exists in sales except possibly for export for a price higher than 2.35c, Pittsburgh, although the Cambria Steel Co. continues to quote 2.50c and some export business continues to be taken at that price. Concrete reinforcing bars are in good demand for quick shipments with few of the mills in a position to take on much tonnage of that sort. Demand for iron bars is reported to be better owing to the sold-up condition of the steel bar makers and common bars now are firmly held at 2.75c, Pittsburgh, and refined at 3.00c. Chain makers are not especially heavy buyers of iron bars at present as demands upon them are moderate.

Turn Down Bolt Inquiries

Chicago, Sept. 16.—Practically all manufacturers of bolts and nuts are working on full order books and with heavy inquiry constantly being received, they are forced to turn down business continually. Demand is coming from all classes of users and is much heavier than can be booked. Prices are firm and no indication is shown of a change in either direction.

Demand Gaining Steadily

Pittsburgh, Sept. 16.—Makers of cold finished steel bars and shafting note a moderate but steady gain in both orders and specifications, but while a fair amount of business is before them no great difficulty is being experienced in supplying the needs at a mill operating rate of around 60 per cent of capacity. Prices are holding at 3.60c, base Pittsburgh.

Bands Sell at 3.50c for Export

Pittsburgh, Sept. 16.—Small sales of band steel for export are reported to have been made as high as 3.50c, Pittsburgh, and the manufacturer taking this business is quoting 3.35c, against domestic inquiries for this class of material. The regular market base is 3.05c, Pittsburgh, and no business to speak of has been placed at a higher price. The quotation of 3.35c is frankly admitted to be merely a notice to buyers that the company quoting the price is out of the market for immediate business. Only a moderate demand exists for hoop sizes and not much mill capacity now is being devoted to cotton ties, as makers rolled comparatively generous tonnages and are meeting specifications from these stocks.

Full Market Prices Cut on Navy Bids

Washington, Sept. 16.—Both the Carnegie Steel Co. and the Jones & Laughlin Steel Co. submitted bids lower than the prevailing market prices on an aggregate order of 5500 tons of plates and shapes for the tender DOBBIN being built by the navy at the Philadelphia navy yard. The bids were opened here last week. Both companies bid 2.50c on approximately 4000 tons of plates and 2.40c on approximately 1500 tons of shapes. These are the same prices submitted by the Carnegie company in bidding on 28,000 tons of plates, shapes and bars for battleships No. 49 and No. 50. Contracts for the steel for the tender have not been awarded. Other bidders on this tonnage at the full market prices of 2.65c and 2.50c respectively, were the Bethlehem Steel Co., Midvale Steel & Ordnance, and the Brier Hill Steel Co. R. C. Hoffman Co., offering Phoenix Iron Co. steel, bid on some schedules at market prices.

Ample Supplies

Now Apparent in Sheet Bars—Wire Rods Are Tight

Pittsburgh, Sept. 6.—Ample supplies of sheet bars and rolling billets now are moving to the finishing mills on contract. Talk of a shortage of sheet bars has entirely ceased, and open market activities are extremely limited. Practically full ingot capacity operations by the Carnegie Steel Co., for several weeks past have enabled that company to catch up with its specifications and other steel companies having a surplus of semifinished steel over their own finishing mill requirements appear to be in pretty much the same position. Shipment of billets, sheet bars and other semifinished steel can be made in open cars and since there has been no such scarcity of this kind of equipment the movement of the finishing mills has been practically unhampered. Makers of wire rods not only are meeting contract obligations, but also have moderate tonnages available for the spot market. Prices of billets, sheet bars and rods are steady at the March 21 levels.

Eastern Producers Sold Up

New York, Sept. 16.—Eastern consumers of wire rods have been seeking some mill that would take on tonnages of small size but have found producers slow to accept such business except from old customers. The quotation of $52, Pittsburgh, which has been standing for some time for domestic business, continues to be put out, and in one instance of 500 tons, a Pittsburgh district maker sold at that figure. Most producers, however, are inclined to refuse to quote, since they are filled up tightly and are limited in their supply of steel. It seems possible that a figure of $54 to $55 might bring out some rods, but this is a question, as deliveries are uncertain.

Served Regular Trade Only

Youngstown, O., Sept. 16.—Sales of sheet bars in this district are few and are limited to regular customers. The mills are committed until the first of the year and decline to take on any tonnage beyond then. A Cleveland interest and several dealers in the Pittsburgh district are offering tonnages of sheet bars in the market here. These tonnages, it is understood, are of a resale nature. One large producer of semifinished ma-

terial here remains out of the market entirely, having only enough material to supply his own needs adequately.

Would Reroll Shell Tonnage

Philadelphia, Sept. 16.—The semi-finished steel trade in the East continues to feel the adverse influences of the labor unsettlement as well as government offerings of wartime material. One purchaser of French shell tonnages scattered all over the country and said to aggregate 130,000 tons, has been negotiating with eastern mills to have them reroll 60,000 tons into bars or small billets but cannot find takers.

Good Buying

In Cast Iron Pipe in West—Mill Product Demand Keeps Up

Chicago, Sept. 16.—Detroit, which has been the best customer for cast iron pipe of any city during the season, will open bids Sept. 18 on 5000 tons of medium sized pipe. Figures will be taken at Columbus, O., Sept. 29, on 650 tons of 36-inch pipe. Shops are anxious to obtain business in larger sizes, as they have more orders for small pipe in proportion than they care to take. The United States Cast Iron Pipe & Foundry Co. has taken 1600 tons at Salt Lake City, and 60 tons at Pine Bluff, Wyo. The National Cast Iron Pipe Co. has taken 370 tons at Spirit Lake, Iowa. Quotations remain unchanged, but on small sizes some makers are increasing their prices somewhat, while the tendency is to shade prices a trifle on larger sizes, which are now more desirable.

Municipal Buying is Lacking

New York, Sept. 15.—Activity in the eastern cast iron pipe market still is being confined chiefly to buying for private account. No municipal demand of consequence is noted, and export buying, although somewhat improved, is still far from being large. No sales of more than 100 tons were reported during the past week in the foreign market. Most prices are firm.

New Features Are Lacking

Pittsburgh, Sept. 16.—Practically no change is seen in the tubular goods situation from that of the past few weeks. Plenty of demand still exists for lapweld pipe, particularly for line pipe for oil producers, but early 1920 is the best possible delivery against new business. Manufacturers are adverse to taking on commitments beyond the end of the year. Demand for buttweld pipe is good, and the boiler and mechanical tube business is improving, although in the latter more or less price-cutting still is going on.

Southern Plants Busy

Birmingham, Ala., Sept. 16.—Orders for cast iron pipe are being received steadily, and the plants of the United States Cast Iron Pipe Co., the American Cast Iron Pipe Co. and the National Cast Iron Pipe Co., are working almost at full capacity. The melt of pig iron is larger than in several years, and prospects are bright for several months of good business.

Ferro Market Unsettled

Some English Makers Reported to be Quoting $105—Domestic Price of $108 Named—1920 Spiegel Wanted

New York, Sept. 16.—The ferromanganese market naturally has been quiet after the mild flurry that was created by the filing of the formal complaint against the importers' price with the Washington federal trade authorities. Foreign makers are quoting $105 and upward through their New York representatives, but no active negotiations are said to be on just now, beyond the effort of several Ohio river and valley consumers to cover on 200 and 300-ton inquiries. One representative of a British producer has received advices that the quotation of $105 was its lowest, since it has found its producing costs have advanced $2.50 a ton since its last American sales. It is the belief of some British agents here that some small shipments of Russian manganese ore have been made from the vicinity of Poti in the past several months, but that no regularity can be figured on as yet from that source of supply.

Buying of ferroalloys has been light the past week, due probably to the uncertainty of the labor situation. Considerable interest was shown in the possible effects of the plan to impose a duty on imports of tungsten ore, but the consensus of opinion in the ferroalloy trade is that the bill will not pass the senate in the form in which it passed the house. Domestic makers report sales of ferrotungsten at $1.25 to $1.30 a pound contained. The ferrovanadium market is unchanged, sales of alloy low in silicon being again made at $7 to $7.50 a pound, contained, in good quantities, and $9 or higher for small lots. The ferrosilicon market is somewhat stronger than it was for several weeks, but prices below $85, delivered have not altogether disappeared. However large makers are asking upwards of $100 a ton, delivered, and a large tonnage probably could not be obtained at the lower prices. The ferrochrome market is irregular, prices being reported on a range all the way from 25 to 32 cents, in carload lots, for alloy containing 4 to 6 per cent carbon. Ferromolybdenum is obtainable with little inquiry at $2 a pound contained, delivered, any quantity.

Spiegel is Firmer

Philadelphia, Sept. 16.—Eastern spiegel producers have firmed up on prices and today $38 furnace for 18 to 20 per cent is declared to be the general quotation, although some domestic makers are said to have quoted even higher. Small sales have been made at $38 delivered.

English Makers Lift Prices

Pittsburgh, Sept. 16.—Although more or less unsettled, the market here for ferromanganese has a stronger tendency due to advices from the East that some of the English makers of this material late last week advanced their quotations to $105, c.i.f. Atlantic ports. Accompanying this report was an intimation that English producers at no distant date would seek to place their prices on a parity with those of American producers. This action of the English makers is believed to have been the direct result of the recent protest filed by the federal trade commission by American manufacturers of ferromanganese in which they claimed that English makers were "dumping" on American markets. News of the increase by the English producers has led one domestic maker to hold up a sale of 400 tons of 80 per cent ferromanganese which had been practically completed at about $108, delivered.

The market on 50 per cent ferrosilicon also is unsettled but by contrast with ferromanganese the price tendency is toward lower levels. Although some makers are quoting that material as high as $100, furnace, freight allowed, that price has found no recent basis in sales in this market; indeed, $80 appears to be the maximum price here and it is understood that a few carloads have been sold to Pittsburgh district consumers in the past few days at less than $80, furnace, freight allowed.

An inquiry is noted for 750 tons of 10 to 12 per cent bessemer ferrosilicon and a few other smaller inquiries also are coming out for this material, but actual sales are few, as most consumers are covered by contract and are depending on shipments against these bookings to meet their immediate requirements.

1920 Spiegel Wanted

Cleveland, Sept. 16.—Some consumers of spiegeleisen in Cleveland and surrounding territory are beginning to inquire for their first half needs but makers have not yet named a price for that delivery. One inquiry for 1000 tons is current. The market situation as to British ferromanganese is still clouded. Some of these producers are making no quotations whatever, awaiting developments in the "dumping" protest to the government by domestic makers. A quotation of $108, delivered, on domestic metal was made this week. Buyers are holding off some closing on inquiries recently put out and several thousand tons are pending in this territory.

Government Offers Spiegel

St. Louis, Sept. 15.—Bids will be taken by the local ordnance office up to Sept. 24 on 2034 tons of spiegeleisen at the plant of the Scullin Steel Co.

Imported Ore at 55 Cents

New York, Sept. 15.—The manganese ore market continues extremely dull. The price on imported ore has been established at 55 cents seaboard on a few scattering sales. Some spot Caucasian ore changed hands at this price, exwarehouse, New York.

Shape Market Uncertain

Structural Bookings for August Gained 4½ Per Cent, But Demand Seems Slowing up—Labor Difficulties Interfering With Building Work

New York, Sept. 15.—As the month progresses considerable uncertainty develops as to the showing September will make in the eastern structural market. During the first week it was generally thought the month would surpass even August, but the market has since become spotty, and fabricators at this time are exceedingly reticent about venturing an opinion as to what the month will develop. The present situation appears to be due chiefly to the unsettled labor situation. Many jobs, it is said, are being held in abeyance until labor becomes better stabilized. Architects and contractors state they find it difficult to make estimates. Some sizable tonnages have been placed, and there are other good contracts pending. In addition, there are a number of small awards which point to a good month. Prices on the general run of fabricated material range around $75 to $85. Structural bookings for August, according to the monthly statement of the Bridge Builders and Structural society, amounted to 141,000 tons, or 78½ per cent of the shops' total capacity. This is a gain of 4½ per cent or 7800 tons over the preceding month. August was the third largest month since December, 1916, only being eclipsed by July, 1918, when the total amounted to 116½ per cent, and December, 1917, when the tonnage aggregated 121 per cent. Following is a comparative statement:

Month	Per cent	Approximate tonnage
August, 1919	78½	141,000
July	74	133,200
June	65	177,000
May	49	88,200
April	24½	48,100
March	17½	32,300
February	12½	22,500
January	12	21,600
December, 1918	29	52,270
November	27	48,700
October	43	77,400
September	60	108,000
August	57	102,000
July	116½	209,700
June	56	100,800
May	60	108,000
April	64	115,200
March	47	84,600
February	55	99,900
January	53	95,400
December, 1917	121	205,200
November	77	138,600
October	61½	110,700
September	29	52,200
August	38	68,400
July	41½	74,700
June	47½	85,500
May	56½	102,000
April	61	110,000
March	68	122,000
February	59	106,000
January	61½	119,000
December, 1916	86	148,000
November	78	134,000
October	77	133,500
September	52½	99,400
August	64	112,600
July	47½	83,600
June	58	100,000
May	80	137,000

Large Jobs Held Up

Boston, Sept. 16.—The threatened strike has had the effect in New England of bringing to a head many small projects using structural steel. Plans for this work in most cases have been changed to permit the use of shapes on hand in Boston warehouses, even though this often meant greater expense. The effect has been the opposite on larger work which has been held up pending developments. Deliveries from mill are far behind thus delaying work already started. Only small contracts have been let recently. Broadway theater, South Boston, will take 250 tons.

England Places Small Lot

Philadelphia, Sept. 16.—Eastern structural lettings generally continue slow as building is confined mostly to residences. The unusual feature of market is receipt of order from England for several hundred tons of shapes following receipt of similar order by same eastern mill little over a month ago. Such orders have been rare as the British appear to aim at retaining at home all such business.

Just a Fair Demand

Pittsburgh, Sept. 16.—Shape mills in this district are not heavily pressed with business while the fabricating interests are booking a fair number of orders that are not specifying especially freely for the plain material. The market is looking a shade better on fabricated steel because of the fact that several good sized lettings have increased shop bookings and competition on new work is a little less severe. The American Bridge Co. has taken orders for eight barges involving about 2500 tons of steel.

Building on Increase

Chicago, Sept. 16.—Increased tonnages of structural shapes are being required in western territory and building operations seem to be steadily on the gain. The largest tonnage closed recently involves 4000 tons for a building in Los Angeles, the owner not being known. The steel has been placed with the Inland Steel Co. Three bridges across the Mississippi river, in or near Minneapolis, have been placed within the past few days. Awards amounted this week in this territory total about 10,000 tons.

Labor Uncertainty New Factor

Cleveland, Sept. 15.—Demand for structural shapes in this district continues active but is confined to small tonnages. One of the largest fabricators reports that deliveries cannot be made from its plants in less than two months, and from present indications this time will be increased in the near future, as the mills are filling up. Prospective builders are being warned of the possibility of delay in shipments due to labor difficulties, but instead of this hastening action it apparently has had a tendency to slow up demand. The uncertainty regarding labor is not confined to the fabricating plants but extends into other lines of building activity. The current week is the first since building activity began in the spring in which no large tonnage for building purposes was placed. The city ordinance restricting the height of downtown buildings having been liberalized to allow 20 stories, some of the large buildings now under way will be carried up further. One of these is the Hanna building which would mean the additional need of 3000 to 4000 tons. The Cleveland Trust Co. is planning an extension of its building which will require approximately 4000 tons, but the general contract has not yet been awarded.

CONTRACTS AWARDED

Building for the Columbia Chemical Co., Barberton, O., 260 tons to the McMyler-Interstate Co.

Two bridges for Boston & Maine railroad, 400 tons each; to American Bridge Co.

Bridge for Baltimore & Ohio railroad, 400 tons; to McClintic-Marshall Co.

Highway bridge in South Carolina, 300 tons; to independent.

Government hangar at Lakehurst, N. J., 8300 tons; to Bethlehem Steel Bridge Corp.

Building for Manistique Pulp & Paper Co., Manistique, Mich., 400 tons; to Pittsburgh Bridge & Iron Co.

Six barges for the Standard Oil Co. of Louisiana, 2000 tons; to the American Bridge Co.

Two barges for the Standard Oil Co. of California, 500 tons; to the American Bridge Co.

New factory building for the Chevrolet works of the General Motors Corp., Flint, Mich., 600 tons, to the McClintic-Marshall Co.

Addition for the Manhattan Silk Co., New York, 150 tons; to the Bethlehem Construction Co.

Coke drier building for Union Carbide Co., Niagara Falls, N. Y., 100 tons; to Buffalo Structural Steel Co.

Ice deflector for Niagara Falls Power Co., Niagara Falls, N. Y., 100 tons; to Buffalo Structural Steel Co.

Building at Los Angeles, owner withheld, 4000 tons; to Inland Steel Co.

Kahl office building, Davenport, Iowa, 1200 tons; to American Bridge Co.

Franklin avenue bridge, Minneapolis, 580 tons; to Minneapolis Steel & Machinery Co.

Cedar avenue bridge, Minneapolis, 554 tons; to Illinois Steel Bridge Co.

Ore handling plant for Belfont Iron Works Co., Ironton, O., 500 tons; to Mt. Vernon Bridge Co.

Hull theater and office building, Peoria, Ill., 254 tons, to Decatur Bridge Co.

Lyndale avenue bridge across Mississippi river, Savage, Minn., 238 tons; to W. S. Hewett.

Deck plate girder spans, for the United States railroad administration, Chicago Rock Island & Pacific railroad, 231 tons; to American Bridge Co.

Home Oil Refining Co., Franklin, Pa., 210 tons; to American Bridge Co.

Foundry for Ohio Steel Foundry Co., Lima, O., 452 tons; to Toledo Bridge & Crane Co.

Building at Chicago for the Manz Engraving Co., 156 tons to Vanderkloot Iron Works.

First unit of Nash Motors Co. machine shop and assembling plant at Milwaukee, Wis., 430 tons; to Northwestern Bridge & Iron Co.

CONTRACTS PENDING

Additional steel for Chicago Tribune building, Chicago, 340 tons; bids being taken.

Additional steel for Chicago Tribune building, Chicago, 340 tons. Taking bids.

Two armories at Ames and Iowa City, Iowa, 420 tons each. Bids asked by board of trustees, University of Iowa.

Foundry for Chain Belt Co., Milwaukee, 400 tons. Bids being taken by F. D. Chase, Inc., Chicago.

Foundry and machine shop addition for James Mfg. Co., Fort Atkinson, Wis., 800 to 850 tons. Bids to be taken soon.

Car Repairs

Main Business Before Builders—5500 Tons of Light Rails Up

Chicago, Sept. 16.—Most car builders find themselves faced with the probability that comparatively little buying of new cars will be done for some time to come and are centering their efforts on obtaining repair work. A number of inquiries for this sort of service have been put out by railroads and are being figured, one of them covering 4000 cars. Inasmuch as a great deal of this repair work represents almost the entirely rebuilding of cars, it is too heavy to be handled in railroad shops. It is understood that all box cars bought by the railroad administration have been assigned and accepted but that some gondolas remain in the hands of builders. Several smaller car building companies have as much repair work as they can handle during the remainder of 1919 and for some distance into 1920. The Southern Pacific railroad has let 15 baggage cars to the Pullman Co., and the Fremont & Gulf railroad is inquiring for 10 flat cars.

Inquiry for light rails continues active and mills have their production booked ahead for considerable distance. Inquiry for standard rails for 1920 delivery is being put forth by important lines acting on the assumption that railroads will be returned to their owners at the beginning of the year. This tonnage promises to be heavy.

Europe Wants Rails

Philadelphia, Sept. 16.—The one interesting export inquiry for rails calls for 6000 tons of 12-pound sections for European delivery. Various European countries are after small tonnages of rails of almost all weights up to 45 pounds.

Car builders are following closely the Belgian inquiry for rolling stock which calls for about 10,000 freight cars.

Big Demand for Light Rails

Pittsburgh, Sept. 16.—Heavy demands are coming out for light rails, especially for export, but not much activity is noted in standard sections or in track equipment. One of the export inquiries for light rails is for 100 miles, or about 5500 tons, but the source of the inquiry is not made public. These rails, rolled from new steel, are held firmly at 2.45c, Pittsburgh, but that price is being shaded by makers who reroll old standard sections to the lighter gages. Makers of spikes are booked to the end of the year on the smaller sizes and not inclined to take on new orders for delivery during this period.

Sheets Sold

To End of Year Generally—Many Orders Cannot be Accommodated

Youngstown, O., Sept. 16.—Sheet mills throughout the Mahoning valley are rolling again at top speed. Enough business is scheduled to warrant steady operations until the first of the year. Makers have no desire to commit themselves beyond this date. Although a large quantity of the business is of a contract nature still a good assortment of new specifications are current. One large maker here is taking only specified business for next quarter delivery. During the past two weeks a large quantity of business has been refused by several makers in this district.

Blue annealed sheets are in strong demand but the mills are not in a position to handle any further tonnages. Enameling interests are particularly active for blue annealed. Considerable tonnages are wanted by consumers in Cuba, South America and Japan. The Japanese continue to inquire heavily for galvanized also.

The Consolidated Steel Corp. is asking the various independent steelmakers, affiliated with it, to increase their allotments of finished product for export. At present the mills allied with this corporation agree to supply it with 10 per cent of production. It is understood that the valley interests affiliated with the corporation are not in position to comply with the request now. The Deforest plant, Niles, O., of the Republic Iron & Steel Co. is in operation.

No Room for New Business

Pittsburgh, Sept. 16.—Makers of sheets still are besieged with new demands to which they can give no consideration. Practically all such inquiries, even from regular customers, are being turned down because all manufacturers are committed for their probable production during the remainder of this year. No signs are apparent that buyers will not take every ton of sheets they have ordered and it is only through failure on the part of buyers to specify against orders that any tonnage would become available for the spot market. Mill operations continue at a high rate with the American Sheet & Tin Plate Co., doing better than 95 per cent of capacity and the independents also averaging close to that rate at mills not affected by labor troubles. Prices show no particular change and the market is firm at the March 21 basis.

Mills Sold for Year

Chicago, Sept. 16.—Producers of steel sheets are practically sold up for the remainder of 1919, and strong inquiry for 1920 delivery is being received. Producers are holding off as long as possible on this business and hope to be able to get well into October before being forced to take on tonnage for next year. Buyers are offering to accept contracts for 1920 tonnage without a definite price, on assurance they will be charged whatever price is current at the time of delivery. Current business is almost impossible to place. Prices remain firm and unchanged.

‡ Producers' price. Outside market unchanged 22.25c to 22.50c, casting 21.62½c to 22c, lake 22.50c to 24c.

NEW YORK, Sept. 16.—Business sentiment in the nonferrous metal markets has risen and fallen with the various turns in the labor situation. Consumers have not been active buyers of metals for a month or more. Zinc has been affected primarily by the threatened steel strike.

Further offerings of copper by second hand sellers appeared in the outside market the past week, but activity was light. The leading producers continued to quote 23.50c New York, for September delivery, 24.00c for October. Outside holders offered electrolytic at as low as 22.00c for ingot bars in warehouse, up to 22.50c for wire bars and contracts not yet specified against. Fourth quarter deliveries were sold at 23.00c. Some speculative operations were noted, short sales for deliveries the first and second quarter of next year being reported at 23.00c and 23.25c, respectively. Casting copper prices ranged from 21.75c to 22.00c, but supplies were scarce at these prices. Lake copper was offered by second hands at 22.50c, 23.50c to 24.00c by producers. Export business continues slow.

Several important galvanizers were in the zinc market just before the labor leaders announced the calling of a strike for Sept. 22, but upon that announcement they withdrew their inquiries and have not yet bought. The brass mills have not been buying heavily of late and the export trade continues checked by reason of the low exchange rates. The zinc market has declined steadily, sales today being reported at 7.15c to 7.20c, East St. Louis basis, September shipment. Fourth quarter shipment is held at about 10 points premium over nearby or 7.25c.

The American Smelting & Refining Co. advanced its lead price Sept. 15 to 6.25c, New York, an advance of $5 a ton. This was the first change in nearly seven weeks. During this time buying by consumers has been slack, but recently producers have been heavy buyers, either because they considered lead was a good investment under the present statistical position or because they wanted to cover certain contracts. Supplies are short and the production is asserted to be less than consumption.

Tin has been advancing steadily, both in this country and in London. Inquiry is brisk, over 500 tons being in the market Monday. Some tin plate makers are short of supplies of nearby tin, although they have contracts covering forward requirements. These interests also have been trying to pick up spot or nearby tin, but supplies are scarce, both here and in London. The market for Straits tin for August shipment from the Straits advanced from about 53.25c to 55.00c the past week; September from 53.00c to 54.50c; October-November-December shipment from 53.00c to 54.00c. Spot electrolytic tin was advanced to 55.75c, Perth Amboy. Spot 99 per cent tin is scarce at 55.00c, New York.

Export Inquiries Are Increasing

International Merchants Building up Trade on Service Basis—Steel Building Material and Steel Furniture Finding Sale in Europe—English Purchasers Interested in American Specialties—Greece Begins to Buy

NEW YORK, Sept. 15.—With the passage of the Edge bill by congress, which is now anticipated by exporters, the formation of foreign credits corporations, a relief from the hardships from a depressed foreign exchange, is in sight. This movement, already recognized in the action of the railway equipment houses, will be of more immediate benefit to the large dealers in export goods.

The foreign iron and steel trade opening up during September is showing a livelier tone in finished products than has been the case heretofore. While the orders are small in tonnage and money value, the total is measuring up to the best hopes of most houses. Foreign purchasers of American goods, it is said, are more frequently concerned with the service they are able to obtain in this market than over the matter of price. This is a feature of exporting to which various houses have been giving special attention and with satisfactory results.

The effect of this altering sentiment is recognized in markets as far apart as England and Japan. Merchants in both countries have recently let trial orders for certain iron and steel articles and have since confessed that they were merely testing out what kind of service they could obtain. In general they have been so pleased with this service that they are now promising to come back into the market with real orders. Judging from the volume of inquiries now coming in every day, it would seem as though these statements of foreign customers are being borne out.

Japan has been buying heavily of electrical machinery for mining. Some sales of pig iron to Japan were also noted. One house has sold Japan 2000 tons of pig iron and has received inquiries from the same source for approximately an equal tonnage. A sale of 15,000 tons of plates to Japan has been reported. An advance in the freight rates to the Orient is anticipated. The rate to India from Atlantic ports has been advanced 10 cents, it now being $1.10 per 100 pounds.

Oriental business continues to boom. One house is now quoting on 60,000 base boxes of tin plate. This commodity is becoming more scarce, and it is now said that it cannot be purchased in the United States for less than $7, although foreign purchasers are hoping to be able to cut under that price. Only recently the United States Steel Products Co. was quoting $6.75 on tin plate, but it is said that this price now has been advanced.

Buying Mining Machinery

South America is still purchasing the usual line of finished steel, and also mining and hoisting machinery. Brazil and Argentine are planning harbor improvements and material for building docks are being inquired for in this market. Brazil has purchased through one house 5000 reels of barbed wire, and has sent in inquiries for approximately 15,000 tons of rails. Argentine has been buying tubes, wire, pipe, sheets and tin plate. Both Colombia and Uruguay have been buying bars, although in small quantities.

The Balkan states have been sending in inquiries for all kinds of material but little, if any business has been closed. Shipments are difficult and the arrangements for payments have not been at all satisfactory. Greece has purchased a small tonnage of pig iron, and is interested in truck tractors, structural shapes, and railroad material.

English merchants are showing a greater activity than for some time past. American salesmen are unable to account for this, and while some are inclined to attribute the English inquiries to unstable conditions in that industry, others are suspicious that the Britons are starting negotiations with American producers merely to delay foreign sales on the part of the United States until they have settled themselves down on a basis of competition.

As a matter of fact some promising business has been closed with the English. England has been buying small tonnages of pig iron and has increased its purchases of steel billets. One house reported the sale of 500 tons of steel screw stock. English merchants have also become interested in American novelty goods, as the export houses prefer to call them. One of the English purchases reported was 500 tons of strip steel.

Belgium has been buying to the limit of her ability, and the total shows a healthy growth. Belgium has been especially interested in steel furniture and many sales are said to have been made.

Coal sales have been flourishing, American houses making sales to France, Holland and Belgium. This business is recognized as a temporary matter until the English mines resume full operations. French sales are picking up a little, although nothing of great purport has as yet been sold. It is said that the French are now buying mining machinery. A French sale of 10,000 tons of pig iron was lost recently, but a different quotation has been forwarded on a second inquiry for the same amount which it is hoped will get the business. A sale of several hundred tons of plow shapes was noted.

Some doubt is being expressed as to whether the French will purchase ship plates to any great extent in the United States. It is now said that the French will let contracts for the building of the ships to American yards, wherefore the plate business resulting therefrom would not technically be an export business at all.

Italy has purchased 300 tons of pig iron through one house, and a sale of 1500 tons of rods to Denmark was reported.

Export houses have not become very anxious over the threat of American steel workers to strike. They are inclined to believe that labor troubles will not be the basic reason for advances in prices. The prospective increase in prices will result more readily from the fact that many mills are filling up with orders, and in many lines have completely sold out for the fourth quarter. One of the largest mills has advanced its quotation to 2.50c, base, on bars. A small mill is still quoting 2.35c, but generally the mills are asking 2.40c and more. Notwithstanding the advance in price it is difficult to get deliveries. The mills will promise to deliver only within 60 or 90 days.

Exporters are expecting all iron and steel products to advance, although they acknowledge that for the moment the prices are holding firm. Plates and structurals are the only commodities which remain weak, and this is due to the fact that the mills have not as yet sold up to capacity.

Unions Divided on Steel Strike

Representatives Meet in Pittsburgh to Decide Question of Postponing Action Until After Industrial Conference—Radicals Said to Have Support of Amalgamated Association of Iron, Steel and Tin Workers

PITTSBURGH, Sept. 17.—Factional differences in the American Federation of Labor over the question of calling a strike in the iron and steel industry became more pronounced as the representatives of the 24 labor unions interested in the industry went into conference in this city today. The radical element urged that the unions proceed with their announced plan to strike Sept. 22, while the more conservative members counseled delay until after the industrial conference in Washington, Oct. 6. Both factions hoped to dispose of the question before adjourning.

Before issuing the strike call for Sept. 22, the committee last week had received telegrams from President Wilson and were fully informed of his desire that the strike call be held in abeyance until after the industrial conference. Notwithstanding this, however, representatives of the union now claim that they did not understand the President's position until after the call was issued.

The executive board of the Amalgamated Association of Iron, Steel and Tin Workers which met here yesterday is understood to have decided to urge the representative to stand firm for a strike next Monday. President Gompers did not attend the conference today, but it was stated that he would be represented. The general understanding is that Gompers has urged the representatives to delay the strike.

It is noted that the organizers no longer claim they have 90 per cent or more of the workmen signed up. They have modified their claims to about 52 per cent and when pinned down do not claim that many of the skilled workers are among their ranks. Instead of wholesale dissatisfaction among the men, it is doubtful if more than 5 per cent or at most 8 per cent of the men can be thus classified. A thorough investigation has shown that most of the new union recruits have been obtained from the foreign and more ignorant classes in the Mahoning valley. It is understood 80 to 90 per cent of the organized membership is from this source.

Unions Losing Favor With Public

WASHINGTON, Sept. 16.—While organized labor is keeping its own counsel as to plans for a strike in the iron and steel industry, events of the past week have given rise to speculation as to whether it will attempt to put its threat into effect. Even to those inherently prejudiced in favor of organized labor it is evident that it has lost much prestige by recent performances. This is reflected in part by speeches made in congress by members who either have been extremely favorable toward organized labor in the past, or at least have not opposed its principles. In addition to this it is believed the sentiment of the public has turned against organized labor.

This attitude has developed largely as the result of the strike of the Bos-

Unions Make $3 Cut Rate To New Members

THE effort of organized labor to attempt unionization of the iron and steel industry had its birth at the St. Paul convention of the American Federation of Labor, June 10 to 20, 1918. The labor leaders then declared that the failure of unionism to make any headway in the iron and steel industry during the past 25 years had demonstrated that the task was too great for any one craft to undertake. Therefore it was decided that the various unions whose crafts were represented among the employes of the iron and steel industry should join forces in a special movement against the industry. Accordingly, the national committee for organizing the iron and steel works was formed in Chicago, Aug. 1, 1918, with Samuel Gompers, chairman, John Fitzpatrick, acting chairman, and W. Z. Foster, Pittsburgh, secretary and treasurer.

The 24 organizations which joined with this plan were the International Brotherhood of Blacksmiths; Brotherhood of Boiler Makers and Iron Ship Builders of America; United Brick and Clay Workers; Bricklayers', Plasterers' and Masons' International union; International Association of Bridge and Structural Iron Workers; Coopers' International union; International Brotherhood of Electrical Workers; International Brotherhood of Foundry Employes; Amalgamated Association of Iron, Steel and Tin Workers; International Association of Machinists; Metal Polishers' union; International Union of Mine, Mill and Smelter Workers; United Mine Workers of America; Molders' union; Pattern Makers' league; Plumbers and Steam Fitters; International Union of Quarry Workers; Railway Carmen of America; Seamen's Union of America; Sheet Metal Workers; Stationary Firemen; Steam and Operating Engineers; Steam Shovel and Dredgemen, and Switchmen's union.

The first large obstacle which the combined unions encountered in their campaign for converts from the iron and steel industry was the high initiation fee prescribed by the constitutions of the various individual organizations. It was recognized that the amount of these entrance payments would limit seriously the number of recruits it was hoped to obtain since a strong effort was to be made to enroll the common laborers of the iron and steel industry. To overcome this difficulty, it was decided to set aside the constitutional provisions as to initiation fees of the various unions affiliated with the movement. All but three of the 24 organizations threw out the constitutions on this point and fixed a special initiation fee of $3; two of them reduced to $5 and one to $7.25.

ton police. Their position has been denounced broadcast and even by officials of the American Federation of Labor. Matthew Woll, vice president of the federation, in an address in New York last week apologized for the Boston strike by saying the federation granted charters to unions of policemen and firemen with the understanding that they would not resort to strikes. What was almost equivalent to an apology was the statement of Samuel Gompers that the situation in Boston is leading to anarchy, although he sought to place the blame upon the city and state authorities for not withdrawing their order against police affiliation with the federation. He recommended that the police return to work pending President Wilson's labor conference. Seeing the futility of their strike, the policemen have attempted to be reinstated, but their request has been refused by the authorities.

President Wilson and such members of congress as Senators Thomas and Myers have denounced the Boston strike as a crime. The senators have been extremely vigorous in criticizing the efforts of organized labor to unionize police, firemen and other public servants. Senator Myers said: "The strike at Boston is the most dastardly act since the time of Benedict Arnold." One high government official said it was nothing short of treason and should be treated as such.

These acts of organized labor, with the consequent resentment of the public, have a direct bearing on attempts to extend the tentacles of the federation throughout the industrial life of America. The attempt to force a strike in the steel industry is accepted by many as being one of the first steps in this direction, which it is hoped to further at the conference called for Oct. 6 in Washington.

To strengthen their position as much as possible, union leaders have given out figures purporting to show what the cost of a strike will be. It has been declared that a strike of the employes of the United States Steel Corp. will cost $11,500,000 a week. It also has been asserted that the weekly cost to union men will be more than $2,000,000, this statement being credited to Vice President Johnson, of the Bridge and Structural Iron Workers' union, who attended meetings at the offices of the American Federation of Labor.

"Most of this money will be spent by the 24 unions involved in payment of strike benefits," said Mr. Johnson. "Each union will be required to handle all benefits for its own members."

Mr. Johnson did not say how many union men in the steel industry would be given these "benefits," although some of his colleagues have said that the number ranges from 250,000 to 300,000, and that the number actually affected through affiliated industries will be as high as 500,000.

One of largest steel companies in the country has only 400 men who are affiliated with the union. It is estimated that the Steel corporation has 200,000 mill workmen. No figures as to how many are affiliated with the union are available here, but the proportion is known to be extremely small.

Announcement was made that Attorney General Palmer has begun a study of conditions in steel mill districts in some of which union men have said "the rights of free speech and free assembly have been violated," but this is considered to be a formal procedure on the part of the department of justice, undertaken at the instance of organized labor.

Gompers Unwilling to Take Responsibility

Washington, Sept. 16.—The fact that President Gompers said this afternoon that he will not go to Pittsburgh tomorrow to attend the meeting of 24 presidents of the steel workers' unions is taken to emphasize the fact that wide differences still prevail between the conservative and radical elements of organized labor regarding the proposed steel strike. It is believed that Gompers and the conservative faction favor postponement of the strike, with a probable decision to call it off altogether. While apparently some of the more radical members are ready to begin the strike next Monday, it is felt by some that the conservatives will maintain the upper hand and have it postponed, with the idea of avoiding a strike through conference here next month. The lack of strength of organized mill workmen is one reason for this attitude of conservatism.

Gompers claims he does not know what may be done at the meeting tomorrow, while according to reports from Pittsburgh the members of the committee give the impression that the decision is up to Gompers. This kind of tactics is taken to indicate that none wants to assume the responsibility for a strike and that it may be intended as a device to withdraw as gracefully as possible.

Await Rail Awards

Washington, Sept. 16.—Announcement by the railroad administration of its awards for 100,000 tons of steel rails is not expected to be made until after the return from his vacation of Director General Hines on Tuesday of next week. It is not certain that it will be made immediately after that, but the belief prevails that it will. No reason has been assigned for the delay in letting the contracts. So far as known Director General Hines has not protested against the prices, although it is well known that, in the course of the controversy Mr. Hines had with the defunct industrial board, he insisted that the prices of steel rails should be cut at least $10 a ton.

Resumes Meetings

Regular monthly meetings of the Pittsburgh Foundrymen's association for the 1919-20 season were inaugurated Sept. 15 at the Chatham hotel, with a paper by Enrique Touceda, consulting engineer, Albany, N. Y., whose subject was: "Some Pertinent Facts in Connection With Both Gray Iron and Malleable Castings." Mr. Touceda traced in interesting fashion the geology of iron, its early smelting and finally treated castings from a technical standpoint, the latter part of the talk being illustrated by lantern slides.

A. M. Fulton, vice president of the Fort Pitt Malleable Iron Co., elected president of the association at its June meeting, presided, and in addition to naming the regular committee appointed a committee to consider the revision of the by-laws.

The new committees follow:

Executive: C. S. Koch, Fort Pitt Steel Casting Co.; Henry Spilker, Sterrit-Thomas Foundry Co.; J. S. M'Cormick, J. S. M'Cormick Co.; J. Lloyd Uhler, Union Steel Castings Co.; C. F. Williams, Allen S. Davison Co.

Program: G. F. Tegan, THE IRON TRADE REVIEW, chairman; H. M. Meixner, Pittsburgh Piping and Equipment Co.; J. W. Guay, Fort Pitt Steel Castings Co.; T. J. O'Brien, Fort Pitt Malleable Iron Co.; R. A. Walker, *Iron Age*.

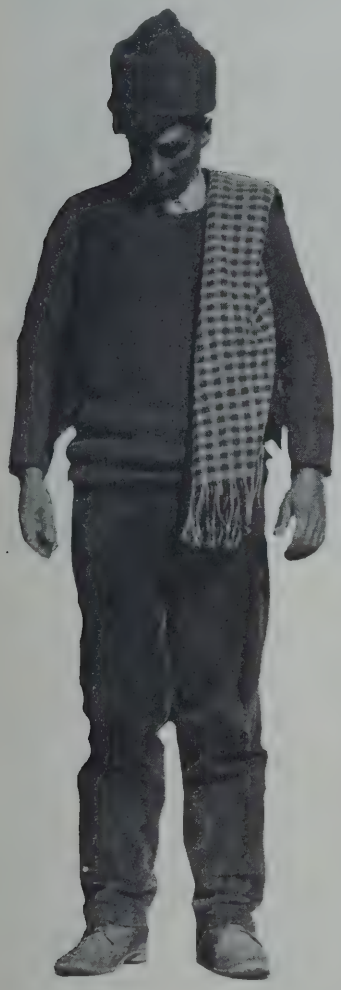
Entertainment: O. C. Dobson, Carborundum Co., chairman; C. W. Forcier, Mackintosh, Hemphill Co.; G. A. Bauman, Jones & Laughlin Steel Co.; C. L. Kirk, Kirk Supply Co.; L. W. Mesta, Mesta Machine Co.

Membership: L. A. Way, Lewis Foundry & Machine Co., chairman; John B. Coates, Pittsburgh Malleable Iron Co.; F. H. Clay, Allegheny Steel Co.; R. F. Eissler, Chicago Pneumatic Tool Co.; Thomas E. Reynolds, M'Conway & Torley Co.; Thomas Wilson, Rogers, Brown & Co.

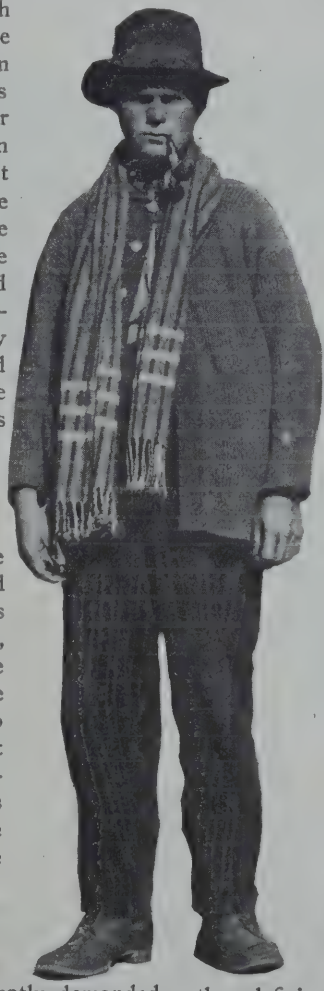
Foundry fund trustees: William J. Brant, J. Lloyd Uhler, Chas. H. Gale.

Call Institute Meeting

The sixteenth general meeting of the American Iron and Steel Institute, it is announced, will be held at the Hotel Commodore, New York City, Oct. 24 and 25.



Suspend Immigration? What of Industry?



BY A. J. HAIN

DURING the war when resentment against aliens of certain nationalities was keenest, when the country was reported to be overrun with enemies nurtured here for years, a great number of American citizens believed all foreigners should be excluded from the United States for all time. It was an extreme opinion due to the patriotic fervor of the times, and not concerned with economic conditions which might arise in the future. A man's patriotism was measured in many instances by the extent to which he said he would go in keeping aliens from our shores — even if he would not go all the way to the trenches. The man who said he would exclude only criminals and the illiterate from this country after the war was supposed to be less patriotic than the man who would keep all aliens out for a time, and the one who said he would keep them all out forever frequently was awarded the palm as the premier patriot. With the war ended and the transition of industry begun another factor was considered. The United States employment service issued reports stating that there was a great surplus of labor, and trades unions promptly demanded that the doors be closed against aliens. Bills were introduced in congress to suspend immigration for a number of years.

Industry navigated the perilous shoals much better than labor statistics indicated it would, and when the supply of men and of work balanced a bill was introduced in congress to exclude aliens but two years. Industry continued to make rapid progress until reports of a shortage of labor became frequent. Now with plenty of work for all those in this country who wish to work, and with many mills and factories unable to produce enough to meet demand, the opinion is general that the United States should invite the brawn of Europe and exclude only the criminal class.

Congress was becoming converted to this opinion, notwithstanding insistent efforts made to induce it to pass a restrictive measure and thus shorten the supply of labor, with the inevitable consequence of forcing up wages. But recently reports were sent out from London that 10,000,000 aliens are making preparations to come to the United States. On what basis this estimate was made is not clear, and it must be considered in connection with the fact that European countries are passing laws and taking other means to restrict emigration. England is considering important regulations.

Frederick C. Howe, commissioner of immigration at Ellis Island, New York, after an extensive survey made personally in European countries, recently estimated that 5,000,000 wish to come to this country. According to figures compiled by American industrial executives that number of immigrants, assuming all were men, would not supply more than half the number of workmen needed in the industrial establishments of this country today. It would make up only the deficiency due to the suspension of immigration during the war. The experience of France is similar in some respects to that of the United States. "France for the French!" was the cry of all French-

men as the war came to an end. The restoration of industry in France has been slower than in any of the large European countries, save possibly Italy, but France now is importing thousands of Italian workmen to work her furnaces and mills. While work is not so plentiful in Europe nor wages so high as in the United States, a fact which will weigh against a serious exodus of aliens in the United States, nevertheless industries over there are steadily increasing their operations. The demand for finished materials is so great that as the industries recuperate the number of aliens seeking to come to the United States may be expected to decline.

In the meantime, European nations probably would welcome any action on the part of the United States barring their workmen, and such legislation would be more effective than any of that which they themselves could hope to enforce.

* * *

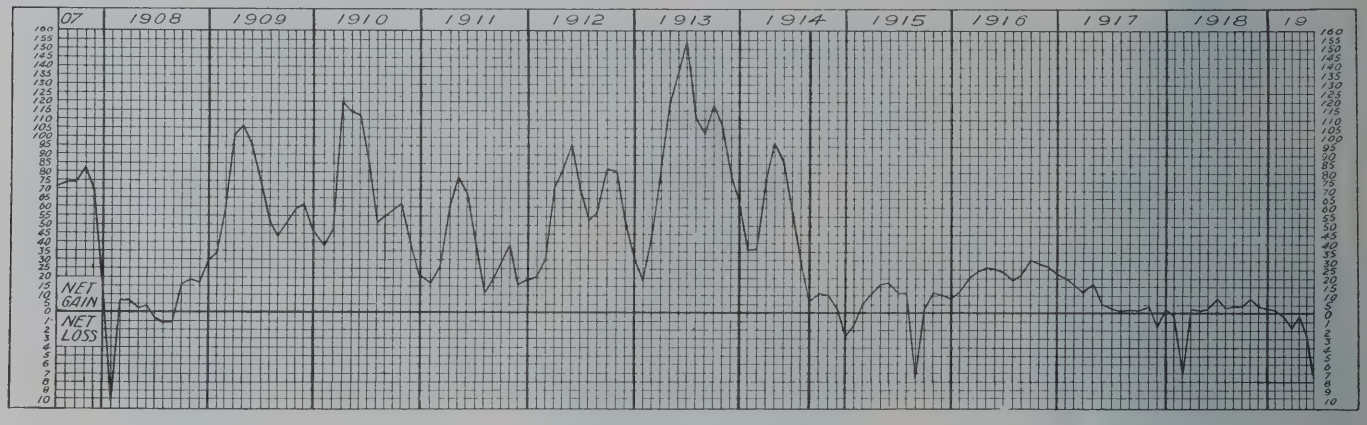
THE United States gained in population by immigration each year during the war, the total net gain for the entire period being 522,768. This represents the distinctly alien class, and does not include those who arrived or departed for temporary purposes.

In the five fiscal years previous to the war the net gain in population by immigration was 3,371,809. Assuming that immigration would have continued at the same average rate, this country would have added 3,209,041 more aliens to its population had the war not occurred. Computed on the basis of the average percentage of males among immigrants in the past 20 years, the loss to this country was 2,182,120 men. No allowance in this calculation is made for a progressive increase in immigration which might naturally have occurred. It represents a loss as to which there can be no doubt.

In the fiscal year ended June 30, 1908, the net gain in population was but 387,797, following a period of financial depression. In February, 1908, the tide turned strongly toward Europe, and the net loss in population during that month was 10,432. By 1909 conditions were somewhat righted and the net gain was 525,984, increasing to 839,134 in 1910, and dropping again to 582,921 in 1911, from which point it steadily rose to 915,142 in 1914.

The year 1915 left us with a net gain of but 122,626, many aliens in this country having been called to the colors. In succeeding years, however, while the doors of this country were still open to them, a noticeably less number of foreigners departed. The number to leave constantly diminished, while at the same time European nations were forbidding emigration. The net gain in population in 1916 was but 169,061. The figure increased to 229,126 in the following year, and then fell abruptly as the United States entered the war. The net gain in the fiscal year 1918 was but 16,033, and in 1919, 17,610.

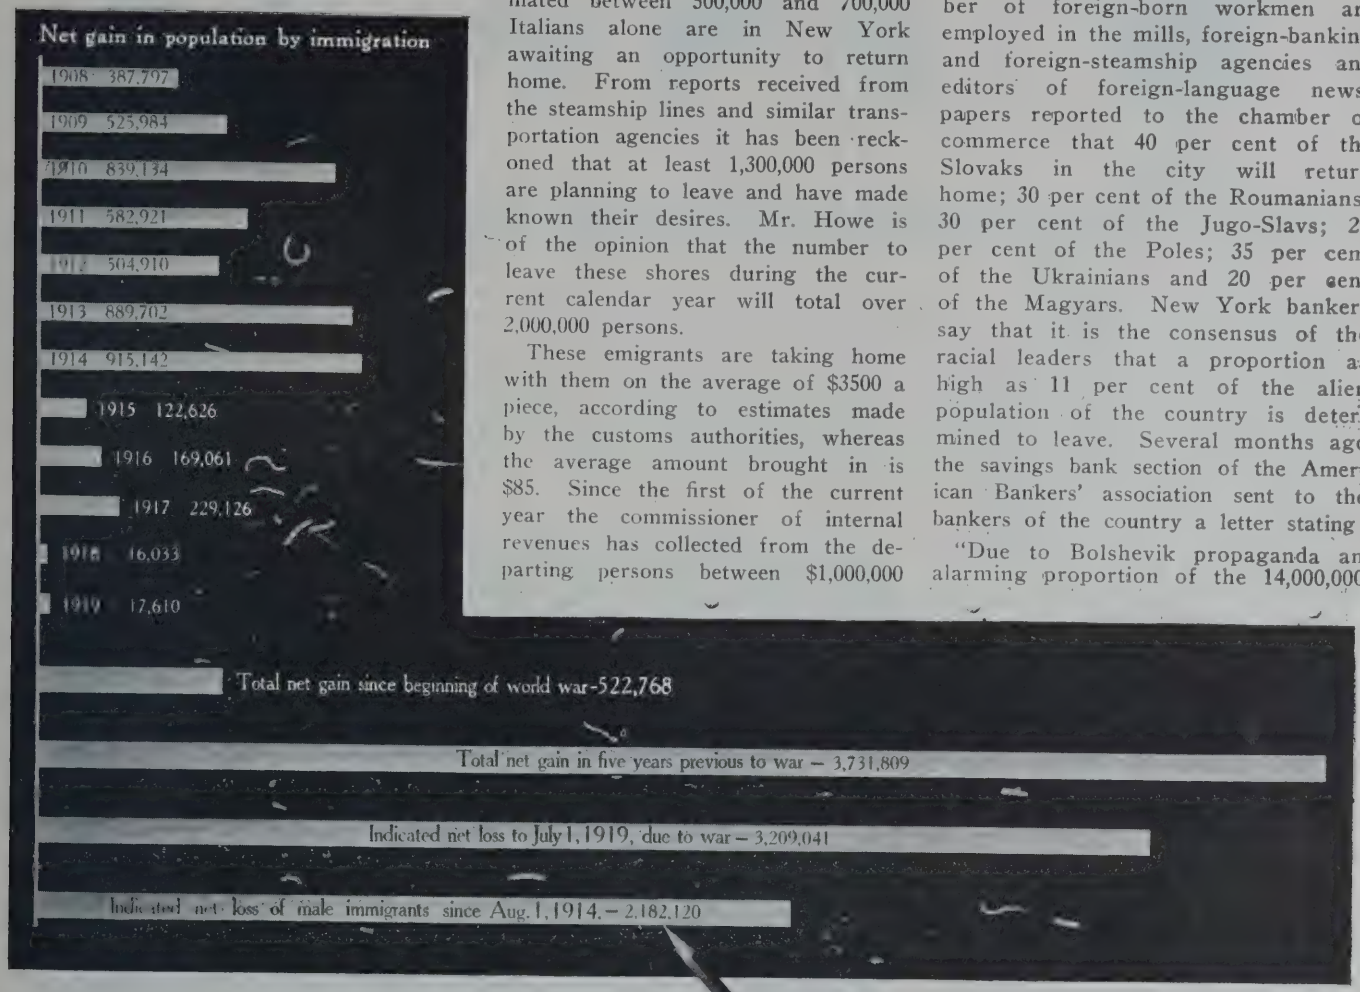
How intimately the subject of immigration is bound up with that of labor supply is evident from an analysis by the president of a large manufacturing plant. He states that there is a shortage of 11,000,000 workmen in this country, nearly one-fourth of which he ascribes to the interruption of immigration. The analysis is interesting in the light of efforts now being made to suspend all immigration:



Due to lack of immigration	2,500,000
Due to decrease of working hours from 10 to eight on the basis of 10,000,000 workmen	2,000,000
Men engaged in the automobile and truck industry, including factory workers, garage workers, chauffeurs, etc., not similarly engaged a few years ago	5,000,000
Greater demand for help everywhere, in homes and on farms, due to higher wages and more luxurious living	1,000,000
Unusual amount of road work, due to appropriations by congress and states	500,000

Estimates of the number of men needed in American industries today may vary, but the fact remains that an increasing number of industrial establishments, and mine operators are reporting their inability to get men, regardless of the amount of wages paid, and that this condition obtains while demands on plant capacity are steadily increasing, on the eve of what is predicted to be "America's greatest period of industrial prosperity."

* * *



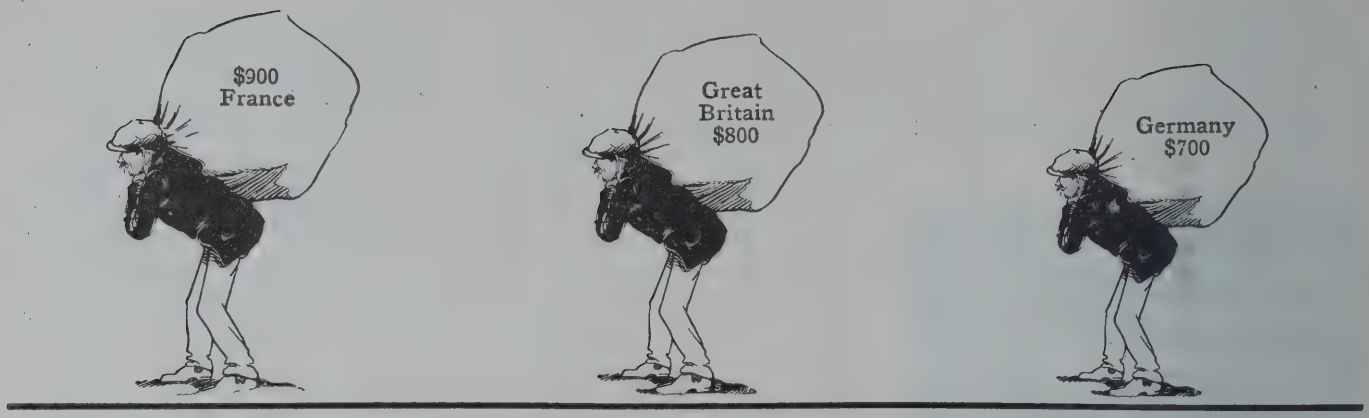
LONG lines of foreign-born workmen waiting to withdraw their savings, obtain passports or steamship tickets in the principal industrial centers of the country have caused some fear the emigration movement may attain serious proportions, but statistics compiled by the bureau of immigration up to July 1 show that since the war ended the number of emigrants has not greatly exceeded the immigrants. However, the government did not abolish passport-permit requirements until July 11, and it has not yet lifted the restrictions as applied to subjects of Germany, Austria-Hungary, Bulgaria and other nations which were associated with them. Estimates of the number of aliens preparing to leave the United States vary from 1,300,000 to 6,000,000.

According to a canvas made by the Inter-Racial Council, New York, those who have made preparations to leave, and who have either tried to book passage or have actually made a deposit on passage, include 300,000 Poles; 40,000 Greeks; 100,000 Jugo-Slavs; 150,000 Russians; 60,000 Czechoslovaks; 150,000 Hungarians; 300,000 Italians; 50,000 Lithuanians; 50,000 Ukrainians; and 200,000 of other races.

THE "WAVE" OF IMMIGRATION, MONTH BY MONTH, SHOWING NET GAIN OR LOSS IN POPULATION IN THOUSANDS

These figures are the result of a canvas made by the council in June and it is believed that they are conservative. The council believes that at least 1,500,000 foreign-born are preparing to leave immediately, which is a number equal to all the domestic servants in the country, equal to all the carpenters and coal miners, or equal to all persons engaged in clerical occupations in the United States. The council also is advised that the possible immigration will be composed chiefly of Jews and Syrians, trading peoples primarily and not usually laborers.

Emigration during the first eight months following the armistice exceeded the immigration by but 15,117 persons, according to statistics published by the department of labor. The departures from our shores, however, are comprised largely of grown men, potential laborers, whereas the small volume of immigrants has consisted of the usual mixture of men, women and children.



According to the opinion of Commissioner Howe, the outgo of laborers will increase with the fall months. During November, 1918 the emigration totaled less than 4000 persons, whereas during June, 1919, the total was in excess of 25,000.

The departure of these persons has been delayed chiefly by the lack of steamship accommodations. Commissioner Howe said that they have been leaving at the rate of 1500 persons a day, that it has been estimated between 500,000 and 700,000 Italians alone are in New York awaiting an opportunity to return home. From reports received from the steamship lines and similar transportation agencies it has been reckoned that at least 1,300,000 persons are planning to leave and have made known their desires. Mr. Howe is of the opinion that the number to leave these shores during the current calendar year will total over 2,000,000 persons.

These emigrants are taking home with them on the average of $3500 a piece, according to estimates made by the customs authorities, whereas the average amount brought in is $85. Since the first of the current year the commissioner of internal revenues has collected from the departing persons between $1,000,000 and $2,000,000 in income tax. It has been estimated that they have taken out of the country to this date something between $2,000,000,000 and $3,000,000,000. Mr. Howe pointed out that while statistics of the department made it appear that 231,957 persons arrived in this country during the first eight months following the armistice, and only 247,074 departed, as a matter of fact the departures consist chiefly of laborers, whereas most of the men arriving are commercial travelers. He is of the opinion, consequently, that the ranks of American labor have been depleted tremendously without any corresponding gain through the immigation of laborers. The westbound movement of ships was taken up almost exclusively with troops in the month following the armistice. As a consequence there were no third class or steerage quarters available. This situation is now altered and Mr. Howe thinks that beginning in September or October the influx of immigration will be perceptible. He does not anticipate, however, that the immigration during the next six months will be sufficient to replace the number that previously have departed.

In Cleveland, where a great number of foreign-born workmen are employed in the mills, foreign-banking and foreign-steamship agencies and editors of foreign-language newspapers reported to the chamber of commerce that 40 per cent of the Slovaks in the city will return home; 30 per cent of the Roumanians; 30 per cent of the Jugo-Slavs; 20 per cent of the Poles; 35 per cent of the Ukrainians and 20 per cent of the Magyars. New York bankers say that it is the consensus of the racial leaders that a proportion as high as 11 per cent of the alien population of the country is determined to leave. Several months ago the savings bank section of the American Bankers' association sent to the bankers of the country a letter stating:

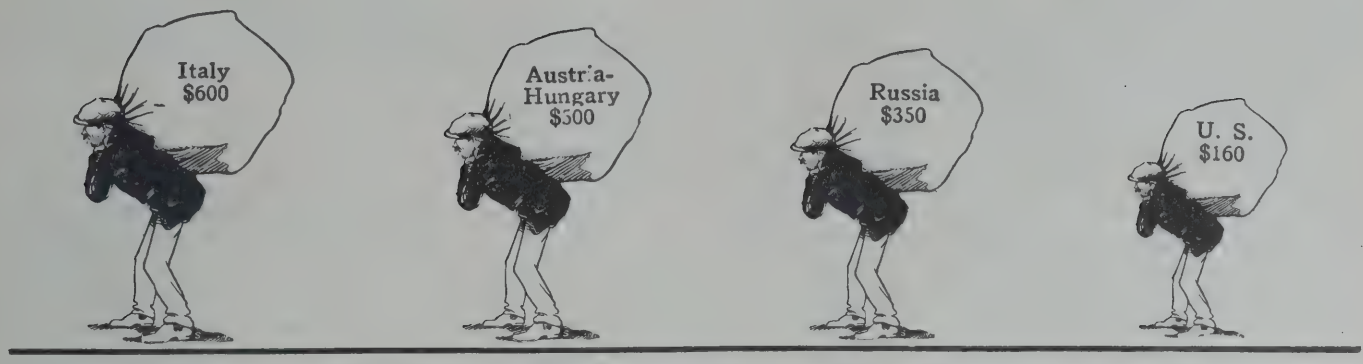
"Due to Bolshevik propaganda an alarming proportion of the 14,000,000 foreign-born aliens are drawing their money from the banks, selling their Liberty bonds and houses and returning to Europe. The New York custom houses authorities announce that those now sailing from this port carry with them from $2000 to $15,000 each in United States currency. It is estimated that about 1,300,000 cannot be stopped from going, and that they will carry with them nearly $4,000,000,000, or four-fifths of the total currency in circulation and in re-

ONE REASON WHY THE ANTICIPATED "EXODUS" OF ALIENS MAY NOT ATTAIN SERIOUS PROPORTIONS

serve in the United States before the war.

"It is estimated that unless vigorous action is taken over 6,000,000 of these aliens may be lured abroad by this vicious propaganda, taking with them cash equal to the total present currency resources of the United States. This is certainly serious."

Another letter, which was also sent to the savings bank officials throughout the country, said that "it is for the purpose of bringing these people and their collective wealth within reach upon their native soil that the most insidious of all the Bolshevik propaganda is being practiced to entice them to return to their mother countries in Europe with the allurement 'sell your Liberty bonds and real estate, draw your savings and bank accounts, return to your native country and enjoy free land, only five hours a day work, no compulsory military service and unrestricted personal liberty.'"



Regardless of the accuracy of estimates of the number of aliens planning to leave our shores there are several reasons why the movement will not prove serious. One is the tax-ridden condition of European countries. The per capita debt is several times larger than that in the United States, and the workman in America will not be slow to grasp the significance of this fact. He realizes, or will realize when he has heard from the old country, that it is not to his best interest to rush "home" and give a large share of his earnings to pay the debt piled up by the war, merely to satisfy his curiosity, when he may remain in the United States, where his employer contributes so largely to paying off this country's obligations. He realizes that over here work is plentiful, and that he receives the highest wage in the world paid to a man of his ability. These conditions will out-

Not all the aliens going home are leaving of their own volition. This shows the embarkation of "undesirables" at Charleston, S. C.

A great number of aliens arriving are commercial travelers and business men. The proportion of laborers and skilled workmen is small

THE PER CAPITA DEBT OF EUROPEAN COUNTRIES IS AN ARGUMENT FOR ALIENS TO REMAIN IN THE UNITED STATES

weigh purely sentimental reasons for his going abroad, or remaining there if he does.

EMPLOYERS and civic bodies are likely to be heard on the subject of suspending immigration when the house committee on immigration begins consideration of the bills now pending. Local chambers of commerce have been making surveys and forwarding data to the Chamber of Commerce of the United States. That body has not taken action in regard to any of the bills introduced in the house, but it is understood that the consensus of opinion among the members is that the legislation should be limited to the exclusion of undesirables. This opinion, it is said, is not based on any selfish grounds and does not proceed from any purpose to antagonize the American Federation of Labor, which is seeking to erect a barrier against foreign labor, but is based on the conclusion that if we are to increase our industrial operations we must have more men with which to do so and that it is contrary to American principles to shut out the honest law-abiding alien who seeks to establish his home in this country.

Aliens in New York waiting to pay their income taxes and obtain their passports. Similar lines may be seen in other large cities

Aliens in Chicago are here seen waiting to withdraw their savings deposits. Many going abroad are leaving a portion of their money in this country

The National Federation of Construction Industries, Philadelphia, is now taking a poll of its members to determine their attitude on the question. The questions set forth on its ballots are:

Do you believe that the present immigration laws, as amended at the last session of the congress, with provisions for stringent literacy tests, ought to be given an opportunity for trial before further legislation is enacted?

Do you feel that with the marked emigration of labor, which has been going on during the past few months, it would be desirable to amend existing legislation to eliminate, or make less stringent, literacy tests?

Do you feel that it would be

desirable for legislation to be enacted which would stop all immigration for a period of three or four years,

Are you now experiencing a labor shortage, either skilled or unskilled?

Do you expect that you will have a shortage of labor in the near future?

Compromise Measure Submitted

The last bill introduced in the house, Aug. 20, by Representative Johnson, of Washington, chairman of the house committee on immigration, was prepared as a compromise, to represent the composite views of the members of the committee. It bars for two years all aliens except travelers, students, professional men, steps to become a citizen of the United States.

An alien will not be entitled to citizenship unless he has continuously resided in the United States five years. If within one year from the date when he is first entitled to the privilege he fails to become a citizen he will be deported. An alien who fails to register is also subject to deportation.

On May 19, Representative Johnson introduced his original bill to suspend immigrations for two years and to deport "any alien who believes in, practices, advocates, teaches, sanctions, or encourages the extortion of money or property or avenging grievances through threats of bodily injury or injury to property, or is a member affiliated with any organization that so practices . . . "

Would Require Registration

This bill proposed that within one month after it became effective all aliens be compelled to register. They would be required to register thereafter semiannually and renew their certificates of identification for four years. It was proposed to charge a fee for registration and the issuing of certificates, the fees to be reduced as the registrant submitted proof of his ability to read and write the English language and the acquirement of a "fair knowledge" of the American form of government. No fee would be charged after the alien became naturalized. The bill also provided for the provisional admission under bond of certain aliens whose records the government might desire to investigate.

Proposes to Limit Immigration

A bill was introduced by Representative Dillingham, Aug. 15, limiting the admission of aliens to 5 per cent of the number of their nationality already resident in the United States.

Representatives Raker and Lufkin introduced bills proposing to suspend immigration for four years, and Representative Harrison submitted a bill

skilled labor and aliens who departed to aid the allies. Those who are admitted must make affidavits and procure passports. After the termination of the period of suspension an alien will be admitted when he has sworn to a statement:

That he is coming to the United States for the bona fide purpose of becoming a citizen.

That at the earliest possible moment he will learn the English language and become acquainted with the form of government and the institutions of this country, and that he will obey the laws.

That he will register once each year until he becomes a citizen with the county clerk of the county wherein he may reside, or with an immigration officer designated.

That he understands and agrees that he may be deported for failure to register or to take the necessary

increasing this to five years. Other bills have been introduced to deport those aliens who proved disloyal to the United States during the war, or who refused to fight for the United States on the ground of noncitizenship.

From the number of bills introduced it is evident that the United States is going to be more particular in the future as to what goes into the "melting pot." The literacy test, it is said, has not safeguarded the interests of the United States as fully as present demands require. The drawback to that legislation is that it has served to keep industrious men out of the country while offering no barrier to those of limited intelligence but infinite capacity for doing wrong.

So far as concerns the suspension of immigration, President Wilson has not expressed himself to congress, but he has most emphatically declared in favor of continuing war-time restrictions against the admission of aliens with evil purposes. The exclusion of the criminal classes has been adopted as a national policy, but on the question of suspending all immigration there is much difference of opinion.

"Two versions of the immigration situation have been presented to our committee," says Representative Knutson, Republican whip, and a member of the immigration committee.

"One was that European countries, especially those in which fighting took place, will need the service of every able-bodied man in the task of rehabilitating the devastated regions. This demand should create working conditions and such attractive wages as to induce the workers to remain in their native lands.

"The second theory was that because of unsatisfactory living conditions in Europe there will be a tremendous exodus as soon as transportation facilities make it possible.

"Commissioner Howe originally took the first view of the situation. According to some of his more recent articles, however, he has revised his opinion and now expects to see our immigration stations jammed with applicants unless congress decides to impose restrictions.

"As to the attitude of our committee, the majority members take the view that it is up to us to report out legislation that will prevent a glutting of the American labor market. I think a temporary period of suspension of immigration will be the inevitable result. This period may be fixed at two to four years."

A double barrier may be erected against the Europeans who may wish to come to the United States. England, France, Italy and Germany have taken measures to keep their workmen home. Laws, either proposed or in process of enactment, have been supplemented with associations to procure work and induce men to remain. In May there was started in Germany the Reichastelle fur deutsche Answandrung und Ruckwanderung to work for the return of Germans now in other countries. All of these efforts combined with the increasing amount of work provided in foreign countries will have some effect in limiting immigration at least within the next few years, regardless of what action congress may take.

GOODBYE!

Every steamship bound for Italy is crowded with passengers. Here is a typical crowd aboard the steamer Caserta, which sailed July 15

Cleveland Engineers Meet

Approximately 175 northern Ohio engineers attended the first of the 1919-1920 series of joint meetings of the Cleveland section of the American Society of Mechanical Engineers and the Cleveland Engineering society, Tuesday, Sept. 9.

At the opening session, held at 10 a. m. in the Hotel Cleveland, Conrad Hibbeler, Mercury Mfg. Co., Cleveland, explained the use of tractors for transporting materials in industrial plants, warehouses, etc. His talk was accompanied by two reels of moving pictures showing the construction of tractors in the plant of the Mercury Mfg. Co., and their performance in several branches of industry. W. E. Pease, Cleveland & Youngstown railroad, Cleveland, outlined the proposed plans for establishing a new freight and passenger railroad, interurban and local electric line terminal in Cleveland. By means of slides, he showed the development of the new rapid transit system which now is nearing completion.

From the hotel, the engineers were taken over the new rapid transit line to the Shaker Heights Country club where lunch was served. The afternoon was devoted to an inspection of the engineering features of the transit and terminal development. Following a dinner at the Hotel Cleveland in the evening, Dr. Willis A. Moore delivered an address, "Doing the Impossible," and O. M. Smart, trade commissioner, United States department of commerce, Washington, spoke on "Commercial Conditions in Europe."

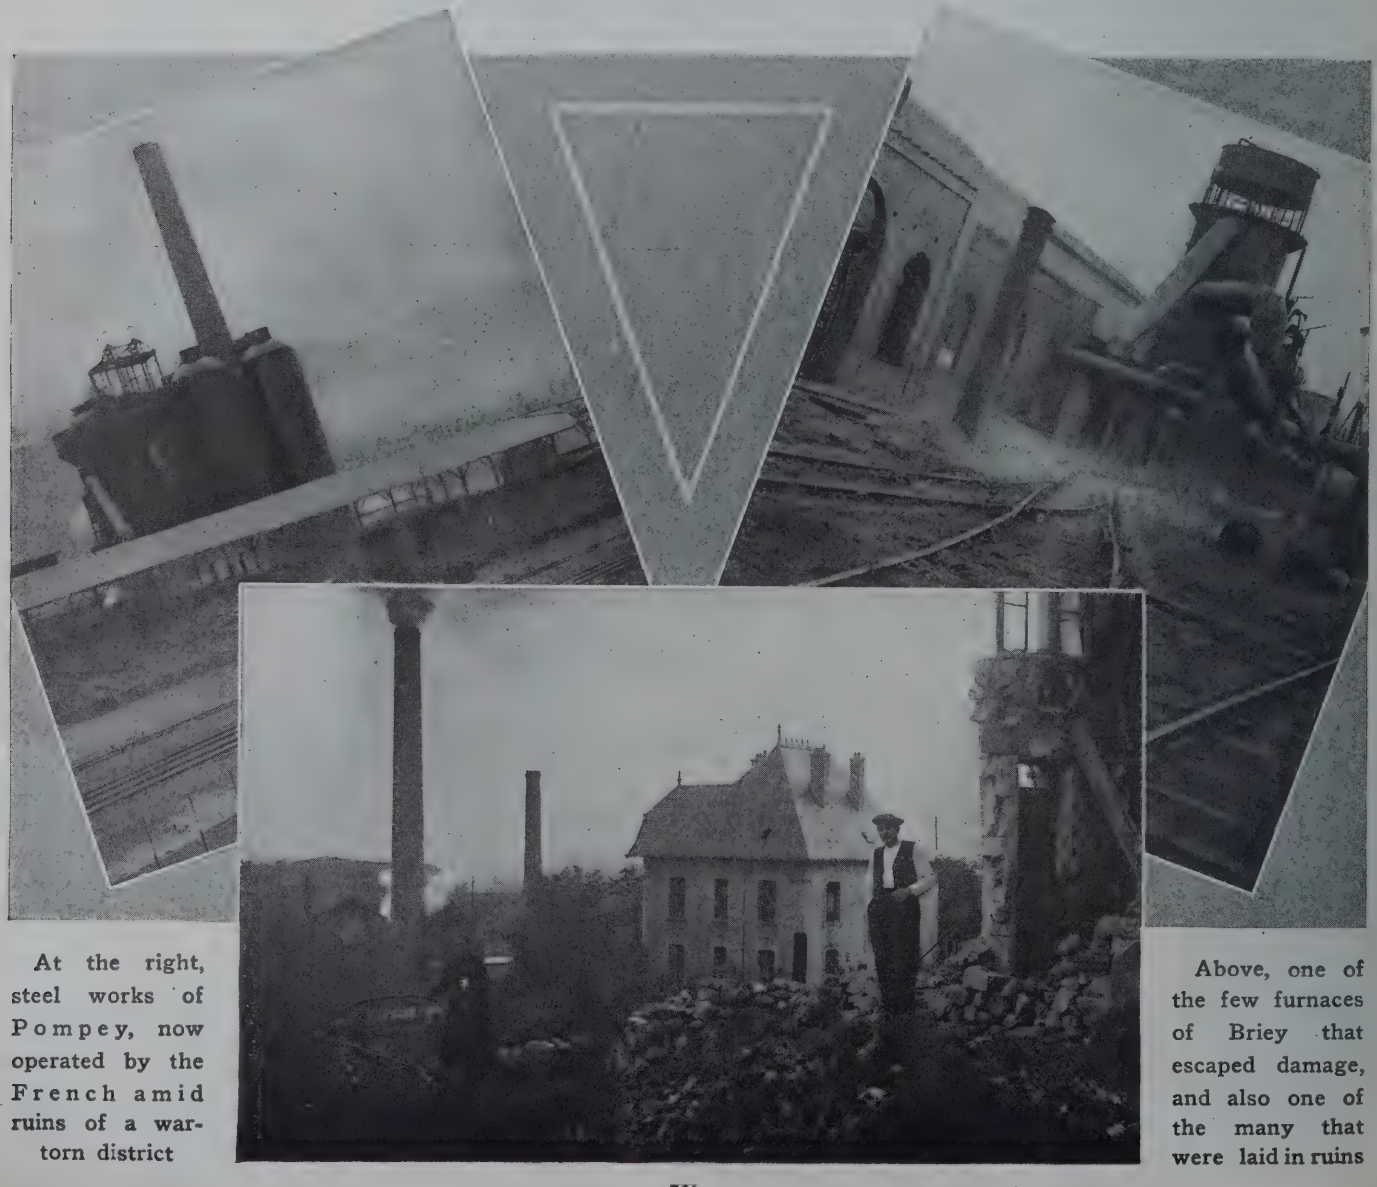
The Bethlehem Fabricators, Inc., Bethlehem, Pa., have completed a new fabricating shop, 60 x 280 feet, which, when completely equipped, will give employment to 150 additional men. At present the company's force numbers 200.

French Industry Moving Slowly

Labor and Transportation Problems and Shortage of Coal and Coke Put Heavy Burden on Owners of Steel and Iron Works — Large Tonnage for Reconstruction of Bridges in France Goes to German-Owned Thyssen Plant

BY FRANCIS MILTOUN

Paris Correspondent of The Iron Trade Review



PARIS, Aug. 18.—Production in the iron and steel trades in August has not improved much over what it was some months ago, because the labor and transport situations are still acute. Beside, there is the problem of obtaining sufficient coal. No supplementary licenses can be had in England for the exportation of coal to France, while Belgium states that she can only supply France with any excess above her own needs, which for the present are insistent.

Certain qualities of Belgian coal notably those for gas making and generators are not permitted to be exported. It is feared that Belgium also will soon restrain the export of coke, in view of the needs which its own iron and steel industries promise to have for its limited supplies. This would seriously affect the operation of French blast furnaces and foundries. As a solution of the problem it is proposed to compel Germany to make up the deficit in French requirements. Energetic pressure is urged for the strict observance by Germany of the coal clause in the peace treaty.

The transport problem affects all other industries. Only on two of the seven great trunk lines of France is service approximating normal. On the Nord and Est railroads, precisely where there is need for intensive traffic, the situation is still chaotic.

Coke for industrial use is about to be increased 50 per cent, when obtainable, making the price of washed coke 150 francs a ton. All metallurgical products of France will have to be advanced to meet this extra cost.

Reconstruction of French blast furnaces is proceeding slowly. In the

At the right, steel works of Pompey, now operated by the French amid ruins of a war-torn district

Above, one of the few furnaces of Briey that escaped damage, and also one of the many that were laid in ruins

Longwy region, out of 36 furnaces which existed before devastation by the Germans but two are now in operation, one as a dependent of Senelle-Maubege and the other of the Providence-Rehon plant. Senelle-Maubege has, in addition, another furnace in course of construction. The production of this region is now but 320 tons of pig iron a day, whereas before the war it was 4670.

In the region of Nancy and in contiguous eastern France six blast furnaces are in operation, producing 510 tons per day. Another blast furnace is operating at the Marine et Homecourt plant, two at Micheville, two at the Montataire plant at Frouard, two at Pompey, while the Micheville stacks in Champagne are also lighted.

Notable effort at production has been made at the Acieries de la Marine et Le Boucau, where three furnaces have been lighted, one at Alais, two at the plant of the Society Metallurgic of the Ariege, five at Commentry-Fourchambault, two at Perigord, one at Allevard in Dauphiny, one at the Saut du Tarn and three at Creusot.

Production in the steel plants likewise has been handicapped for the reasons stated. To help out the labor situation recourse has been had to imported Italian labor, as was the custom in the shipyards and machine shops of southern France before the war. The lack of rolled bars and sheets is being felt more and more. Wire is imported almost wholly from America at present, and the French wire mills, not being able to use their plants, are protesting.

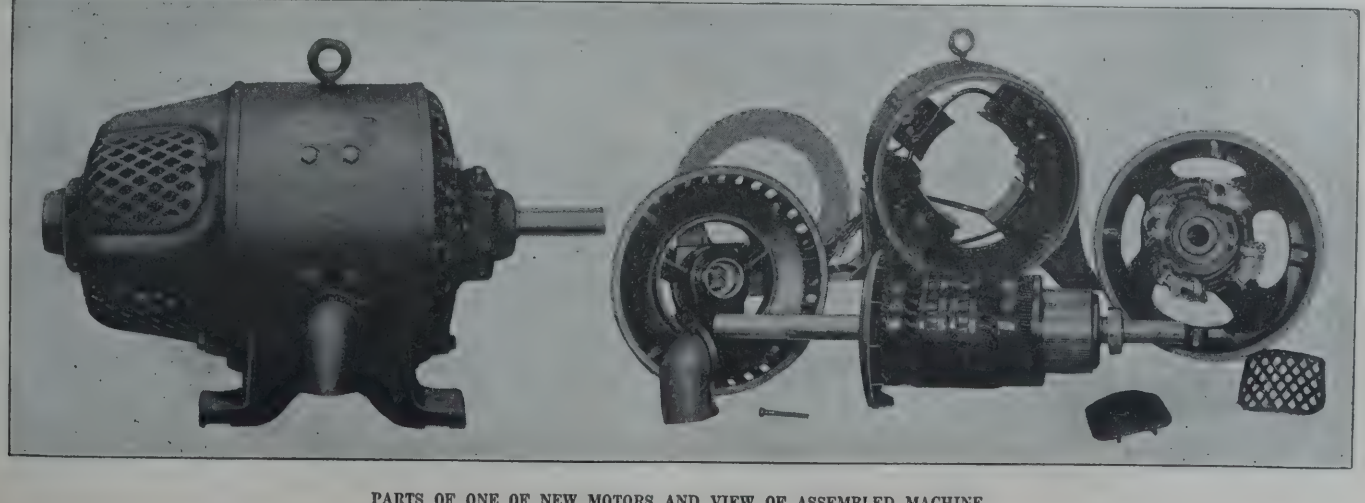
A curious epitome of the situation is that the Thyssen plant at Haganodange, now under sequestration, has received an important order for bridge girders for bridge reconstruction on the main line of the Nord railroad, from Paris to the North. The situation in Lorraine, now French again, is improving. While the extraction of ore in the basins of Briey, Landres and Crusnes has been comparatively feeble it has reached 600,000 tons a month, about a third of the rate of production before the war. Approximately the ore is being distributed as follows: 300,000 tons to Lorraine plants, 100,000 tons to Luxemburg, 100,000 tons to the Saar and 100,000 tons to non-occupied Germany.

Steel production in Lorraine, though manifestly low, is nevertheless amounting to a respectable tonnage, all things considered. The steel plants are finding their chief markets in Belgium and Switzerland, each of them countries where the working up of semifinished material has ever been a source of profit.

Luxemburg foundry iron is quoted as follows, on cars within the duchy, the basis of exchange being 7 francs, 60 centimes to the dollar: No. 1, 245 francs a ton; No. 2, 235; No. 3, 230; No. 4, 220; hematite, 250. Swedish iron, not exceeding .20 to .30 per cent silicon, is offered laid down at Rouen at 385 francs a ton.

On Aug. 1 Lorraine ore was increased in price 3 francs a ton, ore on cars now selling at 15 francs.

New D. C. Motors and Generators Developed



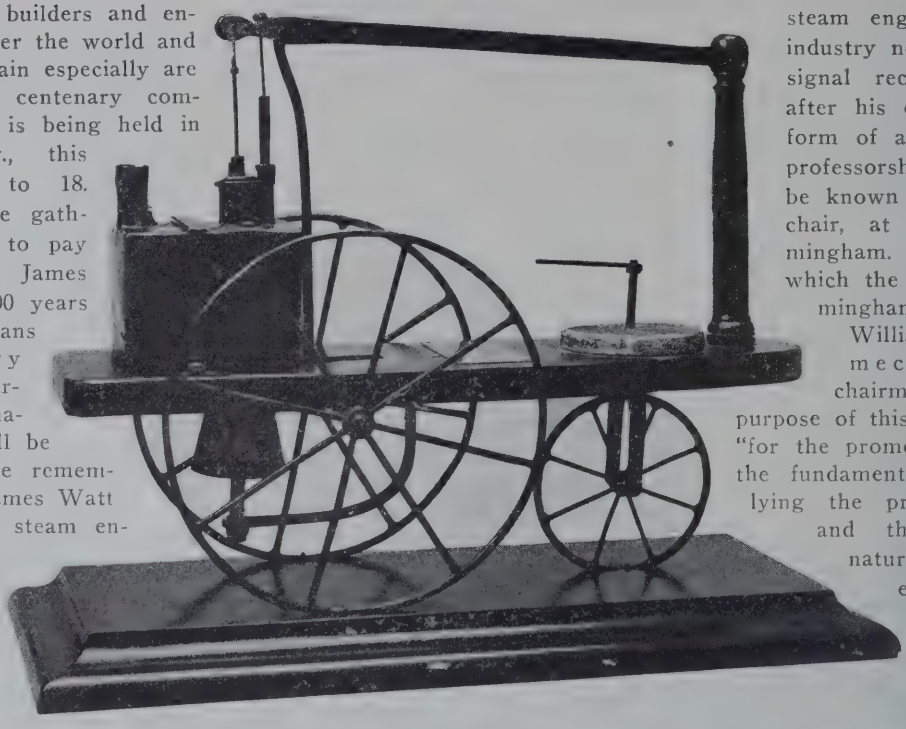
A new type of commutating-pole, direct-current motors and generators, has just been developed by the Allis-Chalmers Mfg. Co., Milwaukee, and is said to embody many details which contribute to accessibility, reliability and safety. Machines of standard ratings have been designed throughout; the motors ranging in size from ½ to 50 horsepower and the generators from ½ to 40 kilowatts.

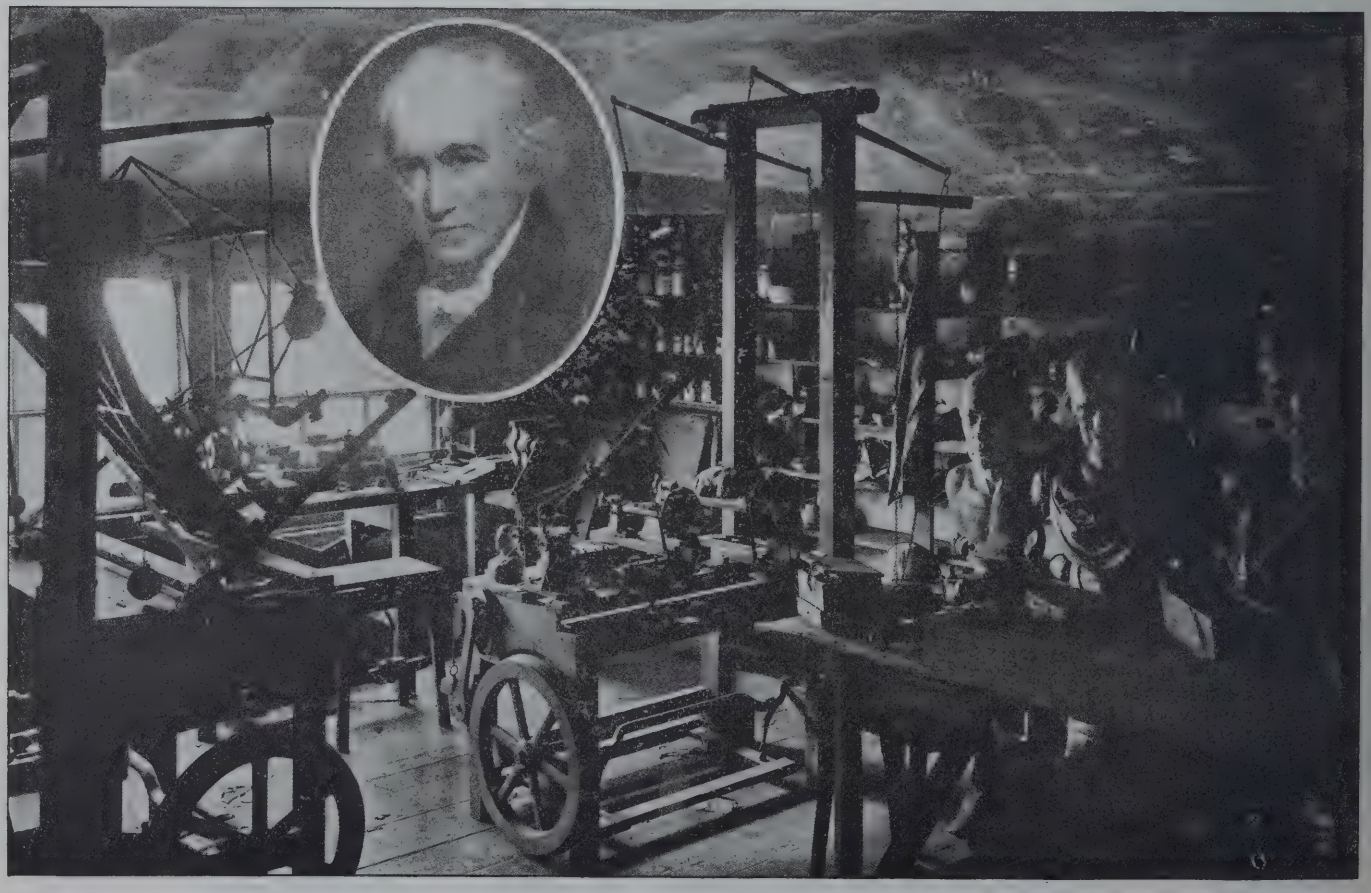
The constant speed motors have the same rating and speed of 60-cycle induction motors and can be used interchangeably with induction motors for direct-connected applications without changing the method of drive or the ratio of gearing. The adjustable speed motors, intended particularly for machine tool and similar applications, are provided for 2:1, 3:1 or 4:1 speed range. The generator speeds also correspond to those of induction motors, thus permitting the direct coupling of the machines to form motor-generator sets in various combinations.

Cast steel yokes are used in machines of the larger ratings while the smaller machines, which are of the bipolar type, have riveted frames. The accessibility of the commutator is indicated in accompanying illustration. Protecting grid covers can be provided for these openings in the front bearing bracket and may be attached readily even to a machine in service. Solid covers are used with completely enclosed motors, the rating of these machines being somewhat lower than that of the open or semi-enclosed motors.

All machines have ring-oiling, dust proof bearings, while the windings are treated to resist oil and moisture. The conduit terminal boxes have removable covers to afford access to the terminals. Box type brush holders are adjustable for tension and suitable for rotation of the armature in either direction. Each holder can be removed independently with a screw driver or wrench.

The armature core has the laminations riveted together, permitting the removal of the shaft without dismantling the core or commutator while with the 20-horsepower and larger machines, the core and commutator are built on a sleeve so that the shaft can be pressed out of the finished armature without disturbing the windings. An air ventilating system is an important feature of this machine. A fan mounted on the rear armature head causes cool air to flow in through the liberal ventilating ducts and to take up the heat from the iron and windings.





PARTS OF ONE OF NEW MOTORS AND VIEW OF ASSEMBLED MACHINE

Britain Holds Watt Centenary

Distinguished Company of Engineers Gathers at Birmingham, England, to Honor James Watt Who Died in 1819, Having Perfected Steam Engine and Other Inventions—Will Erect Permanent Memorial

STEAM engine builders and engineers all over the world and in Great Britain especially are interested in the centenary commemoration which is being held in Birmingham, Eng., this week, Sept. 16 to 18. Many of them are gathered in that city to pay their respects to James Watt, who died 100 years ago and if the plans of the centenary committee are carried out, an international memorial will be erected. It will be remembered that while James Watt did not invent the steam engine, he so improved an imperfect and wasteful machine that it became the powerful and economical steam engine with which all industry now is familiar. This signal recognition, 100 years after his death, will take the form of an endowment for a professorship of engineering, to be known as the James Watt chair, at University of Birmingham. The committee, of which the lord mayor of Birmingham is president and William Mills, leading mechanical engineer, chairman, states that the purpose of this endowment will be "for the promotion of research in the fundamental principles underlying the production of power and the conservation of natural sources of energy." This committee also proposes to erect a James Watt memorial building and pub-

JAMES WATT AND HIS GARRET WORKSHOP AT HEATHFIELD HALL. ABOVE, EARLY TYPE OF STEAM ENGINE

How Strike Was Settled at Watt Plant in 1791

DATED March 23, 1791, and written to James Watt, No. 6 Green Lattice lane, Cannon street, London, from Soho by his business partner, Matthew Boulton, the following report indicates that strikes and labor disturbances were not lacking 128 years ago. It also indicates that reasons for strikes then were no more fantastic than at the present time. The strike about which Mr. Boulton reported and with which he successfully coped seems to have been called because the men wanted time off in the afternoon in order that they could drink their ale comfortably. The letter, which is preserved by Tangyes, Ltd., refers to the burning of the Albion mills near London bridge and the offer of $2500 reward (never successfully claimed) for the name of the incendiary and continues:

"Last night a commotion arose amongst all B. and W. enginesmiths and other workers but as I found they were drunk before Mr. Foreman informed me and as it's in vain to reason with drunken men I waived facing them until this morning. They all struck, viz., grounded their arms at 5 o'clock yesterday and appeared riotous this morning. At 10 o'clock I met a deputation from them in Mr. Foreman's rooms, from which I learnt that they had entered into three resolutions which I put down and then said I hoped they would allow me to enter into three resolutions, which I also put down and read to them and they agreed they were fair and just. I then met the main body below and went over the same ground I had done with their deputation and after reading their resolutions, read my own and promised them upon my word and honor that I would never depart from them be the consequences what they may. They swallowed all their own resolutions and said they would set to work if they could be allowed to drink their ale comfortable in an afternoon. I agreed to allow the hard-working smiths half an hour and as they expressed a wish for peace, I forgave them all except Joe Turner whom I assured I had marked and if you had been at home I would have turned off for I am persuaded I could get his work done for nearly half his price. He was the ring leader in this rebellion and in former ones. I read the resolutions twice over to them."

The two sets of resolutions which form a part of the letter are as follows:

At a general meeting of the enginesmiths:

RESOLVED FIRST, that if any man set to work in B. & W. shops, he shall be discharged and until he is, no man shall set to work.

RESOLVED SECOND, if B. & W. turn anyone away in consequence of this commotion, all the rest are resolved to strike.

RESOLVED THIRD, we insist upon having one hour allowed in the afternoon for refreshment, otherwise to leave work at 6 o'clock.

Mr. Boulton resolved on the part of B. & W. and pledged his word and honor for abiding thereby:

RESOLVED FIRST, that I will not consent to allow the old accustomed hours of all Birmingham manufacturers (except so far as to allow such of the enginesmiths as work hard, half an hour to refresh in the afternoon and no more).

RESOLVED SECOND, that we will employ whom we think proper and turn away whom we think proper and will not be dictated to in these respects by any of our workmen.

RESOLVED THIRD, as to those who work piece work, may work only half days if they please. But if they neglect our business we must get others in their place, and as to those who work day work, we have a right to our time and customary hours and will on Saturday nights stop for all deficient hours.

lish an appropriate memorial volume.

The building will serve as a meeting place and library for scientific and technical societies and from this center, engineers will co-operate in dispensing scientific knowledge. Because a large sum of money will be required for these purposes, the committee now is soliciting subscriptions and already has received contributions of $5000 each from the Birmingham Small Arms Co., Ltd., and W. & T. Avery, Ltd. Some plan is to be perfected to keep all subscribers to the memorial informed of the progress of the research carried out under the professorship.

Tuesday, Sept. 16, was devoted to the registration of visitors in the morning and a memorial service and

HEATHFIELD HALL, NEAR BIRMINGHAM, ENGLAND, THE HOME OF JAMES WATT FROM 1790 UNTIL HIS DEATH IN 1819. SINCE 1876 IT HAS BEEN OCCUPIED BY GEORGE TANGYE

garden party in the afternoon at Heathfield hall, which was the home of James Watt from 1790 until his death in 1819. Through the courtesy of George Tangye, who has lived there since 1876, the visitors were shown the garret workshop of Mr. Watt, in which everything remains virtually untouched and as he left it. In the evening a reception was held at which a number of lectures were delivered. These were continued on Wednesday and visitors were taken to see an early type of the Watt engine, working under steam at Ocker Hill, near Wednesbury, about six miles from Birmingham. This engine originally was erected in 1776 at Smethwick for the Birmingham Canal Co., and is the earliest pumping engine built for sale by Boulton & Watt. It was working regularly until 1892 and was re-erected in 1898 in its present location. Visits also were made to another Watt engine at Bordesley, about a mile from the center of Birmingham, and to the Soho Foundry, formerly occupied by Boulton & Watt, now operated by W. & T. Avery, Ltd., where some of the original buildings erected by Messrs. Boulton & Watt were seen. Here too was viewed the first gasholder ever made, an invention of William Murdoch, whose entire business career was spent at Soho works which were first lighted by gas in 1802. Mr. Murdoch also was first to introduce the use of compressed air for the distribution of power. In the evening of Wednesday the centenary dinner was held, with a large attendance of distinguished engineers.

On Thursday, those in attendance were taken on excursions to various points of historical interest in the neighborhood of Birmingham, including Stratford-on-Avon, Warwick, etc., and the visits to the engines were continued. One of the interesting features of the commemoration is the large collection of Watt, Boulton and Murdoch relics, including those presented in 1915 to Birmingham by George Tangye.

Watt's Career Most Interesting

Since the steam engine has had a greater effect in the evolution of modern industrial life than perhaps any other single influence, the life of James Watt, who was the pioneer in the steam engine's development, holds much of interest. Born in Greenock in 1736, Mr. Watt commenced his business career as an instrument maker, being employed in that capacity by the University of Glasgow. There he was led to the study of the steam engine while repairing a model of a Newcomen engine. Noting how wasteful it was in the consumption of fuel, he studied the properties of heat and soon discovered that the great defect of the Newcomen engine lay in the injection of water into the cylinder. This led to the invention of the separate condenser, with which his name will always be associated. As usual the early days were fraught with discouragements and disappointments but in 1774 he became affiliated with Matthew Boulton and the following year a partnership was formed which lasted a quarter of a century. In 1776 began a series of successes with their engines on which their patent had been extended for 25 years. Many times when Mr. Watt became discouraged and depressed with the responsibilities and financial worries which always beset a firm promoting a new industry, Mr. Boulton would shoulder them and his abounding cheerfulness brought them through. His belief in the genius of Mr. Watt never was shaken and in 1800 Mr. Watt retired from the firm.

The first engines of Watt mainly were used for pumping in Cornwall, where the deepening of the mines made an economical source of power essential. It was not until nearly 10 years after he settled in Birmingham that the first rotating engines were produced. He adopted the sun and planet motion and the rotative engine at the Albion Flour Mills, London, and another at Whitehead's Brewery, that city, were really the commencement of the use of steam power for industrial purposes. The use of the independent valves for the admission and exhaust of steam, the slide valve, the governor, the indicator, all found their inception in the brain of James Watt. When he retired in 1800, the steam engine possessed practically all the features it has at the present time.

Indicative of Mr. Watt's scientific ability, it is conceded that he discovered and stated the composition of water although he did not prove it by experimental methods. This was reserved for Vavendish at a later date.

From 1800 when he retired from business life until 1819 when he died, James Watt spent all his time in scientific and mechanical pursuits. His workshop in the garret of Heathfield hall is preserved as he left it, with all his tools in good condition. Between the stair rail and the door is a block of wood like a small shelf. On this food was left by the servant so that the inventor might not be interrupted. Sometimes it was eaten; more often not. On the table inside the room are three busts; the one in the middle is considered the best likeness of Watt extant. It was executed by Chantrey in 1818, one year before his death. The bust on the left also is of Watt by Turnerelli in 1807. The third bust, on the right, is of Sir John Rennie, also by Chantrey.

Other Evidence of His Genius

The illustration of the Watt room, reproduced herewith does not show the stove which Watt used. Like everything else in the room, it has not been disturbed and the cinders of the last fire burnt in it, remain in the grate and on the top of it in a little crucible, are the ashes of Watt's last assay.

In a large nest of drawers are preserved numerous small inventions, unconsidered trifles, odd bits of metal, nuts and screws, scraps of wood, mathematical instruments, etc. Watt invented the metal pen, delivering a mighty blow to the quill trade and revolutionizing the handwriting of generations to come. Another Watt invention, the copying press, which of course necessitated the invention of copying ink, stands dusty and cobwebbed. Near the window stands Watt's lathe with its lamp and tools as he left them. The machine which stands out prominently in the center of the room is the first copying or medallion machine, which operated on the principle of the pantograph. Instead of a pencil, the Watt machine carried a cutting tool, which bit its way into wood, marble or iron. The machine at the left is of the same type but so constructed that it is not limited to raised surfaces (medallions) but can be used for copying statuary. Watt used to make copies of his own bust and presented them to his friends as the "works of a young artist in his eighty-first year."

Among the interesting things in the interesting room are evidences of the processes by means of which the inventor arrived at the invention of photography upon metal about the same time as Daguerre. Mr. Watt also perfected the process of gilding on china for Josiah Wedgwood.

In one corner of the room is a model of the famous governor or steam regulator; in another is a model of the parallel motion mechanism.

The $1,000,000 plant of the Hastings Consolidated Press & Tool Co., Kalamazoo, Mich., has been purchased by the General Motors Corp.

Special Rig Aids Foundry Output

Four Machines Make Molds With Green-Sand Cores for Tractor Transmission Housings — Floor Space Saved by Pouring as Soon as Molds are Finished, and Shaking Out While Hot

WHEN we consider the advances made in the development of labor saving machinery in recent years, it may seem strange that automatic machinery is not used more extensively in the foundry industry. The explanation for this peculiar state of affairs may be found partly in the fact that a great many castings are individual and are never repeated; others are made only intermittently, and others again are not made in sufficient quantities to warrant the installation of special machinery for their production.

Where similar castings are made in large quantities, however, installations of automatic appliances are becoming more and more numerous and the foundry executives are proving themselves, in this respect, no whit behind their contemporaries in other industrial lines. Indeed, when we consider the many and complex factors entering into the production of castings, it will be admitted that foundrymen are alert and progressive to take hold of all mechanical means to advance their work.

Under ordinary circumstances it is necessary to provide floor space and to stock a sufficient number of flasks to accommodate all the work made for each day's cast. One of the first problems therefore, which confronted those who wished to secure a larger output in a given length of time was to find a way of doing so without increasing the number of flasks or providing a larger floor space. The logical solution was to provide a continuous pouring and molding system so that the flasks could be released and returned to the molding floor as soon as the castings were poured. This system is now in operation in most of the foundries engaged in repetition work.

Having satisfied themselves that the system was practicable the foundrymen then directed their energies to devising methods to keep the pouring side of the proposition working to capacity. On plain, straight work this feature presented no unusual difficulties; but on large complicated jobs, those for instance which were completely cored out, special treatment and equipment were required.

A successful method of producing tractor transmission housings entirely in green sand has been designed and patented by S. W. Stoney, foundry superintendent of the Ferro Foundry & Machine Co., Cleveland. It has been installed at the company's plant under the direction and supervision of S. W. Seblin, plant engineer.

This company specializes in automobile castings and has a daily melt of 150 tons. When the tractor transmission housings were first made the interior was formed by one large dry-sand core, made in halves and pasted together. Mr. Stoney improved on this idea some time ago by

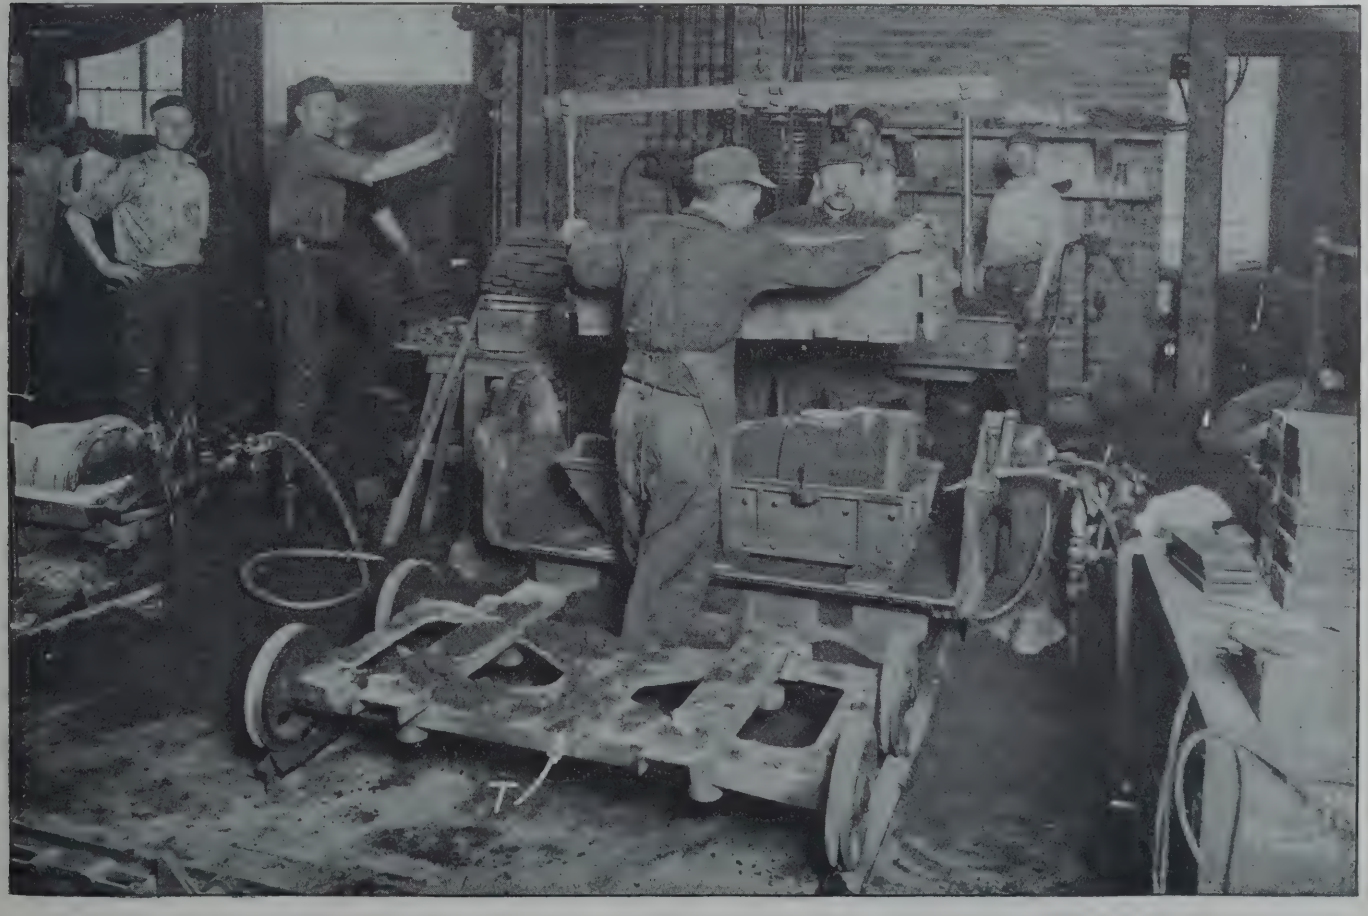


FIG. 1—LOWERING DRAG INTO COPE CORE BOX CONTAINING COMPLETED CORE

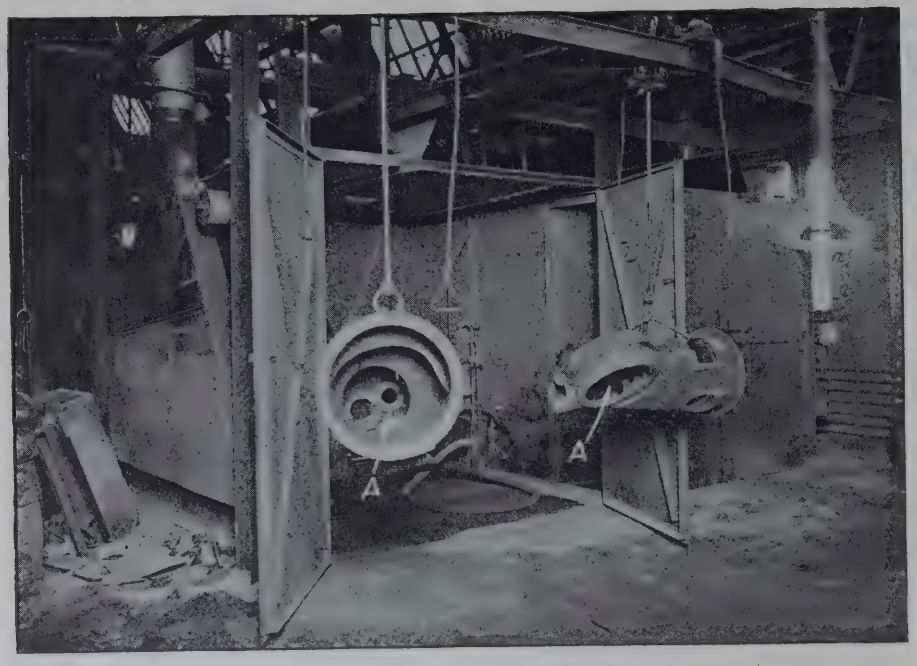

FIG. 2—AT *A* IS SHOWN THE DIAPHRAGM WHICH MADE IT NECESSARY TO PROVIDE A COLLAPSIBLE ARBOR

omitting the dry top core and substituting a green sand top which was *blocked* on thus making a core half green and half dry. From this point it was a natural gradation to the query, "Why not make the complete core in green sand?" The idea seemed feasible and details of a plan for not only making a green-sand core but also of a continuous molding and pouring system were worked out. This system was built and installed in the Ferro foundry and is now in successful operation.

As originally outlined the plan proposed to deliver 200 molds a day, or 400 by working a day and night shift. A comparison of the old and new way will show what an enormous saving in floor space and the number of flasks necessary was effected by the change. The flask measures 3 feet 6 inches by 2 feet, which means that it requires 7 square feet of floor space. Placing the flasks 10 in a row for pouring means 70 square feet in each row. Allowing for 20 double rows and nineteen 3-foot gangways, the total floor space required for the production of 400 molds would be 4020 square feet. In estimating the floor space account must also be taken of the room required to make and dry 400 large cores.

Under the new system the total area required is a space 90 feet by 35 feet, or 3150 square feet, while the number of flasks required has been reduced to 50.

The installation consists of two units of four machines each; a moving platform, level with the floor, extending from the molding floor to the shaking out pit, and a bucket conveyor for carrying the sand back to a central hopper from which it is distributed to the molding machines by a side dump car. A track is also provided on both sides of the floor for carrying the empty flasks from the shaking-out station back

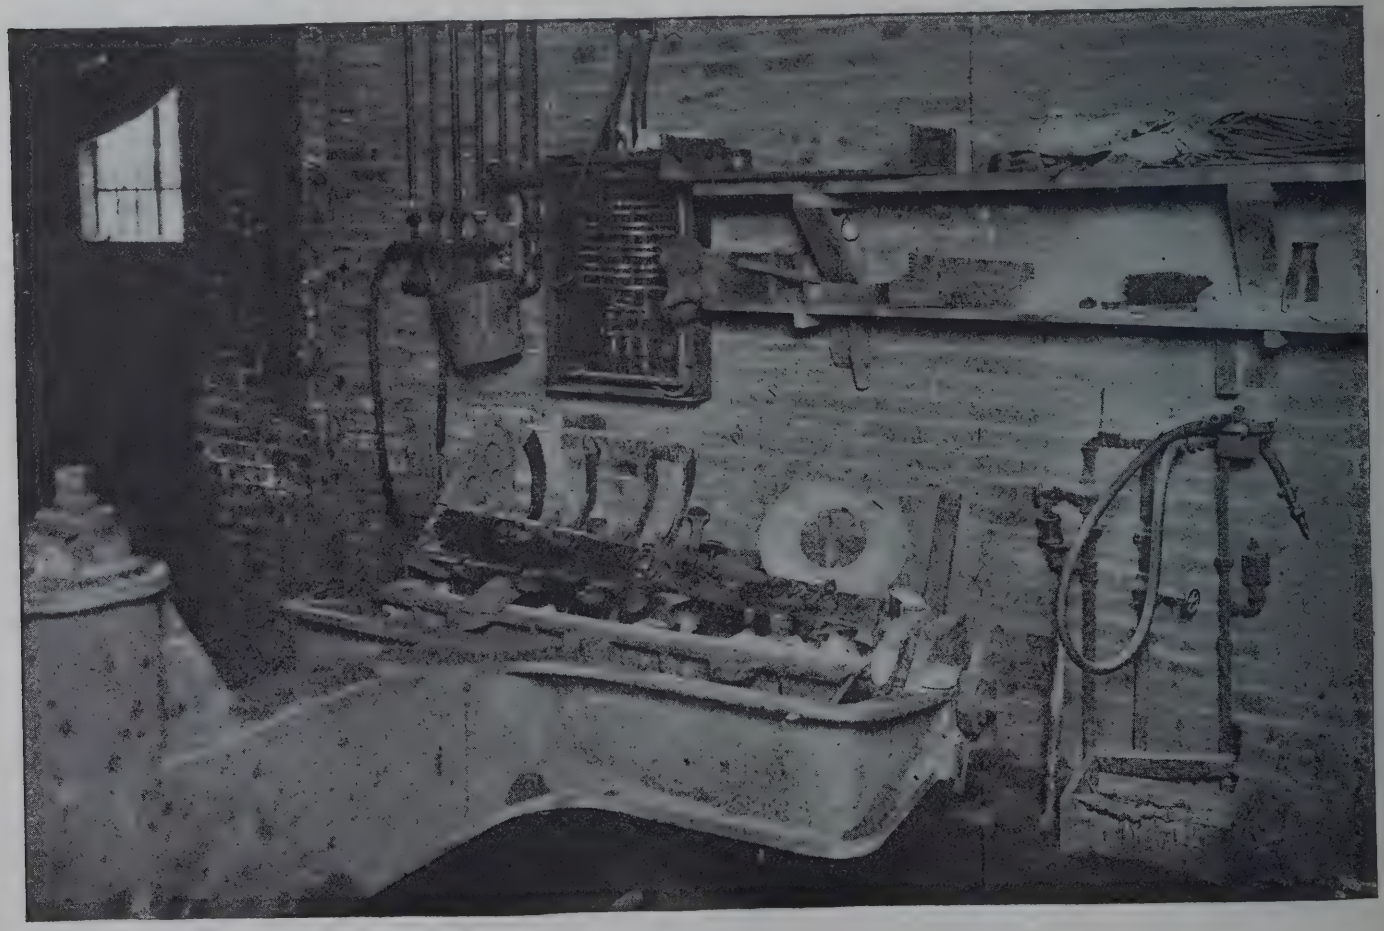

FIG. 3—THE ARBOR ASSEMBLED. ALSO THE ROUND PLATE WHICH FITS IN THE ROUND PRINT IN THE BOTTOM OF THE CORE BOX

to the molding machines. The trucks are mounted on ball bearings and run so easily that one man can push a load of several flasks. Jib cranes carrying air hoists are situated at convenient points for handling the flasks. Each unit is also provided with an electric hoist which runs on a monorail. A Whiting cupola lined to 72 inches has been installed to provide metal for this installation. As each casting weighs 200 pounds, allowing for gates and scrap, the daily melt for 400 molds will be 50 tons. The iron is tapped into a large receiving ladle. This ladle is used for filling smaller ladles which are then hauled over to the pouring floor. An electric hoist running on a monorail serves to pick up the ladle which holds enough to pour three castings.

The flasks used on this job are all interchangeable with the exception of course that the bars in the cope and drag are right and left hand respectively. The joints of both copes and drags are planed and the bottom of the drag is also trued up on the planer so that it will sit snugly on the bottom plate. The sides and ends of the flasks and also the bars are provided liberally with vent holes. The bottom plates are perforated freely with ¾-inch holes. The plates are quite light in section but are reinforced strongly with an exterior flange and several ribs running longitudinally and laterally.

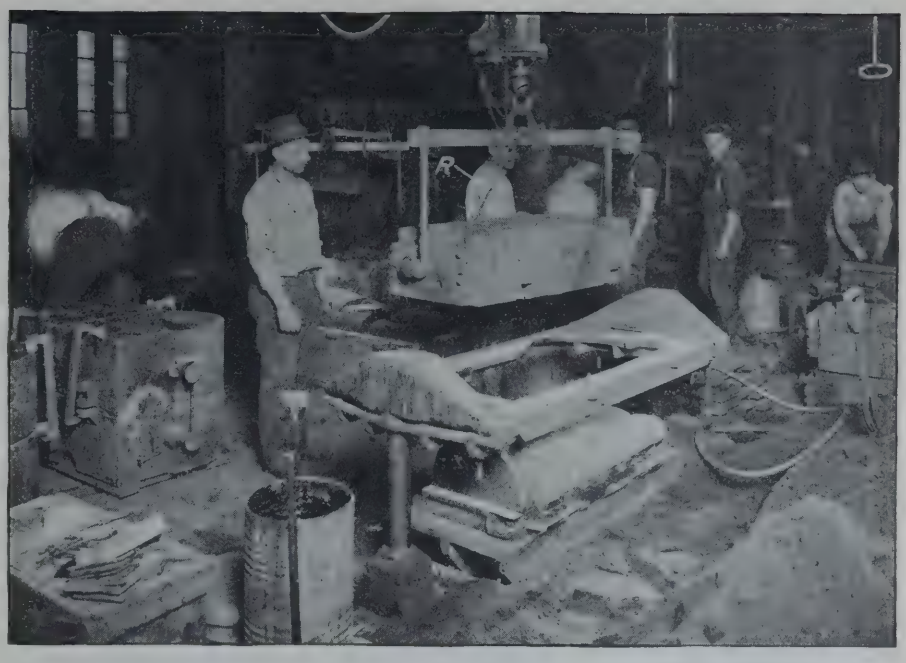

FIG. 4—STRIPPING PLATE MACHINE FOR MAKING COPES. NOTE THE CLAMP *R* TO PREVENT FLASK FROM ROLLING OVER

As may be seen at *A*, Fig. 2, there is a diaphragm dividing the casting into two chambers connected by two small openings. There are also two large circular openings near one end. On account of these features the core arbor had to be made of the collapsible type, so that it may be removed after the casting is poured. One of the arbors is shown in Fig. 3. The main part of the arbor is cast solid. The ends and wings are slipped on before the arbor is placed in the

FIG. 5 MACHINE FOR MAKING COPE CORE IN LEFT BACKGROUND. IT ROTATES AROUND THE CYLINDER *C*. NOTE COUNTER WEIGHTS TO BALANCE THE LOAD

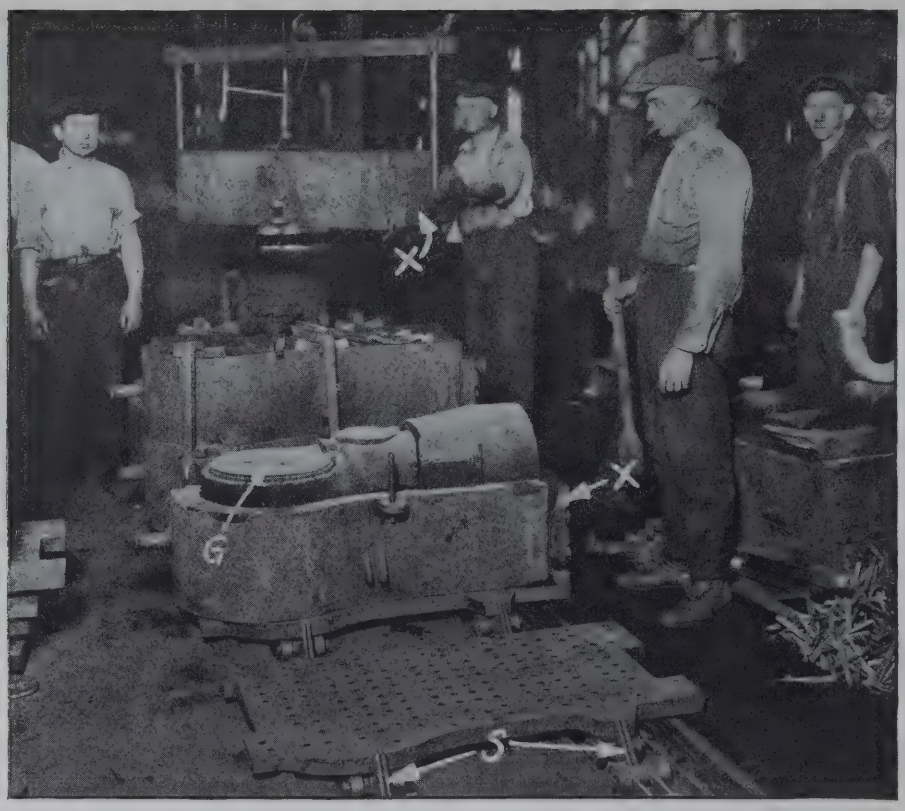

FIG. 6—READY FOR CLOSING DOWN THE COPE. NOTE THE SUBSTANTIAL CONSTRUCTION OF BOTTOM PLATE

corebox. The backbone of the arbor is tapered from one end to the other. Each wing has an opening corresponding in size to the position it is to occupy on the assembled arbor. By this arrangement it is impossible to misplace the wings and it is only necessary to tap them with a hammer to tighten them up. The round plate, Fig. 3, is detachable and serves to carry the sand in the round end of the core. The arbor contains two ¾-inch threaded holes in the lower side which comes in contact with the bottom of the corebox. Bolts are inserted in these holes through corresponding holes in the corebox and are for the purpose of anchoring the core securely while the box and core are being rolled over.

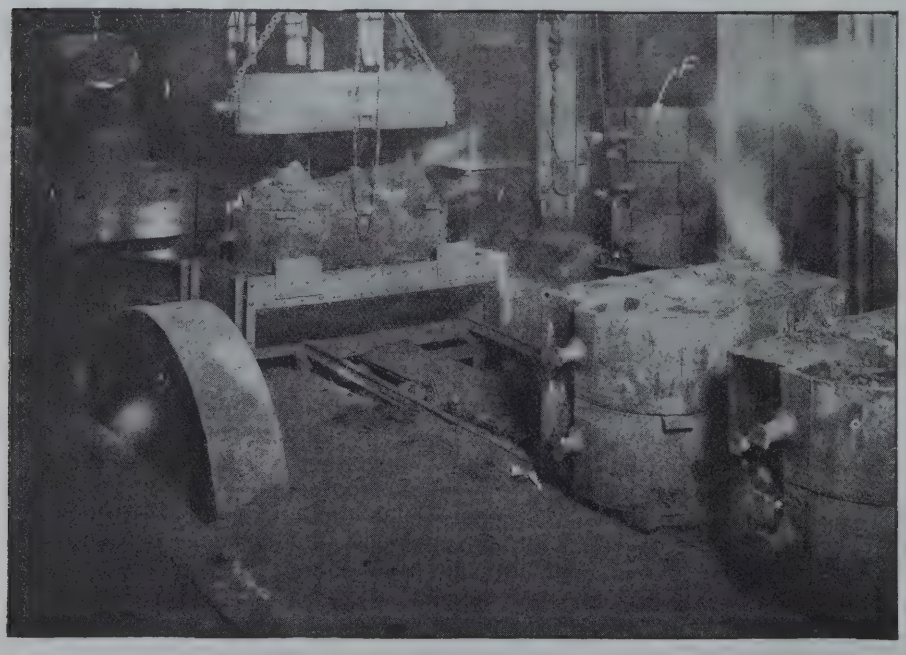

FIG. 7—WHERE THE CASTINGS ARE REMOVED AND THE SAND SHOOK OUT OF THE FLASKS. AT *F* IS SHOWN A LOAD OF EMPTY FLASKS LOADED ON A TRUCK ON THEIR WAY BACK TO THE MOLDING FLOOR

Two sets of four machines are provided for the actual molding of the molds and cores. Each set forms a complete unit. One unit is situated on each side of the central conveyor. The machines are all of the jar-ram type and were built by the Cleveland-Osborn Mfg. Co., Cleveland, with the exception, however, of the machine for making the cope half of the core. This machine possesses several unique features and was constructed by the Ferro Foundry & Machine Co. in its own shops.

The machines for making the copes and drags are identical in operation. One of them is shown quite clearly in Fig. 4. When the flask has been rammed the stripping plate is raised, carrying the flask with it. Then the flask is lifted off the machine and lowered into its respective position, depending whether it is a cope or drag. The machine for making the drag half of the core is shown in Fig. 3. It is provided with mechanism for rolling the box over and subsequently drawing the box off the core. The machine for making the cope core is shown in the left background, Fig. 5. It is the most comprehensive of the set. It embodies some special features incorporated purposely for the installation under discussion. It is a jar-ram machine but in addition to the roll-over and pattern-drawing devices possessed by the drag core machine this machine can be rotated through an arc of 180 degrees horizontally. In the accompanying illustration it is shown raised and 90 degrees from normal position.

A crew of nine men is employed on each unit, two men on each machine, with one man to finish the molds and close them. Another man is employed in assembling the arbors and clay washing them for both gangs.

In ordinary molding practice the drag is made first and set down, then the drag half, or sometimes the whole core is lowered into place; this is followed by the cope after which the completed mold is clamped and poured. The sequence of operations under the new regime at the Ferro foundry is radically different. The cope half of the core is made first, the drag half is placed on top of it, then the drag half of the mold is set on in the position it leaves the molding machine. The drag and completed core are then rolled over all together and then the cope is set on.

Taking the entire operation of making a mold in order and in detail, the sequence of operations is as follows: The cope core is made first. One man sets in the loose pieces, also the cores for making the diaphragm

and brackets shown at *B*, Fig. 6. The other man riddles a thickness of sand into the box and both of them set a number of short rods in the prominent corners to reinforce the sand. Then they fill the box with sand from the heap and one man opens the air valve and jolts the box four times. This part of the core must be left comparatively soft to prevent the iron from *kicking* off it. The sand is butted lightly by hand after which the surplus sand is struck off. The face is gone over with a vent wire after which all the loose pieces are drawn out and any loose particles of sand removed with the air hose.

In the meantime two men have cleaned out the corebox for the drag half of the core. One man sets the loose pieces, also the cores for making the diaphragm and brackets. The flat piece of iron used for striking off the surplus sand is laid over the opening in the diaphragm core to prevent any sand from entering while the green sand core is being rammed. The arbor and lifting plate are then set in and one man riddles on a thickness of sand. The other man sets eight gaggers at strategic points. He also inserts the two screws previously referred to.

The arbor is provided with suitable bearings at each end to fit snugly in the ends of the corebox and later in corresponding bearings in the ends of the flask. In this way an iron to iron contact is assured which precludes the possibility of the core shifting or cutting through. The box is then half filled with sand, the air valve opened and the core jolted from six to eight times. The sand is then finger tucked under the projecting lugs after which the box is heaped up with sand and butted off. The surplus sand is scraped off, the face vented, and the loose pieces of pattern removed. The box is then rolled over after which the bracket rotates and carries the drag core around until it is over the cope core. The drag core is lowered into position, a sprinkle of flour being dusted on first to assure a close contact. The box is rapped, drawn off, and swung back into its former position by the bracket of the machine.

While the cores are in process of making, two men are preparing the drag and cope of the mold on molding machines similar to the one shown in Fig. 4. They are of the ordinary stripping plate type and present no unusual features. The drag machine is located nearest the core machines. When the drag is ready it is picked up by the crane, swung around and

FIG. 8—METHOD OF POURING THE CASTINGS. THE LADLE HOLDS SUFFICIENT IRON TO POUR THREE EACH TIME

lowered into place on the machine which holds the completed core. In other words, the drag is closed down over the core instead of, as in usual practice, lowering the core into the drag. It is secured to the table of the machine by four clamps. The table of the machine is then raised, the load rolled over and the truck shown in Fig. 1 is run in underneath. The table of the machine, which is now in an inverted position, is lowered until the drag touches the floor of the truck; travel is then stopped until wedges have been driven under the cleats of the box in order to hold the mold level while the corebox is being withdrawn. The clamps are released and the table of the machine again raised, carrying the corebox with it. The truck is then pulled out to the end of the short track. The finisher sprays the core with water and repairs any irregularities.

A bottom plate is set on the conveyor so that one edge comes in contact with the stops *S*, Fig. 6. The drag containing the core is set on this plate and as the conveyor carries it past the cope machine a cope is lowered on. The flask is then clamped and the open ends made up to prevent runouts. A false end is attached to the end of the flask for this purpose and is clearly shown at *X* and *X*, Fig. 6. When the mold is closed the space between the end of the flask and the false end is packed full of sand.

The mold is poured through one runner connected to three branches in the round end of the cope core. A strainer core is placed at the bottom of the runner and is shown at *G*, Fig. 6.

The end of the conveyor where the castings are removed and the sand shaken out is shown in Fig. 7. From here the castings are taken to the cleaning room, the sand falls through a grating into a pit from which it is taken back to the molding floors and the empty flasks are loaded on trucks and returned to the molding machines thus completing the cycle of operations.

Invents Steel Skid Leg for Truck Platforms

A new type of steel skid leg for elevating truck platforms, especially designed to support heavy loads, has been developed and placed on the market by the Lyon Metallic Mfg. Co., Aurora, Ill. The skid leg consists of two welded feet which are welded to a steel channel provided with conveniently spaced bolt holes for fastening the leg to a wood or metal top. As shown in the accompanying illustration the leg has rounded corners and a wide bearing surface in order to prevent it from

PLATFORM ON STEEL SKID LEGS SUPPORTING LOAD OF 14,000 POUNDS

damaging floors. The top of the platform is not standardized; it may be made of steel or wood, and in any practicable size. On account of the simple design of the leg and the ease with which it can be fastened to the top, additional platforms, unassembled, can be kept in the stock room, occupying but little space. When a new platform is desired holes can be drilled in one of the reserve tops and the steel legs bolted on, the whole operation occupying but a few minutes.

Furnace Association Meets

A meeting of the Electric Furnace association will be held in Chicago at the Congress hotel, Monday, Sept. 22, the day before the meeting of the American Electro Chemical society. The meeting will open at 11 a. m. with a business session at which formal reorganization, election of officers and other business will be given attention. Following a luncheon for members, there will be a general session devoted to the electric furnace and its products. Several papers will be presented and and the commercial future of the electric furnace industry will be discussed.

Will Dedicate New Experiment Station

MANY mechanical and mining engineers and others interested in the problem of obtaining greater efficiency in the burning of coal will attend the dedication of the new million dollar laboratories of the United States bureau of mines, in Pittsburgh, Pa., Sept. 29, 30 and Oct. 1. A view of the laboratory building is shown in the accompanying illustration.

The bureau of mines, in co-operation with the Pittsburgh chamber of commerce, has prepared an elaborate program of events. The ceremonies proper will open Monday morning, Sept. 29, when the new laboratories, 4800 Forbes street, will be open for inspection. At 10:30 a. m. the dedicatory ceremonies will be held on the lawn in the rear of the laboratories with Dr. Van H. Manning, director of the bureau, presiding. After invocation by Dr. S. B. McCormick, chancellor of the University of Pittsburgh, there will be an address of welcome by Hon. E. V. Babcock, mayor of Pittsburgh. Response will be made by the Hon. Franklin K. Lane, secretary of the interior, to be followed by addresses by Horace B. Winchell, president of the American Institute of Mining and Electrical Engineers, John L. Lewis, acting president of the United Mine Workers of America, and Hon. William C. Sproul, governor of Pennsylvania. The formal ceremony of handing over the keys of the building by Secretary Lane to Director Manning will follow.

Official Program

Monday, September 29

8:30 A. M. Bureau Buildings open for Inspection.
10:30 A. M. Dedicatory Ceremonies in rear of Main Building, 4800 Forbes Street.
2:00 P. M. Special Train and Automobiles to Experimental Mine near Bruceton, Pa.
3 to 6 P. M. Mine Explosion and Inspection of Experimental Mine and of Explosives Testing Plant near Bruceton, Pa.
6:00 P. M. Return by Special Train and Automobiles to B. & O. Depot, Pittsburgh.
8:00 P. M. Informal Meeting and Organ Recital Carnegie Music Hall.

Tuesday, September 30

9 to 12 A. M. Elimination Mine Rescue Contests.
2:30 to 5 P. M. Final First-Aid Contest.
5:00 P. M. Coal-Dust Explosion.
8:00 P. M. Pageant Glorifying the Mining Industry, Forbes Field.

Wednesday, October 1

9 to 12 A. M. Final Mine Rescue Contest.
2:00 P. M. Announcement of Joseph A. Holmes Safety Association Awards.
2 to 5 P. M. Elimination First-Aid Contests.
5:00 P. M. Coal-Dust Explosion.
8:00 P. M. Smoker, with Award of Prizes to Winning Teams.

After luncheon at the bureau of mines buildings, the guests will board special trains on the Baltimore & Ohio railroad to the experimental mine of the bureau of mines at Bruceton, Pa., 14 miles from Pittsburgh. Upon arrival there a prearranged explosion of coal dust will take place in the experimental mine as a demonstration to the visitors and after that there will be an inspection of the mine and the explosives testing plant, the guests returning to the city at 6 p. m. At 8 p. m. there will be a general meeting at Carnegie Music hall under the auspices of the Pittsburgh chamber of commerce.

On Tuesday, Sept. 30, the new laboratories will be open for inspection by the guests the entire day and at 2 p. m. the elimination contests in the national safety first-aid and mine-rescue meet will be held at Forbes field also the awarding of the state championships. At 5 p. m. at Forbes field, there will be a demonstration of the explosibility of coal dust and at 8 p. m. the chamber of commerce will present a pageant typifying the spirit of the mining industry.

On Wednesday the final mine rescue contest and other events, including a pageant in the evening, will be held.

NEW LABORATORY BUILDING, BUREAU OF MINES, FORBES STREET, PITTSBURGH, WHICH WILL BE OPEN TO THE PUBLIC SEPTEMBER 29 TO OCTOBER 1. RESEARCH AND ROUTINE WORK IN THE LABORATORIES WILL BE CONFINED ENTIRELY TO TYPICAL COALS

Coke Bars France's Steel Future

British Official Commission, After Comprehensive Study, Analyzes Main Factors Underlying Changed Iron and Steel Conditions of Lorraine, Saar, Belgium and Cologne Districts—First Copy of Report Reaches This Country

Outstanding Conclusions of British Official Report

FRANCE'S iron and steel development at present is at the mercy of German coal. To remove this menace, French steelmakers hope to trade basic pig iron for British coke and coking coal.

France is a potential competitor of Great Britain in steel in the world's markets but not until the destroyed works have been reconstructed and put in full operation, three to five years hence.

Much new construction was carried on by the Germans in German Lorraine during the period of hostilities. These extensions in partial or completed form have fallen to permanent French possession.

Germany operated some of the French works in occupied territory during the war; attempting unsuccessfully to start others. She stole the equipment and set it up in plants in German Lorraine.

Without Lorraine Germany's modern iron and steel development would have been impossible. Outside France, Germany can obtain ore only from Sweden and Spain. Both need their ore for their steel development.

Germany failed to solve the problem of a shortage of ferromanganese during the war. Calcium carbide which was extensively used proved unsatisfactory, producing unsound steel and a scrap loss of 30 per cent.

COAL and coke are the key materials which will determine the future development of France as great iron and steel power and her ability to compete industrially with Germany, Great Britain and the United States.

Despite her position of great superiority in the possession of iron ore resources and her control of a great number of new works in physical operating condition, France remains a dependent on Germany in the matter of fuel supply. The result is that the Lorraine iron and steel works, now French in name and fact, have been placed in a very unenviable position.

These are the striking conclusions which stand forth in the confidential report to the ministry of munitions by the British commission appointed to examine the condition of the iron and steel works in Lorraine, in the occupied areas of Germany, in Belgium and in France, a copy of which has just reached this country.

This report, which is the most comprehensive by reason of the ground covered by the inquiry and is the fullest in descriptive detail that yet has been prepared on the changed iron and steel situation of continental Europe, represents the results of the official British inquiry into this broad subject. The members of the commission appointed by the British minister of munitions were drawn from among the eminent names of the British iron and steel industry. Those who made a study of Lorraine and the Saar valley consisted of Sir William J. Jones, K. B. E., ministry of munitions, in charge of commission; Percy S. Cooper, Esq., the Partington Iron & Steel Co.; Roland C. Harding, Esq., Robert Heath & Sons, Ltd., and Cosmo Johns, Esq., Vickers, Ltd. Those visiting the Cologne section of Germany, and Belgium, were Dr. F. H. Hatch, representing the ministry of munitions and in charge of the section; L. Ennis, of Messrs. Dorman, Long & Co., Ltd.; James Henderson, of the Frodingham Iron & Steel Co., Ltd., and Richard Mather, of the research department, Royal Arsenal, Woolwich.

The commission was charged with reporting upon the conditions in these districts along several important lines. These were

(a) The character and extent of the technical and other developments that have taken place during the war, with special reference to the steps taken for the development of munitions output.

(b) On the present conditions of plant and machinery.

(c) The prospect of these areas either as competitors with, or markets for, British industries.

(d) The developments in fuel economy in the steel trade of these areas.

The tour of the commission was made during April and early May. The itinerary embraced all the leading steel works in Lorraine, in the Saar valley, in the Cologne district and in Belgium. The report is dated July 19.

MUCH attention is given in the report to the coke difficulties in France. In this connection it is pointed out how the German government has failed to fulfill its obligations to supply France with coke.

"Under the terms of the armistice the German government engaged to deliver 13,700 tons per day of suitable furnace coke, which obligations they have never fulfilled," says the report. "During November and December, 1918, very little furnace coke was supplied; from Jan. 6, 1919, to Feb. 6, 1919, the average deliveries were between 5000 and 6000 tons per day; from early February to the end of March the average daily delivery fell to between 2000 and 3000 tons; since the end of March up to the time of our visit the quantity delivered has been negligible. At the date of our visit only about 500,000 of coke had been received in Lorraine from Germany instead of well over 1,500,000 tons due to have been received or roughly, one-third. Efforts are being made by the French officials to obtain furnace coke from Belgium; the first delivery was made on April 20, but only of 1000 tons. Some of this coke was seen at Knutange and appeared to be of good quality. The minimum tonnage required daily to keep the 60 furnaces in blast in the Lorraine district is between 12,000 and 13,000 tons.

"Only one coke oven was seen in the Lorraine area, namely at Moyeuvres works of Messrs. De Wendel, where there are 105 Koppers ovens installed for producing coke for their

own use. Here is used in the ovens about 75 per cent of Saar coal (from their Petit Rosselle mine in Lorraine, a continuation of the Saar coal field), and about 25 per cent of Westphalian coal; it makes a coke which can be used in the blast furnaces at these works, but cannot stand transportation, being too friable. Some of the coke which we saw appeared to be quite as good as that produced in this country for furnace purposes.

"It is generally agreed that it is necessary to add a minimum of about 25 per cent of Westphalian coal to the Saar coal, as the latter alone is not a strongly coking coal and is unsuitable for transportation. This was confirmed by our observations at the steel works in the Saar valley, where there are many coke oven installations, following the same practice, although coke was being made in one works (Neunkirchen) from Saar coal alone."

The possibility of a reciprocal trade arrangement between France and Great Britain, whereby the former would obtain coal in exchange for basic pig iron, is hinted at.

"The French dread the present position of dependence upon Germany for coke supply as, although the peace treaty may give France control of the Saar valley coal fields for 15 years or perhaps for good, the fact remains that under existing conditions they must have coal or coke from Westphalia for their blast furnaces, the coke from Saar coal alone apparently not being satisfactory, so that, so long as this position continues, their industry will remain, to a great extent, at the mercy of the Germans, which the French naturally are most anxious to avoid," the report states.

"But the ideal of the French iron and steel makers in the Lorraine area at the present time, is that means should be devised whereby a reciprocal business may be done with this country, by their supplying us with basic pig iron while we supply them with furnace coke or coking coal," says the commission. If the anticipated output of oven coke in this country is realized we should have some to spare, but the difficulties of transport, trans-shipment, etc., and the resultant breakage are serious factors to be considered. Possibly solution of the present problem may be found in the erection of coke ovens in Lorraine close to the furnaces, and the production of coke on the spot from a mixture of Saar coal and Durham coking coal. The supply of the latter cannot take place until better and cheaper means of transport are available.

"Speaking of the potentiality in the French steel districts, either as competitors with markets for British industries, the opinion is voiced that the 'acquisition by France of these areas and their corresponding loss to Germany should be an advantage to British enterprise.'"

It is probable that France may become a competitor with Britain, in so far as her surplus steel production is concerned, taking the place of Germany to some extent, but not until the destroyed works have been reconstructed and full production reached in three to five years hence.

Due to the result of the war France has replaced Germany as the possessor of the largest iron ore supplies in Europe, France's reserves having been increased by over 2,000,000,000 tons, making them now about four times those of Germany. Before the war they were approximately the same. The production of ore in German Lorraine in the year 1913 was about 21,000,000 tons, and in French Lorraine for the same year the production was 19,800,000. France's present output, therefore, should be nearly double that of her prewar output. Germany's total output of iron ore for 1913 was 28,600,000, of which 21,000,000 tons came from Lorraine, as stated above.

With France's new possession of Lorraine and the Saar valley she is in a position to produce 11,000,000 tons of pig iron annually. In 1913 France's production of pig iron was about 5,000,000 tons. Prior to the war German steelmakers frequently complained of the difficulty of obtaining adequate supplies of foreign ores, which was one of the chief causes of the war, as they hoped thereby to obtain possession of France's ore reserves.

Without the acquisition of the Lorraine iron ore deposits in 1871 it would have been quite impossible for the German iron and steel industry to have developed as it did.

In Lorraine comparatively few developments of the works took place during the war. New construction of this character is given in detail by the report.

At Hagondangue a new six-stand Morgan continuous train was nearing completion on the date of the commission's visit, together with a new five-stand mill.

At Moyeuvres there were no developments during the war, but while the Germans ran the works, billets and blooms were produced and were sent to the Jamaielle and Hayange works of Messrs. De Wendel for reduction into machine wire and small rounds.

At Uckange a new aerial ropeway 17 kilometers long, to bring iron ore from the mines to the furnace, was erected during the war by the Germans, who had contemplated erecting a steel works in conjunction with the existing blast furnaces. A new engine house was erected and a steam turbine stolen from Belgium was installed. This plant has been dismantled by the French authorities and the equipment returned to its owners in Belgium.

At Knutange (Nilvange, formerly Knutingen) there were no developments during the war but considerable tonnages of shell steel and finished shells were produced.

At Maizieres (formerly Moselhutte, belonging to the Rombas group) a new blast furnace was erected for the purpose of supplying hot metal to the new steel works under erection.

At Carlshutte much progress was made during the war for the erection of a large steel works in connection with the existing blast furnaces. The new power house and engine foundations were completed, along with the necessary foundations, pipe and wire culverts, etc. Likewise, 13,000 tons of structural steel mixer, converters, blowing engines, mill stands and rolls, rolling mill engines, etc., which had been stolen by the Germans from works in France and Belgium, were on the site.

At Hayange no extensions were made. The works were run by the Germans and large tonnages of structural steel, cross ties, sheets and

Works Escape Bombs

BOMBING by allied airmen of German steel works in Lorraine and in the Saar and of those plants in French territory occupied by Germany, was ineffective according to the report.

"The damage suffered by the various steel works during the war from bombing was comparatively insignificant," it is stated. "In Lorraine, the works at Hagondange received 400 bombs and 150 bombs were dropped on De Wendel's works at Hayange but the total damage was estimated at not more than £5000. The loss of life was comparatively slight. The German manager at the latter works was evidently very frightened, having constructed a bomb-proof portable cupboard for himself. The same conditions obtained in Saar valley works. In one of these, it was noted that great precautions had been taken to prevent damage to the generators by providing very thick ferroconcrete protections.".....

plates were produced, together with low-carbon sheets for steel cartridge strip.

At Rombas, extensive enlargements were made and have continued under way, although the total output was much less than in normal prewar years, owing to the irregular operations. A new blast furnace at the time of the visit was practically complete. In the large extensions to the steel works then under construction it was intended to install one 500-ton mixer, one 1200 mixer, six 30-ton converters, four 60-ton tilting open-hearth furnaces and a complete equipment of mills.

At Volklingen, Saar valley, a large construction program was carried on during the war, although the works were remodeled in 1900 and well equipped. Waste heat boilers, to use exhaust gases, were undergoing installation late in April and a 15-ton Rochling Rodenhauser electric furnace was being built for the production of steel castings and special steel. Three small open-hearth basic furnaces were erected during the war to produce high explosive shell steel. A steel foundry was built. The works belong to Rochling Bros., who were building the large new steel works in connection with their blast furnaces at Carlshutte.

At Dillingen, in the Saar, nothing of importance was built during the war.

Mark Helps Germany

IF it were not for the depreciation of the mark giving Germany the advantage in foreign trading, England would not have much to fear from the competition of that country, the commission concludes after its study of conditions in the Cologne steel district.

"Germany is suffering more than England from labor unrest, high wages, and shortage of food and material," says the report. 'Trade unionism has taken a strong hold; labor has asserted itself and the indications are it intends to hold the advantages gained. For this reason, the commission formed the opinion that but for the advantage to German exporters of the low exchange value of the mark, England would have less to fear in the immediate future from competition with Germany than it has had in the past. In the larger industrial towns of the occupied territory, there is evidence of malnutrition, especially in the workmen and their families."

At Burbach, in the Saar, one of the blast furnaces worked on German spathic iron ore, a low grade manganese ore from Bingen for the production of ferromanganese. This works appears to have been the only one which succeeded in making satisfactory steel rounds for high explosive shells from bessemer basic steel without a very heavy percentage of rejections. The output was said to have been 2000 tons of 85 millimeter diameter rounds per month. Nearly all the high explosive shell steel was made in the open-hearth furnaces and the basic converter steel mainly was used for structural steel, light rails, wire rods, reinforcement bars, etc.

At Neunkirchen, in the Saar, a new benzol plant was built in connection with existing coke ovens, with a capacity of 200 tons per month. A new blast furnace was nearly completed and a new 900-ton mixer was being installed in the bessemer plant. A 12-ton electric furnace using molten converter steel was installed during the war to produce high explosive shell steel. An extension to the open-hearth department containing three 35-ton furnaces of special design was nearing completion. These furnaces are to be worked from mine Poetter producers.

The works at Joeuf and at Homecourt (both in France just over the Lorraine border) have been badly damaged and are not in working condition—Homecourt, indeed, has been completely destroyed, with the exception of the blast furnaces and some of the power gas engines.

Germany's Operating Difficulties Told

SOME of the operating difficulties which Germany encountered in keeping up production in the Lorraine plants are told by the report. The works suffered severly from the shortage of fuel especially during the later period of hostility. "Many times the blast furnaces have been damped down and the steel works closed entirely for several weeks on end, due to the inability of the Germans to send the furnace coal and coke required, owing to difficulties of transport caused by military exigencies coupled with the bad condition of the railway system and rolling stock in Germany at this time," declares the commission. "Some of the French-owned works in Lorraine were kept at work by the Germans, others just inside the French border, Joeuf and Homecourt, have been idle since the beginning of the war although the Germans made an effort to restart them. They apparently gave up the attempt, stole from the French works the bulk of the plant, tools, buildings, and stores, and destroyed the remainder. The stolen plant, etc., was installed in German-owned works in Lorraine which were kept going as far as ever possible. The Germans also sent a large portion of the Homecourt works plant to Thyssen's works at Bruckhausen.

"Toward the end of the war the difficulties already named due to fuel shortage were accentuated by the absence of lubricants and there is considerable evidence of machinery having become seriously damaged and finally rendered inoperative in some cases, owing to the latter cause. This condition of affairs obtained not in Lorraine alone but also in the German works situated in the Saar valley."

Germany's ineffectual efforts to overcome the shortage of manganese caused by the blockade shutting off imports of manganese ore, are related. It is stated that during the latter period of the war the shortage in manganese was great and its allocations to the different steel works and for specific purposes was in the hands of a commission especially appointed by Germany.

"As a substitute calcium carbide was tried in conjunction with reduced quantities of manganese and this continued for some time," the report states, "there was a consensus of opinion expressed to the commission that it gave very bad results and that about 30 per cent of the steel so produced was scrap, the tops of the ingots being very unsound and the waste in the metal much higher than usual—especially in shell steel. At only one works, Volklingen, it was stated by the management that calcium carbide had been used at all satisfactory. Powdered anthracite was used for the oxidizing purposes in the same way as calcium carbide but was not a success. Apparently many experiments were tried with other materials as substitutes for manganese, great secrecy being observed in regard thereto. But it would seem clear that no satisfactory substitute was found notwithstanding the confident asertions made in the German press during the war. The allocation of manganese for making steel for rails was 2 kilos of metallic manganese, in the form of spiegel or ferromanganese, per ton of rails. During the war the

World Wants Fabricated Ships

United States in Best Position to Supply Immense Demand Forthcoming from Foreign Countries, According to Shipping Board — Italian Firm Orders Four Duplicates of 5350-Ton Steamers Made for American Government

WASHINGTON, Sept. 16.—Immense demand for steel for fabricated ships for foreign account will be made upon manufacturers in this country, according to shipping board officials. The fabricated ship, an American innovation, adopted as a war measure, has found favor abroad and it is expected that there will be an unlimited field in foreign markets for this type.

In support of this opinion, the shipping board has announced that H. R. Carse, president of the Submarine Boat Corp., Newark Bay, N. J., last Friday laid before Chairman Payne, of the board, a proposal from an Italian shipping company to purchase all fabricated parts, machinery and equipment for a 5350-ton steamship. The Italian corporation added that it is disposed to purchase four vessels of the same type and tonnage as the ships being built by the Submarine Boat Corp. for the shipping board.

The Newark Bay plant is operated for the shipping board and for that reason it was necessary to obtain official sanction for acceptance of this foreign order. This was accorded, and Henry R. Sutphen, vice president of the company, will sail this week to confer with the Italian company. The fabricated parts are to be assembled in Palermo.

The shipping board believes that as there is world shortage of vessels many nations in great need of them will have to place orders in the United States. Italy and Japan are said to be short of iron ore, while production of ore in Spain and Sweden has fallen off. The United States, it is explained, can deliver its steel in every port of the world at a cheaper rate than any competitor. Its chief rival is Great Britain. The latest available quotation for steel ship plates made in British plants for export is £19 5s per ton, equivalent at the present rate of exchange to $79.79, United Kingdom ports. The American price for steel plates is around $53 per ton, United States ports.

Believes Industry Will Grow

The fact that parts can be fabricated in American shipyards, transported abroad and there assembled at a less cost than they can be built by the old method, makes it apparent to the shipping board the new industry is likely to undergo a great expansion with a consequent stimulation of manufacture in many sections of the country.

The Submarine Boat Corp., which only two years ago built its plant on a New Jersey meadow, has delivered 60 vessels to the shipping board since then, and launched a total of 75. This is the company which last April, when estimates for ship construction were at $225 per deadweight ton, made an offer to the shipping board to build 12,000-ton freighters at a flat price of $149 per deadweight ton. Mr. Carse said the price was made possible by economy in production, due to standardization and fabricated parts.

This government shipyard employs about 12,000 men, and among the bridge and structural steel plants and machine shops of the country are upwards of 30,000 men employed in producing material for this yard. This diffusion avoids housing problems and the consequence of local labor unrest.

The localities from which fabricated parts are supplied to the Newark Bay yard are Milwaukee, Mount Vernon, O.; Decatur, Ill.; Chicago, Pittsburgh, Louisville, Buffalo, Boston, Philadelphia and Syracuse, N. Y.

Increasing supply of shipping tonnage through redeliveries by the war department to commercial owners and the shipping board, in the meantime, is proving an aid to the export situation. During August 151,000 deadweight tons of shipping were redelivered by the war department to commercial owners, and 74,000 tons to the shipping board, a total of 225,000 tons. This brings the total redeliveries by the department to 3,282,000 tons.

There are in operation in the army's transatlantic fleet 519,000 deadweight tons of shipping, divided as follows: Troop ships, 505,000; refrigerator, 5000; cargo, 9000. There are 381,000 tons out of operation and awaiting redelivery.

Six Million Tons of Ships Being Built

WASHINGTON, Sept. 16.—The advance of the United States among the nations to the post of leadership in shipbuilding is a fair augury for the permanence of its new merchant marine, built under the stress of war. Figures compiled by the United States shipping board show that in June, 1914, the total gross tonnage under the American flag, including coastwise shipping and the fleets operating on the Great Lakes, was 4,287,000 tons. In June, 1919, the gross tonnage was 11,983,000, or an increase of 278 per cent. The steam tonnage under the American flag on June 30, 1919, was 24.8 per cent of the steam tonnage of the world. In the four years preceding the war the shipyards of the country turned out a total of 107 seagoing vessels, of 1500 tons and over. This represented 805,037 deadweight tons. During 1918 there were launched from the yards under the control of the shipping board, a total of 4,216,656 deadweight tons, approximately five times the tonnage of the four prewar years. These shipyards during 1918 delivered 3,107,093 deadweight tons of completed ships.

From Jan. 1, 1919 to Aug. 29, 1919, approximately 3,983,135 deadweight tons were launched and 3,845,140 deadweight tons delivered, a total for the 20 months since the beginning of 1918, of 8,199,791 tons launched and 6,952,233 tons delivered.

The original construction program called for the building in this country of 17,807,071 deadweight tons, consisting of 2105 steel steamships of 14,351,971 deadweight tons; 1017 wood steamships of 2,978,100 tons; 50 composite ships of 175,000 tons and 43 concrete ships of 302,000 tons, a total of 3215 vessels. Of this program 1292 vessels, totaling 7,125,225 deadweight tons have been delivered. They consist of 899 steel steamships of 5,733,622 tons, 378 wood steamships of 1,339,103 tons and 15 composite ships of 52,500 tons. Recent figures

show that at present there are 408 steamships of 1,920,724 deadweight tons, being fitted out in wet basins.

There are a total of 497 vessels, totaling 3,286,105 tons now on the ways, consisting of 389 steel steamships of 3,015,605 tons, 99 wood ships of 207,000 tons and 9 concrete ships of 63,500 tons. Contracts for the construction of 227 steel steamships of a total deadweight tonnage of 1,476,610 tons have been let, on which work has not yet started.

After the signing of the armistice a great number of contracts were cancelled and suspended, in all totaling 886 vessels of a total deadweight tonnage of 4,515,285 tons. These contracts were for 421 steel steamships of 3,077,935 tons, 404 wood ships of 1,111,850 tons, 32 composite ships of 112,000 tons and 29 concrete vessels of 213,500 tons. Subtracting these figures from the total tonnage to be built at the time the armistice was signed, leaves a total of 6,683,439 deadweight tons yet to be delivered to the shipping board, and on which work is now progressing.

Since the shipping board was organized latest figures show that 1307 ships totaling 7,254,042 deadweight tons have been delivered. These include 15 steel steamships of 85,000 gross tons delivered from Japanese yards.

Tariff Board Reports on By-Products in 1918

Washington, Sept. 16.—The tariff commission has just made public a report of a census of dyes and coal tar chemicals in 1918, supplementing a report of a census in 1917 made at the request of President Wilson. The latest report was submitted to the President on his return from the Paris peace conference.

In 1918, 25,997,580 tons of coke, or 46 per cent of the total production of 56,478,372 tons, were produced in by-product ovens. The year's entire output was 1,738,610 tons less than in 1917, but the by-product coke tonnage was 3,558,300 tons greater.

From the output of by-products in 1918, 44,804,900 gallons of pure benzol were obtained, as compared with 36,804,228 in 1917, and 21,079,500 gallons in 1916. Values in the three years fluctuated, the record output in 1918 having been worth only $12,341,779 as compared with $16,576,865, the value of a smaller production in 1917 and $13,159,374 for an even smaller output in 1916. In the case in toluol, 8,861,948 gallons were obtained in 1918, 7,395,174 in 1917 and 3,939,636 in 1916. Here, however, the 1918 value, $12,709,460, was proportionately in excess of 1917, $10,140,013, which, in turn was less than in 1916 when the value was $11,238,268.

Solvent naphtha was produced in steadily increasing quantities but with fluctuating values, as for instance: 1918, 3,540,162 gallons, $498,621; 1917, 2,115,516 gallons, $351,130; 1916, 1,350,726 gallons, $383,584. Sulphate of ammonia was obtained in greater amounts each succeeding year with the values increasing with volume as follows: 1918, 436,388,134 pounds, $19,637,466; 1917, 352,722,848 pounds, $11,973,468; 1916, 271,832,816 pounds, $8,496,278. The naphthalin production and values were: 1918, 16,087,498 pounds, $655,132; 1917, 17,276,044 pounds, $569,449; 1916, 8,820,405 pounds, $289,688.

Comparisons in quantity and value of phenol are given only for 1917 and 1918. In these years the output and value were respectively: 64,146,499 pounds, $23,715,805, and 106,794,277 pounds, $37,270,284.

New Tube Mill

For Lapweld Pipe Will be Built by Youngstown Sheet & Tube Co.

Plans have been formulated for the erection of an additional mill for the production of lapweld pipe from 4 to 10 inches in diameter, at the plant of the Youngstown Sheet & Tube Co., Youngstown, O. As outlined, the addition, which it is expected will add a capacity of 50,000 tons to the mills, will be ready for operation about April 1, 1920, and will cost about $1,000,000. The new mill will increase the total pipe output of the company to 550,000 tons annually and will bring the total yearly capacity of the plants in the Mahoning valley to approximately 900,000 tons of pipe.

The present equipment of the tube department of the Youngstown Sheet & Tube Co., consists of five mills making buttweld pipe from ⅛ inch to 3 inches, and five mills producing lapweld pipe from 2 to 20 inches in diameter. It will not be necessary for the company to provide additional skelp capacity, as existing mills are in a position to care for the new mill.

Call Boiler Meeting

A special convention of the American Boiler Manufacturers' association will be held at the Hotel Astor, New York City, Sept. 24. William H. Barr, president of the National Foundrymen's association, is scheduled for an address on a timely topic. A discussion on boiler costs is expected to arouse much interest. The program contains other interesting features.

Output Hampered

In Refractories by Car and Labor Conditions—Demand Good

Pittsburgh, Sept. 16.—Good demand is noted for refractories, both for steel plant and blast furnace use and recent prices are being well maintained. Plant operations, however, are not expanding materially. Labor, to begin with is none too plenty, while car shortages still are restrictive influence in several producing districts, while in the west, operations have been affected by the inability of manufacturers to secure full supplies of coal, the direct result of the car scarcity.

Present prices, it is claimed, do not allow a number of makers a living profit, but with the iron and steel industry taking about 90 per cent of the refractories production and with iron and steel prices holding stationary, no attempt at boosting brick prices is apparent. Production of magnesite brick still is behind the demand, for the one domestic producer of the basic material of a quality suitable for refractories is not yet back to a normal rate of shipments. Importations still are too small to be a help to the situation.

Refractories

(Per 1000 f. o. b. works)

FIRE CLAY BRICK
(First Quality)

Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00

FIRE CLAY BRICK
(Second Quality)

Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00

SILICA BRICK

Pennsylvania	$40.50 to 45.00
Chicago	45.50 to 50.50
Birmingham	46.50 to 51.50

MAGNESITE BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 85.00

CHROME BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 90.00

BAUXITE BRICK
(Per Net Ton)

55 per cent	$ 40.00 base
76 per cent	100.00 base

Walter-Wallingford & Co. now are the exclusive agents in the Chicago and Cincinnati districts for the Woodward Iron Co., Woodward, Ala., operating five merchant blast furnaces and producing basic, foundry and forge iron.

Says Pittsburgh Base Blocks West

Western Association of Rolled Steel Consumers Files Supplemental Declaration in Basing Point Case—Cites Instance of Alleged Discrimination and Individual Transactions Where Base Price System Was Not Followed Formerly

WASHINGTON, Sept. 15.—Upon the allegation that fabricators of steel in the Chicago district and westward, are unable to compete at points east of Gary, with similar companies in Pittsburgh and the East, because of the practice of the steel producers in naming prices on a Pittsburgh base, plus the freight, the Western Association of Rolled Steel Consumers have filed with the federal trade commission, a supplemental declaration in its complaint against the Pittsburgh basing system. In the new declaration, specific instances are cited which it is claimed illustrate the discrimination against the western fabricators. It is pointed out that Chicago fabricators and dealers in rolled steel products are put at a disadvantage in the state of Illinois as compared with their competitors at Pittsburgh and the Pittsburgh district, to the extent of 7 cents per 100 pounds in the case of Streator and Peoria, 6 cents at Bloomington, Fulton, Galesburg and Quincy, 5 cents at Springfield, East St. Louis and Centralia and 12 cents at Cairo and Johnston City. Instances then are cited pertaining to certain individual members of Western Association of Rolled Steel Consumers to show how the competitors of these companies are favored at specific points.

"Prior to the formation of the United States Steel Corp. and its absorption of the various competing producers of rolled steel, there was no practice of using Pittsburgh as a basing point on all iron and steel shipments—such as is now in existence, and herein complained of by the applicant association," says the new declaration.

"To whatever extent such Pittsburgh basis, or Pittsburgh as a basing point for iron and steel was followed in the trade, prior to the formation of the United States Steel Corp., it prevailed during the time and grew out of the fact that Pittsburgh was the principal manufacturing point for iron and steel, in and near which, and in that district substantially all the rolled iron and steel was produced which is no longer the case or fact.

"That such Pittsburgh base was not, during that time adhered to, but manufacturers of rolled steel, at divers places, in the Pittsburgh district or tributary thereto, such as Buffalo, Phoenixville, Bethlehem, and Wheeling and along the Ohio river in Ohio and Kentucky and other places never observed the Pittsburgh base, but by the absorption of the freight rate, or otherwise, made the price to their customers so as to put those customers on as good a basis as competitors who were near Pittsburgh or as their own proximity to the consuming trade justified.

"That during such time, manufacturers at Pittsburgh and in the Pittsburgh district, who used the Pittsburgh base, customarily, if such base were named, absorbed the freight to the purchaser's destination, or some portion thereof, as they might determine, in getting the order and fixing the prices.

"That such practice of using the Pittsburgh base, during such time, did not apply to or include rolled steel manufacturers outside of such Pittsburgh district, or not near or tributary thereto. For instance, the rolled steel produced at Birmingham, Ala., was sold f.o.b. Birmingham; the rolled steel produced by the Colorado Fuel & Iron Co. was sold f.o.b. Pueblo, Col., where its plants were; producers of rolled steel in or about Chicago and the Middle West sold to consumers at Chicago and in that district f.o.b. Chicago, or the purchaser's destination.

"Manufacturers of rolled steel in the Pittsburgh district, for instance Jones & Laughlin, who are large producers of structural steel and steel used by fabricators, customarily sold their rolled steel products to customers in or about Chicago, or in that district, f.o.b. Chicago, and themselves absorbed the freight rate from Pittsburgh, or their mills, to Chicago?"

Various Sales Are Cited

In support of the declaration that Pittsburgh base was not employed on all iron and steel products prior to the formation of the United States Steel Corp., various sales to buyers in Chicago territory by different steel companies in 1898 to 1903 are enumerated.

Discussing further the Pittsburgh base, it is declared, "that the adoption and application of such basis could only be successful when put into effect by agreement of the different producers, which would be or result in the lessening of competition among such producers and which is in restraint of trade.

"That such an arrangement and practice by agreement or concert of the producers, and its consequent restraint of trade, could be reasonable and lawful, if at all, only where the competing trade is in a single place or district, and does not include producers widely separated, as are producers at Pittsburgh and in the East, and Chicago and the Middle West, and where the districts of large consumption and demand are also widely separated, and one of such districts is near or tributary to the rolling mills and supply of one set of producers, and another district of consumption and demand is in proximity or tributary to another and different place of production; as is the case with the Pittsburgh district, and the Chicago and Middle West district."

Duluth Files Claim for Recognition as Base

The state of Minnesota by its governor and attorney general and the Joint Committee of Civic Organizations of Duluth have intervened in the Pittsburgh basing point controversy and have presented to the federal trade commission the claim of Duluth for being made a basing point. The committee in its complaint says:

Further claiming the Joint Committee of Civic Organizations of the city of Duluth states, that the United States Steel Corp. has in Duluth a plant for the production of steel, the construction of which is of the very best modern type for economical production and is capable of producing at the lowest possible cost, taking advantage of the latest devices and improvements for that purpose and making use of all by-product processes. This plant is located on Lake Superior in close proximity to the iron ore supply, and yet by reason of artificial, unfair and arbitrary price fixing methods employed by the combination of steel interests named herein, this community is deprived the right of erecting and operating of subsidiary mills for the fabrication and sale of secondary iron and steel products in competition with Pittsburgh, which is highly and wrongfully preferred in price schedules by said combination of steel manufacturers, all of which denies to this community and the state of Minnesota the right to develop the iron industry within its borders and enjoy the fullest economic advantages from its natural resources; denies to the producers on the farms of the state the right to enjoy the broader nearby and logically higher market price for his products which would result from the largely increased population, incident to the full development of the iron industry and large saving of freight charges, middldemen and losses in transit.

Further claiming this committee asserts that there should be a base price established f.o.b. the mills of the United States Steel Corp. in Duluth, and that such base price so to be established at such mills be on a parity with that of Pittsburgh and no less favorably to the consumers in Duluth and Minnesota.

Corporation Says Price Pivots On Pittsburgh

In its answer to the action brought by the Western Association of Rolled Steel Consumers just filed with the fed-

eral trade commission, the United States Steel Corp., the Carnegie Steel Co., the Illinois Steel Co. and the Minnesota Steel Co., set forth the interesting claim "that the determination as to whether Chicago shall be a basing point in fixing the manufacturers' price for iron and steel would necessarily involve the determination of the price at which such manufacturers shall sell their products and that such determination is beyond the powers conferred upon the federal trade commission by law." Furthermore it is stated "to merely order that the Chicago manufacturers shall sell such materials as they manufacture at a Chicago base price without fixing such price would but require a change in the name by which the transaction is described without affecting in any way the substance thereof." Some of the salient points of the answer are summarized as follows:

That the Pittsburgh base price is not the result of any agreement by the producers nor arbitrary, but that the prices so charged are controlled by supply and demand.

That the practice of selling at the Pittsburgh base price plus the freight has not been adhered to at all times under all circumstances, depending upon supply and demand.

That the Pittsburgh base is a settled custom in the trade and that vast investments of capital for manufacturing and fabricating plants have been made in reliance upon it.

That Chicago could not properly be made a basing point and that Pittsburgh will continue to be the basing point and in a sense, will continue to control prices of iron and steel so long as the country is dependent upon it, for a substantial portion of its supply. If the leadership in production shall ever pass to Chicago it will automatically become a basing point.

It is denied that discrimination is made between the purchases of iron and steel in the Pittsburgh and Chicago district. It is stated, however, that sales generally are made to the manufacturers of agricultural implements and that steel rails and accessories are sold to the railroads on a different basis and in certain products at a lower price than to other customers, but that these buyers are not in competition with other classes of users.

Put Automatic Puddler in Operation

THE Lebanon Valley Iron & Steel Co., Lebanon, Pa., appears to have reached a solution to the labor problem at least so far as concerns wrought iron bar manufacture, that likely will serve as a most practical object lesson to the trade both in the East and in the West. On Sept. 11 the company put into initial operation its new and unique wrought iron rolling mill which practically eliminates and actually reduces to a minimum hand work in the manufacture of bar iron. This elimination of hand labor has been attained through the very ingenious application of steel mill equipment and practice to the manufacture of iron bar.

The equipment includes principally eight revolving automatic puddling furnaces, each of which is designed for and those now operating actually do produce five heats per hour. Each heat produces a ball ranging in weight from 600 to 1200 pounds, as desired, the size being gaged accurately. Each of the eight furnaces rotates upon a horizontal axis much after the style of a tumbling barrel. Two of these furnaces were put in operation Sept. 11 and two more had been lighted, while four others have been completed.

Each furnace is fired separately by a stationary fire box built much after the style of the ordinary heating furnace fire box, and the heated gases, etc., pass through a 24-inch bricked arch into the puddling furnace proper. This latter furnace is lined with standard-size magnesite brick, and upon this lining through the charging door is charged the scrap by means of an ingeniously rigged, hand-operated machine after the general style of an open-hearth charging machine. The waste heat and gases pass through another brick arch way into a 250-horsepower vertical water tube boiler which supplies the steam for the roll ing mill engines. One of these boilers is attached to each of the furnaces.

The door of the revolving puddling furnace contains the newest idea in furnace construction. This furnace is the invention of Walter C. Ely, treasurer and general manager of the Highland Iron & Steel Co., Terre Haute, Ind., from which the Lebanon company purchased a license to construct and operate. Mr. Ely has been operating at the Highland plant similar furnaces for something like two years but the fact never was generally known and was kept quiet under the wartime secrecy generally having been observed by the iron and steel trade. This door is of a size designed to allow a 600 to 1200-pound ball of heated iron to drop from the bottom of the furnace onto a link belt below. The door is operated by the same man who controls the rotating of the furnace itself, and is closed and opened by a 15-horsepower motor attached to the moving furnace itself. The charge of metal includes either No. 1 wrought, turnings or light material all of which is stored on the charging platform which is 100 x 43 feet 6 inches on each side of the center of the mill, two furnaces being served from each charging floor. After the ball has been heated sufficiently, the furnace itself having sufficient depth to permit a slag bath of 7 to 9 inches in depth, thus preventing dry heating, it is discharged through the open door by gravity upon a link belt conveyor moving 400 feet per minute and designed to carry balls up to 1200 pounds weight. This conveyor moves the ball to an automatic dump which serves the 72-inch squeezer. After the bloom has emerged from the squeezer another conveyor, moving 150 feet per minute, carries it to the muck rolls for the first pass. The bloom then passes through the various passes of a specially turned 22-inch, 3-high muck mill and is rolled out as muck bar or billets, down to 2 x 2 inches. The revolving furnace is mounted upon carrying rings, 10 feet 5⅛ inches in diameter which revolve on driven pulleys which are 14 x ⅞ inches outside diameter and 5-inch face. A 20-horsepower motor rotates each furnace.

The finished muck bar and billets are carried out on sprocket driven rolls in the floor to the steel-rail built cooling bed. Other conveyors handle the product to the shears at the end of the mill, the product later being handled by electric magnets. In fact, the provision for scrap unloading from cars to the charge platform and the various arrangements around the cooling beds, allow for electric magnet operation with the greatest facility. The interior of the plant is served by three 5-ton electric cranes which also operate magnets.

The main mill building is 380 feet long, being constructed of 19 bays, each 120 feet long and the total width of the main building is 147 feet 8 inches. The building is of steel and brick with steel sash and glass. The roof is of special cement block. Concrete construction underlies every portion of the main mill floor, charging floor, etc. Forced draft to the furnaces is furnished by blowers situated underneath the charging floors. The furnaces are fed at this time with bituminous slack, each furnace by one laborer, while the rest of the automatic operation is directed by a third man who controls both the rotating furnace and the operating door on two furnaces. Thus, each furnace is served by 1½ men.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

WILLIAM BARRY has resigned as superintendent of the plant of the Pittsburgh Iron & Steel Foundries Co. at Midland, Pa., and his place temporarily is being filled by Benjamin F. Parlett Jr., assistant superintendent. Mr. Parlett, who has been the company for the past six years, recently was promoted from the position of production clerk to assistant suprintendent.

A. L. Fay has resigned as manager of the Chicago office of the Werner G. Smith Co., Cleveland.

John P. Fahy has accepted a position as foundry superintendent with the Coe Mfg. Co., Painesville, O.

J. A. Moore has resigned his position as foundry superintendent of the American Blower Co., Detroit, Mich.

I. H. Carbaugh has been appointed general foundry superintendent for the United Roll & Foundry Co., Ravenna, O.

Pierce G. Smith, formerly sales manager of the American Malleables Co., Lancaster, N. Y., and Owosso, Mich., has been elected vice president.

J. Carroll Kennedy recently was made works manager of the Kennedy Valve Mfg. Co., Elmira, N. Y., succeeding the late Daniel J. Kennedy.

O. J. Rice who until recently was in government service on the Panama canal has accepted a position as foundry foreman with the Aurora Foundry Co., Seattle, Wash.

Louis Rasmussen formerly with the Northern Foundry Co., Marinette, Wis., has accepted a position as foundry superintendent for the Nash Motors Co., Racine, Wis.

N. M. Loney has been elected vice president of the Thompson-Starrett Co., 51 Wall street, New York. He resigned recently as chief engineer of the American Can Co.

John O. Tucker has been placed in charge of the Detroit office of the La Belle Iron Works, Steubenville, O. It is located in the Book building and Mr. Tucker is manager of sales.

A. H. Moreland has been elected treasurer of the Slick-Knox Co., Wheatland, Pa. He formerly was treasurer of the Carnegie Steel Co., Youngstown, O.

William G. Hammerstrom, formerly general superintendent of the Lynchburg Foundry Co., Lynchburg, Va., has been named general manager of the Steel Castings Corp., Altavista, Va.

Scott Mackay, recently with the British Forgings, Ltd., Toronto, Ont., and previously with Jones & Laughlin Steel Co., Pittsburgh, has been made general superintendent for the Stowell Co., South Milwaukee, Wis.

Henry M. Robinson, whose resignation as commissioner of the United States shipping board has been accepted by President Wilson, completed his work last Saturday and left for his home in California.

William H. Bruce, sales manager for the Mark Mfg. Co., Chicago, who has been stationed at Minneapolis, has been made southern sales manager for this company and the Steel & Tube Co. of America, with headquarters at New Orleans.

Frank P. Colville has been appointed manager of the Ashland, Ky., office of Eaton, Rhodes & Co., Cincinnati, pig iron, coal and coke merchants, with whose sales force he has been connected for some time.

Urban W. Frink, for the past three years manager of Boston office of the E. J. Woodison Co., Detroit, has left the employ of the company to open an office for the sale of foundry supplies and equipment in Boston.

L. E. Paynter, formerly foundry superintendent for the Sowers Mfg. Co., Buffalo, has accepted a similar position with the Connersville Foundry Corp., successors to the Hoosier Castings Co.

Erwin L. Malone has been appointed Cleveland district representative for the Hess Steel Corp., Baltimore. His headquarters at present are in care of the Cleveland Athletic club, Cleveland.

Ernest A. Foster, who for the past nine years has been manager of the Birmingham, Ala., plant of the American Radiator Co., has been transferred to the Detroit works, where he will occupy a similar position.

Graham Macfarlane Jr., late lieutenant of engineers, American expeditionary forces, has been appointed assistant to the president of the Red River Iron Works, Clarksville, Tenn., and the Dover Iron Co., Carlisle, Tenn.

S. E. Weaver now is identified with the sales force of the Davidson Tool Mfg. Corp., New York, as manager of the eastern Pennsylvania and southern territory. For several years he represented the Union Twist Drill Co., in a similar capacity.

Austin T. Hunt has been appointed manager of sales of the Seneca Iron & Steel Co., Buffalo, succeeding S. B. E. McVay, resigned. Mr. Hunt has been connected with the sales department of the company for the past 10 years.

R. W. McPhee and John Fechnay have become affiliated with the sales department of Barbour, Love & Woodwood, Singer building, New York City, machine tool dealers. They formerly were associated with L. Stewart Love, who is a partner in the new enterprise.

William Burleigh has become chief engineer of the Machinery Sales & Electric Co., Detroit, in charge of designing, estimating and engineering of elevating and conveying equipment. For the past three years he has been assistant superintendent of the Packard Motor Car Co., Detroit.

W. H. Baltzell, chief engineer of the Canadian Steel Corp., Ojibway, Ont., paid a short visit to Pittsburgh recently. Mr. Baltzell formerly was chief engineer of the American Steel & Wire Co., and before making his present connection was chief engineer of the Pittsburgh Crucible Steel Co., Midland, Pa.

Sam A. Schaeffer, who several years ago left the Clarage Fan Co., Kalamazoo, Mich., where he was foundry superintendent to accept a similar position with the Sheffield Car Co., now the Fairbanks-Morse Mfg. Co., Three Rivers, Mich., has returned to the Clarage Fan Co. as assistant to the general superintendent. B. C. Page, formerly with the Northwestern Harvester Co., Spokane, Wash., succeeds Mr. Schaeffer with the Fair-Banks-Morse Mfg. Co.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

GEORGE E. RANDLES, who has become president of the reorganized Foote-Burt Co., Cleveland, manufacturer of single and multiple spindle drilling machines, has been vice president for some time. He has been acting head of the company for the past 10 years, having become affiliated with it when it became incorporated in 1906. Former President and Treasurer A. W. Foote and Secretary S. G. Burt have retired. T. H. Doan Jr. succeeds Mr. Randles as vice president. W. S. Quinlan is secretary and S. E. Gross, treasurer. During the war, Mr. Randles served in Washington as director of maintenance of the motor transport division of the entire United States army at home and overseas.

George R. Sumard resigned recently as sales manager of the Ferro Stamping Co., to become affiliated with the Cadillac Tool Co., Detroit.

Glenn C. Crips has been appointed general office manager of the Republic Motor Truck Co., Alma, Mich., to succeed E. A. Godley, resigned.

Albert V. Pickering, a Worcester, Mass, mechanical engineer, has been elected president of the Victor Service Sales Co., recently organized in that city.

Spencer A. Reed has resigned as cashier of the Orange National bank, Orange, Mass., to be treasurer and office manager of the Athol Mfg. Co., Athol, Mass.

Charles B. McBride, Brooklyn, N. Y., is a director of the recently incorporated Milner-Flower Electric Co., Inc., Buffalo, formed to deal in electric machinery, etc.

Carroll Miller, for several years general manager of the Philadelphia Co., has been made vice president of the Guffey-Gillespie Oil Co., Union Bank building, Pittsburgh.

J. G. Brezinski recently was appointed general foundry superintendent for the Star Mfg. Co., New Lexington, O., manufacturer of mine and contractors' cars, semisteel car wheels, mine equipment and forges. Mr. Brezinski formerly was with the Kanawha Mfg. Co., Charleston, W. Va.

Charles M. Booth, sales manager of the Worcester, Mass., district of the American Steel & Wire Co., is confined to his home in that city suffering from a nervous breakdown.

John W. Odlin, advertising manager of the Clinton-Wright Wire Co., Worcester, Mass., has been elected first vice president of the Advertising Club of Worcester.

John T. Chidsey, president and treasurer of the C. J. Root Co., Bristol, Conn., has been nominated for president of the Bristol chamber of commerce for election at the annual meeting, Oct. 14.

J. D. Weekes has been appointed district representative with offices at 704 Keith building, Syracuse, N. Y., for the Heppenstall Forge & Knife Co., Pittsburgh, and the Heppenstall Forge Co., Bridgeport, Conn.

Kenneth Joslin has become factory manager for the Goddard Tool Co., Chicago. He resigned as chief inspector for the Goddard company some time ago to assume similar duties with the Universal Engineering Co., Maywood, Chicago.

Leroy S. Starrett, president of the L. S. Starrett Co., and president and treasurer of the Athol Machine Co., both of Athol, Mass., has transferred as a gift land to the town as a site for a $200,000 town hall as a memorial to soldiers and sailors.

John Kopf has been appointed manager of the engineering department conducted by the Duff Mfg. Co., Pittsburgh, lifting jacks, etc. Before becoming affiliated with the Duff company, Mr. Kopf was with the bureau of aircraft production, Dayton, O.

Capt. Robert E. Nugent, who was manager of the housing development for the Groton Iron Works, Groton, Conn., during the war, has joined the sales force of the Norton Co., Worcester, Mass. Before entering the service Captain Nugent was with the Barrett Co. for nine years.

John W. O'Leary, of the Arthur J. O'Leary & Son Co., Chicago, has been elected a vice president of the Chicago Trust Co. Mr. O'Leary is president of the National Metal Trades association and a director in several industrial corporations.

George S. Barton, president and treasurer of the Rice, Barton & Fales Machine & Iron Co., Worcester, Mass., is chairman of the Worcester committee in charge of the campaign to raise an endowment fund for Harvard university of $11,000,000 next month.

George W. Short who on Aug. 30 severed his connection with the Sharon Steel Hoop Co., recently was tendered a farewell reception by the officials of that company at the Poland country club, Youngstown, O., on which occasion he was presented with a gold watch.

George H. Ashley, of the United States geological survey, an expert on coal lands of the eastern part of the United States, is to be the new state geologist of Pennsylvania and will be named to be chief of the new bureau of geological and topographical survey of the department of internal affairs. The formal announcement will not be made for some days. Mr. Ashley, who has spent much time studying Pennsylvania, has been engaged in government work in various coal-producing states.

C. N. Replogle, formerly general manager of the Ralston Steel Car Co., Columbus, O., has been made general manager of the new plant being erected at Cleveland and Fifth avenues, that city, by the Timken Roller Bearing Co., Canton, O. Two years ago, Mr. Replogle became general manager of the Symington Forge Co., Rochester, N. Y., which manufactured shells for the government. Later he went to the Symington-Chicago Corp., Chicago, as general manager.

W. A. Downing has been made sales manager for the Cutter & Wood Supply Co., Boston. For over three years he has been affiliated with the George F. Foss Machinery & Supply Co., Montreal, Que., in the joint capacity of manager of the small tool department and of general advertising. Prior to his connection with the Foss organization, he specialized in small tool equipment, serving many American manufacturers in various capacities. As manager of the small tool department of the George F. Foss Machinery & Supply Co., he is succeeded by A. G. Clark, who for five years has been that company's accountant.

Ready to Build Mills at Duluth

Steel Corporation Has Plans Prepared for Sheet and Wire Plants—Nail and Tin Plate Mills to be Constructed Later — Additional Blast Furnaces and Coke Ovens Also Considered—Tonnage Tax Bill Up Again

(*Special Correspondence*)

DULUTH, Minn., Sept. 12.—Charles P. Craig, chairman of the Duluth steel base committee, has received a letter from E. H. Gary, chairman of the United States Steel Corp., relating to the corporation's plans for building sheet, wire, nail and tin plate mills at Duluth.

"We have this very day been considering plans for the improvements at Duluth," Judge Gary wrote. "We shall proceed as rapidly as circumstances permit."

From another source it was learned that tentative plans have been drawn for the sheet mill and the wire and wire fence mill. Duluth business men frequently made inquiries regarding the plans of the corporation, announced last October.

The sheet mill will have a monthly capacity of 20,000 tons, while the wire and fence mill will have a capacity of 10,000 tons.

The combined capacities of the two mills, and that of the merchant mill at the Minnesota Steel Co.'s plant, it is estimated, will more than take care of the local works' monthly capacity of nearly 60,000 tons of semi-finished steel.

A site for the sheet mill has been surveyed on the tract of land between the steel plant and the Universal Portland Cement Co.'s plant. The wire mill will be built along the river near the present machine shop.

Persons in close touch with the situation assert that the construction and operation of the two mills will create new demands for steel that may be met by the construction of units already planned as additions to the Minnesota Steel Co.'s present plant. These include additional blast furnaces, another battery of coke ovens, 14 open-hearth furnaces, and an enlargement of the open-pit furnace building. In commenting upon the situation, Mr. Craig said:

"Duluth's prospects today as regards developments in the steel industry are better than ever. Unless we had steel plants here, the elimination of the Pittsburgh plus base method of basing steel prices would mean little to us. Much good would result to this city, however, if the local steel plant was in a position to utilize the ore at its doorstep, and turn it into finished products for distribution from this territory. That we shall have both of the steel plants and the benefit of the removal of the Pittsburgh-plus millstone, now seems to be the promise of the near future."

Tonnage Tax Bill Up Again

The tonnage tax bill has bobbed up again at the special session of the Minnesota state legislature. The bill introduced by Representative Bendizen provides for a 5 per cent tax, but efforts are being made by the nonpartisan party interests to raise it to a tax of 10 per cent on the net value of the ore. The idea of the promoters of the bill is to put the members on record without referring the bill to a committee. The plan is believed doomed to failure, as the legislative session has been limited to ten days, and also to the discussion of special business.

Shipments of ore from the docks have been curtailed by the strike of the coal dock workers. While the Oliver Mining Co., has been drawing coal supplies for its mines from the Misabi coal docks at Duluth, the independents have not been so fortunate in obtaining fuel to keep them going. Nearly all the operators have been on short allowances of coal for some time. Some coal was imported from western Canada, and other lots were brought in from various points. The difficulties of the iron ore mine operators as regards coal are thought to be about over, however, as the backbone of the dock strike has been broken.

Reports from the ranges are to the effect that mine operators are speeding up as much as possible, and it is hoped that a fair showing will be made in ore shipments from the docks during the present month. With a shortage of over 9,000,000 tons reported in shipments from the Lake Superior district up to Sept. 1, it is now thought extremely doubtful if the total for the season will exceed 47,000,000 tons. "Shipments during the remainder of the season will depend largely upon weather conditions," said an operator. "The mines are in position to ship the ore down, provided vessels are available to keep the docks clear. Nearly all the furnace interests in the East will be fairly well supplied with ore, considering the fact they had large stocks on hand when the season opened."

The Oliver Iron Mining Co.'s last payroll in the Hibbing, Minn., district is said to have been the largest at that point in the company's history. That company has been pushing its mining operations in spite of unsettled labor conditions, and heavy disbursements are being made in connection with building operations at its new townsite in the central addition of Hibbing.

Mining operations on the Cuyuna range are below normal at present with all the manganiferous ore properties idle on account of the large supplies carried over from last season by consumers.

The properties now operating on that range include the Sagamore and Croft mines, being developed by John A. Savage & Co., and the Armour No. 2 and the Cuyuna-Duluth mine, owned by the American Manganese Manufacturing Co. The last named mine expects to ship out 100,000 tons this season.

Six Stacks

Eventually Planned for St. Louis Plant—First Unit is Contracted for

Chicago, Sept. 11.—Construction of a 500-ton blast furnace plant and a battery of 80 Roberts by-product coke ovens at Granite City, Ill., by the St. Louis Coke & Chemical Co., is the beginning of what is laid out eventually to contain six blast furnaces and 320 Roberts ovens.

The pig iron from this blast furnace has been contracted to the National Enameling & Stamping Co., of Granite City, which owns a large interest in the St. Louis Coke & Chemical Co. It is expected this stack will be completed and in blast at least by June 1, 1920. As plans now are outlined, a second stack will be started before the first one is completed and construction of the remaining stacks will follow as circumstances warrant. Building of additional coke oven units will keep pace with the blast furnace growth.

The Roberts type of by-product ovens will use 100 per cent Illinois coal for the production of the coke. This it is declared has been demonstrated to be a successful process by

the coking of some 9000 tons of Illinois coal in a Roberts plant owned by the M. A. Hanna Co., at Canal Dover, O. The coke so produced was used and tested in blast furnace practice.

The ore for this blast furnace plant will be brought from the Mesabi ranges by boat to Chicago and thence by rail to Granite City. Arrangements are being made for construction of an unloading plant on the south branch of Chicago river, where the ore will be transferred from boat to storage or to cars ready for shipment. Some move has been made toward handling the ore by rail to Minneapolis and then by barge on the Mississippi river to Granite City but this probably will not be developed until later.

It is not presumed that the National Enameling & Stamping Co. will be able to take the entire output of the plant as it grows larger, but the consuming capacity of other plants in the East St. Louis district is believed to be sufficient to absorb the entire tonnage, especially now that southern iron is practically excluded from the northern market.

Considerable economy in operation is expected to result from the use of Illinois coal in coke making, as the freight on this fuel from the Illinois field is only a small fraction of the freight on eastern coal, which is almost universally used for the production of by-product coke.

The St. Louis Coke & Chemical Co. is a subsidiary of the American Coke & Chemical Co., 208 South La Salle street, Chicago, which controls the Roberts type of by-product ovens. Freyn, Brassert & Co., engineers, 122 South Michigan avenue, Chicago, are in charge of design and construction of the blast furnace plant, while engineers of the American Coke & Chemical Co. are constructing the coke ovens.

It is expected to have the plant in operation on June 1, 1920.

Interested in the development of the project are the American Coke & Chemical Co., the National Enameling & Stamping Co. and the St. Louis Coke & Chemical Co. The directors are: Scott Brown, Chicago, managing director Studebaker Bros. Trust; George T. Buckingham, Chicago, Defrees, Buckingham & Eaton, attorneys; L. E. Fischer, St. Louis, general manager St. Louis Coke & Chemical Co.; George B. Hagerty, New York, treasurer National Enameling & Stamping Co.; John Henry Hammond, New York, Brown Bros. & Co.; Breckinridge Jones, St. Louis, president Mississippi Valley Trust Co.; George W. Neidringhaus, president National Enameling; Fred C. Orthwein, St. Louis, capitalist; F. B. Richards, Cleveland, M. A. Hanna & Co.; Clement Studebaker, Chicago, president Studebaker Bros. Trust, and George M. Studebaker, Chicago, vice president, Studebaker Bros. Trust.

The officers are: Clement Studebaker, president; Arthur Roberts, chairman of executive committee; George W. Niedringhaus, vice president; George T. Buckingham, vice president and general counsel; Scott Brown, secretary and treasurer; W. G. Maguire, assistant secretary in charge of sales; L. E. Fischer, general manager; M. W. Ditto, consulting engineer; C. S. Lomax, chief engineer in charge of operations; P. E. Irvine, general superintendent, and A. C. Parclay, comptroller.

British Steel Report

(*Concluded from Page 777*)

blast furnaces especially in Lorraine were compelled to use spiegel slag to provide the manganese required, owing to their inability to obtain manganese ore from India, Caucasus or Brazil. The manganese content in this slag is about 10 per cent or less and reduces the output of the furnaces. This condition of affairs remained at the time of our visit. No doubt the shortage was felt equally as severely at the blast furnaces as at the steel converters and furnaces. In some of the Saar valley works it was found that low grade native manganese ore had been and was being used. It was stated that during the war the Germans used liquid air in some of the iron ore mines in Lorraine in place of explosives for blasting purposes."

Picture of Belgian Industry is Gloomy

THE Cologne section of the commission reporting its observations drew a gloomy picture of the outlook of the future of the Belgian plants which it had visited. If contrasted, the shattered condition of these works with the well-ordered state of the German plants in the occupied territory.

"The German works in the occupied territory and those with German interests in Luxemburg and Belgium are all in good order and ready to start at full blast as soon as the restrictions on the supply of raw material are removed," the report says.

"The responsible officials of all the Belgian works visited took a gloomy view of the future. Nearly all had made inquiries in England and elsewhere, for plant and machinery to restore their works, but found the prices quoted for machinery and structural steel for reconstruction purposes so high as to make them hesitate in starting work.

"The commission obtained the impression that the Belgian manufacturers believe that the world has not realized the disastrous extent to which the basic industries of iron and steel have been injured in Belgium. Of 60 blast furnaces, existing in Belgium before the war, not one is today in blast; and it is anticipated that not more than 40 per cent of these can be got to work within the next 12 to 18 months.

"The unemployment in the industrial areas is appalling. The commission was informed by the Baron Forgeur, of the ministry of economics in Brussels, that out of 1,200,000 workmen, 800,000 are still unemployed, and that these and their families to the number of at least 2,000,000 are receiving doles.

"The Sambre-et-Moselle works at Charleroi, which is the most completely equipped and the best furnished plant in Belgium, was left practically intact by the Germans and ready to start work almost at once, the only material removed being the copper fittings and cables and the bench floor plates of the coke ovens. On making inquiries, the commission learned that the reason for sparing these works was the large interest held by the German capitalist, Thyssen.

"The works in the Chareroi district owned by the Belgians were completely destroyed and will require several years to reconstruct.

"It may be assumed that the destroyed works of Belgium and France will be restored on the most modern lines and that they will thus eventually (say in five to 10 years) be excellently equipped for efficient production. In addition, Germany may by that time have resumed a stable position in the trades in which case the total competition from those countries may be more severe than it has been in the past. But, as regards the immediate future the commission is of the opinion that a big and valuable market during the next two or three years would be secured for British iron and steel, machinery and plant in Belgium and France if suitable financial arrangements could be made."

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

WITH a capital stock of $100,000, the Goldberg Iron & Steel Co., Columbus, O., has been formed by I. L. Goldberg, who recently purchased the Topper Bros. Iron Co., in that city, conducted by Isaac Topper. The purchase includes the business and equipment and also covers the lease to two acres of railroad property used as yards. Harry Goldberg is president of the new company; Joe Topper, vice president; I. L. Goldberg, treasurer and Arthur Goldberg, secretary. These and A. Goldberg constitute the directorate. The plant is to be rebuilt and a locomotive crane as well as additional shears installed.

* * *

T. L. DODD & CO., Railway Exchange building, Chicago, have been appointed western sales representatives of the Worth Steel Co., Claymont, Del.

* * *

MORE than $500,000 worth of machinery has been added to the steel plant at Wheatland, Pa., since it was acquired by the Slick-Knox Co. The plant is expected to begin operations before Oct. 1 and will specialize in motor truck frames. The output is expected to reach 900 daily with present equipment.

* * *

FOR the purpose of making fine steel for high-grade wire rope, the Black Steel & Wire Co., Kansas City, Mo., has purchased an electric furnace from the Pittsburgh Electric Furnace Corp., Pittsburgh, for its new steel plant. W. E. Moore & Co., Union Bank building, Pittsburgh, are the engineers.

* * *

BEFORE Oct. 1, the Maibohm Motors Co., Sandusky, O., expects to occupy its new plant. This 118 x 620-foot building is one story high, of saw tooth, fireproof, daylight construction, with concrete foundations and walls are of steel sash set in brick. The 18 x 522-foot loading platform is served by side lines from the New York Central and Big Four railroads. The site on which the building is being constructed by the Northwestern Bridge & Iron Co., Milwaukee, general contractor, comprises 18 acres. The plant will have a daily capacity of 50 cars. It includes a complete body building plant, with wood and sheet metal working machinery, painting, trimming and top-building equipment. Power-driven conveyor equipment for chassis assembling also is included. All equipment has been purchased. The production schedule for 1920 will be 7500 cars.

* * *

A BUSINESS connection has been made with the J. R. Stone Tool & Supply Co., 997 Woodward avenue, Detroit, by the Victor Tool Co., Waynesboro, Pa., and the former company now is its exclusive agent in Michigan. It will handle the Victor Tool Co.'s entire line of self-opening die heads, collapsible and adjustable taps, reamer holders, nut facing machines. Stocks of these tools will be carried in its Detroit quarters.

* * *

THE Journal of Better Bearings is the name of the house organ of the Damascus Bronze Co., Pittsburgh, the first number of which made its appearance in August. The front cover, which is in three colors, contains a bird's eye view of the company's plant and carries the line, "Bearing Tidings from Damascus", illustrated by a figure mounted on a camel moving across the desert from a Moslem temple to a steel plant. The publication contains much of interest not only to those connected with the organization but also to users of bearings.

* * *

THE Dearborn Iron & Power Co., capitalized at $500,000, with offices at Dearborn, Mo., and Kansas City, Kans., has been incorporated to take over the plant and assets of the Kansas City Malleable Foundry, the Kansas City Pattern Works, National Machine & Construction Co. and the Star Brass Works. The new company has assembled them under one head at its plant at First and Washington streets and will manufacture malleable, semi-steel, gray iron, brass and aluminum castings, as well as operate pattern and machine shops. Complete modern equipment has been purchased and the company will soon have in operation a large foundry at Dearborn, specializing in light soft gray iron castings for machine work.

* * *

THE plant of the Shenango Iron & Steel Co. at Wheatland, Pa., which was purchased a number of years ago by Max Soloman of Beaver Falls, Pa., and which has been idle for the last 11 years, has been sold to the New Process Iron & Steel Co. of Noblestown, Ind. The plant is to be dismantled and the machinery, equipment and buildings removed. Mr. Solomon retains the water line, car plant and sidings on the Pennsylvania and Erie railroads. When last in operation the plant employed 500 men and produced sheets and puddled iron.

* * *

THE Harry M. Hope Engineering Co., Unity building, 165 Devonshire street, Boston, is purchasing equipment for the new factory of the Seamless Rubber Co., Inc., New Haven, Conn. It is in the market for hard rubber dust grinding and sifting equipment; steam-jacketed and hydraulic press vulcanizers; tubing and washing machines; buffing and grinding wheels; steam as well as steel and wood factory tables; steel storage racks, bins, shelves, etc.; heavy metal pans and trays; steam-jacketed and plain cooking kettles; wet and dry tumbling barrels; soft metal melting furnace; factory trucks and dummy elevators, etc.

* * *

THE Willys Corp., New York, has purchased two plants of the Duesenberg Motors Corp., one at Elizabeth, N. J., and the other at Poughkeepsie. It is said some new financing will be undertaken in connection with the transaction. When it was announced that the Willys Corp. had been formed to manufacture a new 6-cylinder car it was stated that this was necessary as the Willys-Overland Co. could not undertake the manufacture because its own plants were being pressed to capacity. The Poughkeepsie factory formerly was the Fiat plant. It is intended to enlarge both plants.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

A REORGANIZATION of the Foote-Burt Co., Cleveland, manufacturer of single and multiple spindle drilling machines, has been effected. The company was incorporated in 1906, prior to which time the business was conducted as a partnership for 14 years by A. W. Foote and P. H. Burt. The Burt estate, representing the preferred stock interest, has been retired. Mr. Foote and S. G. Burt retire as president and treasurer and secretary respectively. G. E. Randles, formerly vice president, becomes president; T. H. Doan Jr., vice president; W. S. Quinlan, secretary, and S. E. Gross, treasurer. The board of directors consists of Messrs. Randles, Doan and Quinlan with J. R. Blakeslee and S. L. McCune. The erection of a modern plant at St. Clair avenue and the Belt Line railway is contemplated by the new company, in order to care for the increasing demand for its product as well as complete equipments for quantity production from the automobile field. Refinancing and reorganization has been through the medium of the Foote-Burt Machine Co. and Cleveland Investment interests.

* * *

THE Southern Wheel Co., Birmingham, Ala., announces it has just placed orders for new foundry and machine shop equipment to greatly increase its output of hollow-axle mine car trucks.

* * *

C. D. NEWTON, SALES ENGINEER, INC., is the name of a new corporation formed in Wisconsin with headquarters at Milwaukee by Clarence D. Newton, James B. Welch and M. A. Hintz. The new corporation will engage in the manufacture and sale of mechanical appliances. It has a capital stock of $15,000.

* * *

F. L. McDERMOTT, for many years foreman for the New England Iron Works, New Haven, Conn., has purchased the property and business of John Spargo in that city and will incorporate it under the name of the McDermott Iron Works. He also has leased adjoining property for yard room. With Mr. McDermott will be associated his brother, James M. McDermott. The corporation will do a general contracting business in structural and ornamental iron, giving special attention to forge work, and expects to commence operations early this month.

* * *

ADDITIONAL machinery is being installed by the American Cement Machine Co., Inc., Keokuk, Ia., in its plant which is being enlarged. It desires copies in duplicate of catalogs with price lists from manufacturers and jobbers of iron, steel and mill supplies.

* * *

IN addition to its regular line of hard bars, the Witherow Steel Co., Pittsburgh, now is producing medium carbon rods for forging and machining purposes. This company recently purchased about 30,000 tons of shell steel, practically all 3¼-inch rounds, from the French government and it is from this material that the company will roll these medium carbon rods.

* * *

THE Standard Screw Products Co., Detroit, has purchased all the real estate holdings of the McDonald Coal & Brick Co., adjoining its present plant on the west side of Bellevue avenue and the Belt line railroad and also all of the frontage of this plant on the east side of Bellevue avenue. Contracts have already been let for a 2-story manufacturing building to be used further to expand the Standard Screw Products Co.'s business.

* * *

SUTTON, STEELE & STEELE have incorporated with a capital of $1,000,000 in order to extend the enterprise, their immediate plans provided for doubling the present works at Dallas, Tex., at a cost of $200,000. Buildings will be erected and machinery installed for an iron foundry and a testing laboratory on a 3-acre site. The product of the works is a machine to separate ores or other materials of differing specific gravity.

* * *

THE United Hammer Co., Oliver building, Boston, now is prepared to furnish power hammers in sizes up to and including those 500-pound rams, that size with the 400-pound size recently having been added to the line. Heretofore they have only been built with rams weighing up to 300 pounds. These heavier hammers have been brought out to supply the demand from locomotive and car shops, shipbuilding plants and tube and steel mills as well as oil well tool work.

* * *

THE Bridgeport Castings Co., now in process of incorporation with capital of $100,000, will engage in the manufacture of brass, bronze and aluminum castings. It will utilize the plant formerly occupied by the Bridgeport Tube works, recently sold at public sale. The new company expects to begin manufacturing about Sept. 10. The incorporators are: Harry B. Houghton, Edward P. Quinn, Torrington, Conn.; Thomas R. Good and William H. Monagan, Waterbury, Conn. The Bridgeport Brass Co. also recently announced the building of a new foundry, at about $100,000.

* * *

THE Electrolytic Oxy-Hydrogen Laboratories, Inc., New York, as announced in the Aug. 28 issue of THE IRON TRADE REVIEW, page 600, has formed a sales and manufacturing company under the name of the Electrolabs Co. This provides an organization to meet the increasing demands of the business. The Electrolytic Oxy-Hydrogen Laboratories, Inc., will continue in charge of the laboratories and maintain a technical supervision over the work of the new company. The general offices and works of both companies have been moved from Dayton, O., into larger quarters at 2635 Penn avenue, Pittsburgh. The facilities for production of the new plant will be many times greater than the old plant, and will make possible even better deliveries than in the past. The general sales offices are being continued at 15 William street, New York City, and branch sales offices have been opened in the Morris building, Philadelphia, and the Merchants Exchange building, San Francisco. I. H. Levin continues in charge of technical and research work, and D. J. Tonkonogy in general charge of sales.

Edge Bill Stimulates Exchanges

Senate Passes Measure Which Would Permit New Trading Corporations to Finance Exports to Europe—Designed to Lend Sorely-Needed Aid to Disorganized Nations—Some Prefer Comprehensive Plan—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

THE recovery of the demoralized foreign exchanges which greeted the senate's passage of the Edge bill last week, though neither pronounced nor long sustained, at least served to indicate the importance of this measure as a possible remedy for the present unbalanced international financial conditions.

The bill would amend the federal reserve act to permit the organization of corporations of not less than $2,000,000 capital to do ordinary international banking and also with powers to issue debenture bonds based upon foreign securities. It is designed to provide a means for the advancement of credits to the disorganized nations of Europe, enabling them to purchase the food, the materials and the tools imperatively needed if starvation and chaos are to be prevented, and industrial rehabilitation accomplished.

How far the measure will go, if passed, in mending the sorry state of the exchanges remains to be seen. Some believe that the task is too stupendous to be left to the individual action of private corporations or groups of corporations, holding that one comprehensive nationally organized effort alone would suffice to bring the immediate corrective which the situation demands.

With the balance of exchange running so heavily against them during the war and since the armistice, European countries are finding their money at tremendous depreciation in America. The pound sterling is fluctuating between discounts of 12 and 15 per cent, the franc at above 40 per cent and marks at between 80 and 90 per cent. Consequently with such unparalleled premiums upon the dollar for purchases made in this country Europeans are being forced drastically to curtail expenditures here.

Exports Fall Off Sharply

As a consequence this country's exports are bound to decline. In July they were $350,000,000 less than in June. To what extent the curtailment was due to the exchange influence cannot be told with certainty until the August export figures are reported. Shipments to Europe in July fell 38 per cent, but exports to South America, where the dollar is near par, declined 39 per cent and to Asia and Japan, where the dollar is slightly depreciated, the decrease was even more. From this it would seem that the harbor strike in July probably shared with the exchanges the responsibility for the decrease in exports during that month.

The Edge bill or any other measure that may be devised can offer nothing more than a temporary relief for the world situation. It is essential that Europe be enabled to buy the things vital to its prosperity. It will not be possible, however, for this country to go on supplying the nations abroad with goods and credit indefinitely, despite the arguments that a credit plan is needed to maintain American exports at their present level.

As soon as Europe gets on its feet it will want to export to us and not import. To do otherwise would be to pile up such an enormous debt total that payment would be hopeless. It is only by sending goods and reducing the heavy excess of imports from this country that Europe can repair the shattered exchanges. Likewise thus only can we collect our huge final debt of from $12,000,000,000 to $15,000,000,000. The government alone up to Sept. 1 had extended credits to Europe totaling $9,684,272,567.

If the United States is to keep up its great export record, beyond the comparatively short time required to reconstruct Europe, it will have to look to other markets than Europe. From the humanatarian standpoint, credits to Europe now to save it from chaos are as important as in war, but the practical results, so far as our foreign trade is concerned, will be eventually to increase our imports and not our exports. This, of course, providing there is no complete industrial collapse abroad.

Some criticism has been directed toward the Edge bill because it does not provide for government participation. Exponents of the comprehensive financing plan, believe that the needs abroad are on too vast a scale to be met by private initiative and that the only way European resources can be pledged in order to command prompt credit in this country is through foreign government sources, supported by the United States government. They fear that the unco-ordinated efforts of a variety of corporations under the Edge bill, even if such companies are formed with sufficient speed, will represent a diffusion of effort where concentration is needed. The federal reserve board and other federal officials, however, are opposed to government participation although England has adopted a broad scheme of government aid to exporters to disorganized Europe.

Debentures May be Sold

The Edge measure as it stands permits producers in all lines to combine and organize trading corporations which can finance their foreign trade. Operations of such organizations will be under the supervision of the federal reserve board. Mortgages may be taken upon foreign properties and the American corporation may sell debentures the proceeds of which will go to pay the American exporter.

Senate amendments to the bill would tax the trading corporations as national banks; prohibit their dealing in foodstuffs or the dictation of prices to prevent competition; and make their stockholders liable in double the amount of their holdings for the obligations of the corporations. Another amendment eliminates the clause exempting the corporations from the provisions of the Clayton act. A bill passed by the house one week ago would permit national banks to invest up to 5 per cent of their resources in such corporations.

General Wire Co. Absorbs Another Producer

The Clinton-Wright Wire Co., which is to increase its capitalization from $12,500,000 to $16,000,000 and change its name to the General Wire Co., has taken over the Spencer Wire Co., with plants in Worcester and Spencer, Mass., one of the oldest industries of its kind in the United States. The new arrangements will occasion no change in the officials of the Clinton-Wright Wire

Co. or the new General Wire Co., except that Harry W. Goddard, president and treasurer of the Spencer Wire Co., succeeds George M. Wright as chairman of the board of directors. Mr. Wright, the former president of the Wright Wire Co., will remain upon the board of directors.

Several officials of the Spencer Wire Co. become identified with the new company, including Frank Kilmer, secretary and assistant treasurer, who has been elected treasurer, and George M. Thompson, manager, who has been elected a vice president and will have charge of the operation of the plants. Additional officers elected by the Clinton-Wright Wire Co. include Clarence D. Mixter, for many years credit manager of the Wright Wire Co., who has been made assistant treasurer; Charles H. Keenan, formerly chief clerk for the Morgan Spring Co., who is made auditor; Albert C. Lorion, purchasing agent for the Wright Wire Co., who has been made purchasing agent for all the plants, and Harry F. Hildreth, chief factory accountant.

Unite for Export

Washington, Sept. 16.—The Pipe Fittings & Valve Export association, organized under the provisions of the Webb-Pomerene act, has filed the necessary papers with the federal trade commission showing its members to be the Nelson Valve Co., Chestnut Hill, Pa.; the Malleable Iron Fittings Co., Branford, Conn.; the McNab & Harlin Mfg. Co., New York City; Stanley S. Flagg & Co., Philadelphia; the Pratt & Cady Co., Inc., Hartford, Conn.; the Jarecki Mfg. Co., Erie, Pa., and the Walworth Mfg. Co., Boston. Stanley S. Flagg Jr. is chairman of the new association with A. E. Rowe, secretary, and J. S. Mattimore, treasurer. The association's address is either in care of A. E. Rowe, Branford, Conn., or in care of J. S. Mattimore, Park Row building, New York City.

A. S. T. M. Establishes New Headquarters

According to a circular just issued to members of the American Society for Testing Materials, the establishing of headquarters in the building of the Engineer's club, Philadelphia, 1315-17 Spruce street, forecast in the last annual report of the executive committee, is now assured. The headquarters of the society will be on the third floor of the building, where extensive alterations are now being made. Pending the completion of this work, the society will temporarily occupy rooms on the first floor.

All correspondence with the society should now be addressed: American Society for Testing Materials, 1315 Spruce street, Philadelphia.

The society also announces the publication of the 1919 membership list, a booklet of 298 pages, and "A. S. T. M. Standards Adopted in 1919," a paper-covered pamphlet containing the 10 standards adopted in accordance with a recently canvassed letter ballot.

Obituaries

Alfred White, a machinery exporter, at 227 Fulton street, New York City, died recently at his home at 175 West Seventy-second street.

George A. Driggs, president of the American Pin Co., Waterbury, Conn., died at his summer home in Watch Hill, R. I., Aug. 28.

George G. Ferguson, chief expert steam fitting engineer of the American Radiator Co., Chicago, died Aug. 24 at his home in Dubuque, Iowa.

Edward A. Bannon, head of the welfare department of the Babcock & Wilcox Co., steam boiler manufacturers, died at his home in Bayonne, N. J., at the age of 44 years.

Oliver Wheeler Farrar, treasurer and general manager of the Granular Metal Co., Boston, operating a brass foundry in Roxbury, Mass., died at his home in Brookline, Mass., Sept. 1, aged 81 years.

Dwight P. Allen, an agent for the Standard Plunger Elevator Co., Worcester, Mass., died suddenly of apoplexy in Rochester, N. Y., Sept. 5. He was at one time superintendent for P. Blaisdell & Co., now part of the Whitcomb-Blaisdell Machine Tool Co., and also for the former Worcester Elevator Co.

Frank J. Patterson, Cleveland, well known as an owner of foundries, died Sept. 3, at the home of his sister in that city, after an illness of several months. From 1914 to 1918 he was owner of a machine shop in Philadelphia. Mr. Patterson was born in Cleveland 55 years ago and became associated with his father in the City Foundry Co., that city. Later he organized and was president of the Patterson Foundry Co., and of its successor the Ajax Foundry Co. Several years ago he bought a rolling mill in Wisconsin and in 1914 sold out and removed to Philadelphia, where he established a machine shop. Poor health caused him to retire last year. He was a member of the Philadelphia chamber of commerce and of the Duquesne club, Pittsburgh.

Benzol Active

Large Supplies Being Purchased—Prices Unchanged—Naphthalin in Demand

New York, Sept. 13.—Benzol again leads the list in the movement of coal tar products. Large quantities of pure and 90 per cent material, it is said, are still being bought, the rubber industry being especially active. Prices, however, remain unchanged, pure benzol holding at 24 to 29 cents and 90 per cent at 24 to 28 cents. Motor benzol can only be had for future shipment.

With cooler weather at hand, turpentine and rosin manufacturers are commencing to operate on a larger scale and are coming into the market for toluol on an increasing scale. As a result, the market presents a very firm tone. Toluol is quoted at 26 to 30 cents per gallon, and one degree toluol at 29 to 33 cents. Firmness also characterizes solvent naphtha, spot and contract business ranging 22 to 27 cents.

Fertilizer manufacturers continue to cover on good tonnages of sulphate of ammonia. With export demand dull, activity appears to be centered around these interests. No change is noted in prices. Contract sulphate holding at $3.25 to $3.40 per 100 pounds, and spot at $3.40 to $3.65.

With the exception of benzol, naphthalin is, possibly the most active of all coal tar products at the present time. The spot market has been virtually stripped of all supplies. This situation is attributable largely to the heavy buying of the dye industry. Prices, despite this continuous activity, are unchanged. Flakes are holding at 6½ to 7½ cents, and balls at 8½ to 9½ cents.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Tuluol	.26 to .30

Tool Trade Calm Toward Strikes

Labor Disturbances on Machine Industry's Horizon Cause But Little Holding up of Business—Machinists' Threats Are Watched—Firestone Tire Issues New List—Locomotive Companies Buy Tools and Cranes

UNRUFFLED to any appreciable extent by numerous strike threats, the machine tool market is forging ahead. It is true, however, that some holding back of orders until the situation becomes clarified is noted particularly in heavy equipment in the Pittsburgh district, but on the whole, the possibility of a general strike is discounted. Possible strikes among machinists are receiving the most attention. In the East, a 25 per cent increase on Oct. 1 has been demanded. Some northern New Jersey plants have ceased to operate. A strike in Cincinnati is threatened and toolmakers there are not guaranteeing deliveries.

Business coming to machine tool sellers consists chiefly of numerous inquiries for single tools and small lots and frequent orders of similar size. The automotive and allied industries continue in the lead as buyers. In the East, however, the Baldwin Locomotive Works, Philadelphia, is the biggest buyer, taking an assortment of tools, including $25,000 worth of drilling and grinding machines. The Standard Oil Co. has placed its order for 50 tools for Roumania, with one New York seller and delays action on its punching and shearing equipment. In Pittsburgh, the Duquesne Light Co., Cheswick, closed on a number of tools, while in Cleveland, various small purchasers have placed orders. The largest inquiry current in the Middle West outside of those which still are hanging fire from previous weeks, is one for 14 tools from the Firestone Tire & Rubber Co., Akron, O. Montgomery, Ward & Co., Springfield, Ill., has placed orders for its engine plant equipment and the Studebaker Corp. ordered its requirements in Detroit for its Detroit and South Bend plants. Smaller inquiries in Cleveland come from the J. H. McClain Co., Canton, who wants hand power traveling jib cranes, portable hoists, etc.; Armstrong, Blum & Co., Chicago, miscellaneous equipment, and the Economy Baler Co., Ann Arbor, Mich., four tools.

Chicago buyers returned from sales in the East of the American Can Co, and the Eddystone Munitions Co., having booked but a few machines, since prices were too high. These buyers have been informed that the Moline Tractor Co. will fill its requirements from government-owned machines and that they will only be about half of what was originally announced. Other tractor concerns to buy in the West are the Samson Tractor Co., Janesville, Wis., and the Holt Mfg. Co., Peoria, Ill.

Prices on tools are on a wartime level in Pittsburgh and in New York recent advances include one of 12½ per cent on turret lathes, one of 10 per cent on upright drills and one of 15 per cent on radial drills.

Most crane business is prospective although the American Locomotive Co. ordered 15 overhead cranes from the Shaw works at Muskegon, Mich., for Montreal, Schenectady, N. Y., and Chester, Pa. The Robins Conveyor Belt Co., New York City, made a small crane purchase as did the Pittsburgh Crucible Steel Co., Midland, Pa. The Slick-Knox Steel Co., Wheatland, Pa., ordered a number in Cleveland. The Interstate Iron & Steel Co. is inquiring in Pittsburgh for five cranes. Other small inquiries come from the Diamond Alkali Co., Pittsburgh; Cambria Steel Co., Johnstown, Pa.; American Steel Foundries, etc. Prospective purchasers include the Kelly-Springfield Tire Co., Cumberland, Md.; the Central Tube Co., Economy, Pa.; the Firestone Tire & Rubber Co., Akron, O.; the Upson Board Co., Lockport, N. Y.; and the Pusey & Jones Co., Wilmington, Del., which is to erect two large drydocks at Gloucester City.

Labor Situation Disturbs Eastern Tool Buying

SELLERS of machine tools in the east continue to report a fairly good volume of small orders. Large lists, they assert, are virtually nil, but contracts for one or two machines are quite numerous. A tendency still exists among some buyers, however, to hold off owing to labor trouble. In some plants, especially in northern New Jersey, operations have been suspended entirely. That about 33,500 machinists in Brooklyn will demand a 25 per cent increase in wages Oct. 1 is a probability which points to further difficulty in the more immediate vicinity of New York.

Possibly the largest buyer of the past week has been the Baldwin Locomotive Works, Philadelphia, which has bought an assortment of machine tools, including about $25,000 worth of special drilling and grinding machines. The Standard Oil Co., after several weeks delay, has finally placed the formal order for about 50 machine tools for shipment to Roumania. This business went, in its entirety, to one New York seller. Action on the punching and shearing equipment required for that country is still pending.

Measures now being taken by the railroad administration for returning the railroads to their owners on Dec. 31 are adding an optimistic note to sentiment in the equip-

ment market. While it is realized it may be many months before a heavy volume of railroad buying sets in, the first material move of Director General Hines for the return of the railroads, in the nature of a request for the inventory of supplies, is being regarded with considerable satisfaction after the long period of uncertainty and delay. Railroad demand at the present time is being confined principally to small orders. Included in current railroad inquiries is a list of several machines for the Pennsylvania railroad.

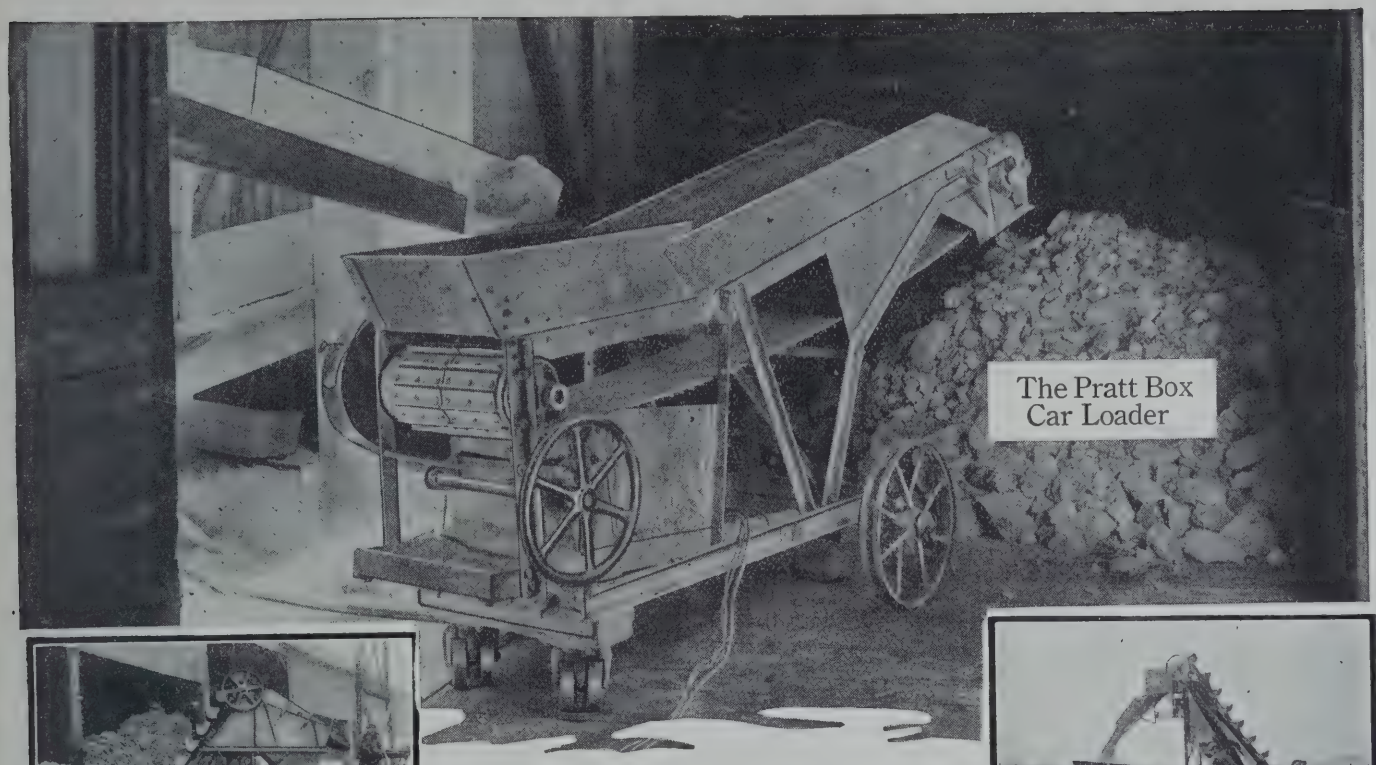
It is understood that a line of turret lathes has been advanced approximately 12½ per cent. One maker of upright drills is said to have boosted prices about 10 per cent, and a line of radial drills has increased 15 per cent. Aside from these instances, no price changes of moment have been noted.

The award of 15 overhead cranes by the American Locomotive Co. constitutes the largest contract to be placed within the past week in the eastern crane market. This business went, in its entirety, to the Shaw Electric Crane Co., Muskegon, Mich. Of these cranes, two 10-ton cranes and one 20-ton were for Montreal; one 30-ton, one 15-ton, and one 10-ton crane for Schenectady, N. Y.; and six 10-ton, two 30-ton and one 20-ton crane for Chester, Pa. Another order to be placed is one involving two 10-ton cranes, of 48 and 58-foot spans respectively, for the Passaic, N. J., plant of the Robins Conveyor Belt Co., 13 Park Row, New York City. The Bedford Foundry & Machine Co., was the successful bidder. The Worcester Pressed Steel Co., Worcester, Mass., has placed its order for a 5-ton crane with 30-foot span with the Northern Engineering Works, Detroit, while the Newport News Shipbuilding & Dry Dock Co., Newport News, Va., has awarded a 10-ton overhead crane with 56-foot span to the Niles-Bement-Pond Co., New York.

Included in prospective business is some conveying equipment for the new plant of the Upsom Board Co., Lockport, N. Y. It is understood that at least one overhead crane will be required. The Aberthaw Construction Co., is in charge of construction, through its Buffalo offices. Another development of interest to eastern crane sellers is the announcement that the Pusey & Jones Co. will spend approximately $3,800,000 on its Gloucester City shipyard. It is the intention of the company, according to William G. Cox, general manager, Wilmington, Del., to install a complete ship repair works, including two drydocks, one with a capacity of 3000 to 6000 tons and the other with 10,000 tons. Peate Bros., Flushing, L. I., contractors, are in the market for a 15-ton new or used locomotive crane.

Frequent Though Small Sales Made at Pittsburgh

FAIR sized demands still are noted in the Pittsburgh district for machine tools. Neither the fact that prices are back close to the war levels or that as builders become filled up and are extending delivery dates is proving much of a deterrent to sales. The Duquesne Light Co. closed recently for a number of tools for its new plant at Cheswick, Pa., while individual tool orders continue to pour in freely upon dealers.



In the heavier lines, business is better in the prospective than in the actual. While the more general belief is that a general steel plant strike is improbable and that even if the men are called out, too few men will respond to result in anything more than a partial and short-lived suspension of operations, it appears that a desire to see a definite clearing up of the situation is delaying orders in connection with a number of steel plant installations. It is expected, however, that the Diamond Alkali Co., which is in the market for a crane will close shortly and that orders in connection with the plant extensions now under way at the Cambria Steel Co., Johnstown, Pa., are not far off. The Pittsburgh Crucible Steel Co., Midland, Pa., probably will close on a bucket crane in a few days. The Slick-Knox Steel Co., Wheatland, Pa., has closed for a number of cranes, with the Cleveland Crane & Engineering Co., Wickliffe, O. The Interstate Iron & Steel Co. has an inquiry out for five cranes.

Other prospective business includes equipment for the new automobile spring plant of the American Steel Foundries, the new plant of the Kelly-Springfield Tire Co., Cumberland,

Machinery Exports Reduced 48.4 Per Cent

EFFECTS of the low exchange rates abroad and harbor strikes in New York upon the foreign trade of the United States are clearly indicated by the greatly decreased machinery exports for July as compared with June. In June the total value of machines exported was $8,606,565 while in July equipment valued at only $4,440,819 went out of the country. This is a difference of 48.4 per cent. Lathe exports were reduced more than 50 per cent; shipments of other machine tools as well as sharpening and grinding machines were approximately the same for the two months; while all other metalworking machinery fell from $5,129,486 in June to $2,056,701 in July. France which has led the foreign countries in purchases in America for several months, in July gave way to England, which has held second place. France now is second and Belgium third. England took $1,475,698 worth; France $1,130,486 and Belgium $558,038. Perhaps the greatest reduction to be noted is in the case of China. Comparative figures for June and July are $967,417 and $10,385 respectively. A complete table follows:

	Lathes		Other Machine Tools		Sharpening and Grinding Machines		All other Metalworking Machinery		Total	
	July	June	July	June	July	June	July	June	July	June
France	$107,663	$ 254,089	$ 235,944	$ 282,878	$174,644	$181,755	$ 612,235	$1,302,460	$1,130,486	$2,021,182

Md., and for the extension to the plant of the Central Tube Co., Economy, Pa.

Moline Plow to Take Government Tools

SALES of machine tools in the Chicago district are on a heavy scale with most business continuing in small sales. It develops that the Moline Tractor Co., which needs considerable equipment to replace that damaged in a recent fire, will buy only about half as much as it had in the plant at the time of the fire, since its post-war requirements are considerably less. It also develops that under the direction of George N. Peek, its new president, the company will place most of this business with the government, taking machines thrown back in war settlements. The Samson Tractor Co., at Janesville, Wis., has covered pratically all of its requirements with the exception perhaps of a few tools of minor nature.

Western buyers have returned from the east where they attended sales by the American Can Co. and the Eddystone Munitions Corp., but they booked little of this equipment because prices appeared too high. It is believed considerable more equipment of this sort will come out shortly, as soon as government settlements with manufacturers are completed. Considerable equipment from the plant of the American Can Co., near New York City, was bought for shipment to Honduras. The Studebaker Corp. has covered the greater part of its requirements for the South Bend plant through Detroit dealers. The Holt Mfg. Co., Peoria, Ill., has bought part of its requirements for its tractor plant addition. Montgomery Ward & Co| have placed orders for equipment for an engine plant at Springfield, Ill. The Santa Fe railroad has not yet closed on the few tools inquired for.

The Moline Forge & Mfg. Co., Moline, Ill., will build a machine shop. The Burd High Compression Ring Co., Rockford, Ill., will build an addition to its plant.

Tool Inquiries and Sales Are of Fair Size

WERE it not for the fact that the present unsettled state in labor circles generally, is acting as a brake upon the machine tool industry, sellers in Cleveland believe they would be facing the same condition as regards deliveries that obtained two years ago at the height of the war activity. As it is, the numerous inquiries being received serve to indicate that many industries are going ahead with expansions despite disturbances and frequent orders, while the demands for single tools or small lots, indicate a healthy situation. Machine tool interests refuse to believe that a general strike in the iron and steel industry will be called but see signs of further disturbances among machinists. It was reported that machinists in Cleveland would walk out because some machine shops were doing work for Akron, whose machinists were on strike. A strike among machinists in Cincinnati is considered as a possibility and makers of machine tools there are taking orders but are not guaranteeing deliveries.

While not very large, another list from the Firestone Tire & Rubber Co., Akron, O., for general machine shop equipment, now is the biggest new inquiry before dealers. It comprises 14 tools, including lathes, drill press, milling machine, shaper, radial drill, arbor press, etc. Another fair sized list comes from Armstrong, Blum & Co., Chicago, manufacturer of hacksaws, etc. A smaller list from the Economy Baler Co., Ann Arbor, Mich., calls for one heavy duty radial drill, one 42-inch vertical boring mill, a fair sized gear cutting machine and a shear suitable for cutting ¼-inch plate disks, 3 feet in diameter. The White Sewing Machine Co., Cleveland, wants a 14-inch x 5-foot stud lathe. The Slick-Knox Steel Co., Sharon, Pa., desires to locate a 96 to 120-inch double geared press, with platen from 48 to 60 inches wide. The press is to have a 20-inch minimum stroke with a capacity of from 1000 to 2000 pounds. The C. M. Yoder Co., Cleveland, manufacturer of special machinery, wants one 4-foot plain radial drill. The B. F. Goodrich Co., Akron, O., which is in the market for a quantity of machinery, is making strong efforts to locate a 4-inch pipe machine, and has even wired the Cleveland chamber of commerce. Other Akron companies who remain in the market for equipment are the Goodyear Tire & Rubber Co., the Firestone Steel Products Co., the Crescent Garage & Machine Co., and the Summit Welding Garage & Machine Co. The Wellman-Seaver-Morgan Co., Cleveland, is taking quotations on multiple spindle drills for its tractor project at Akron, for which a quantity of both special and standard equipment will be required. This has not progressed sufficiently far to bring out a formal list. The Ohio Pottery & Glass Co., 5211 Euclid avenue, Cleveland, has not closed on its small list noted last week, and so far as can be learned the Safety Mfg. Co., Alexandria, Va., still is in the market for one 3 x 36-inch double spindle lathe; one 16-inch x 5-foot tool room lathe with taper attachment and compound rest; one 18-inch or larger surface lathe; one heavy short lathe 18 or 20-inch swing, 24 to 30 inches between centers; one 16 or 18-inch shaping machine; one single spindle sensitive drill; one 30 to 36-inch sliding head drill press; one 30 x 30-inch x 12-foot single or double head planer; one new or used geared crank hack saw, capacity 5-inch diameter. The Guide Motor Lamp Mfg. Co., Cleveland, wanted a 30 to 48-inch square power shears. Used polishing lathes are sought by the Aetna Brass Mfg. Co., that city. The Kappa Machine Co., Louisville, Ky., wants a machine for reboring auto cylinder blocks.

Several fair sized sales have been made by various dealers during the past week. Small purchasers include the Federal Machine & Products Co., Cleveland, which ordered a 3-foot radial drill, and the Peninsular Auto Parts Co., Detroit. The Cadillac Motor Car Co., Detroit, purchased among other tools, two No. 13 drilling machines, while the White Motor Co., Cleveland, added one No. 1 Blount grinding machine to its purchases. The Colburn Machine Tool Co., Franklin, Pa., which is to remove to Cleveland, bought a No. 14 drill press with plain table. It is understood that a site for its Cleveland plant has been purchased on East 152nd street, and plans are being prepared. Equipment is being bought by the Byron Engineering Works, Louisville, Ky., to make auto trailers.

Automobile companies continue expansion programs. The Nash Motors Co., Kenosha, Wis., has bought 20 acres and will erect a plant. The Hudson Motor Car Co., Detroit, is to spend $1,000,000 on equipment and $1,250,000 in new buildings. The Brown Body Corp., Cleveland, has selected its site, 200 x 1000 feet, on which it will erect a $500,000 building.

Several machine shop projects are interesting to dealers at this time. The Homer Engineering Co., Canton, O.; the Carbondale Machine Co., Carbondale, Pa.; Wilcox Machine Co., Shadyside, Bellaire, O.; all are erecting shops of various sizes.

The prosperity of the automotive industries continues to be evidenced by the new buildlings and additions which are being erected. The Lorain Steel Stamping Co., Lorain, O., A. Bregman, general manager, will erect a plant soon; the Vita Mfg. Co., Williamson building, Cleveland, will construct a plant 132 x 252 feet to manufacture magnetoes and automobile specialties; the Wheeler Automatic Transmission Co., Indianapolis, will build a plant to make transmissions which will do away with the shifting of gears; the Ovee Mfg. Co., Louisville, Ky., will build a $50,000 plant to manufac-

Kreodone
EVERLASTING

WOOD BLOCK FLOORS

— stand for changeless quality and unequalled service everywhere

BOTH *special quality* and *longer service* are based on the exclusive use of *long-leaf*, yellow pine and its treatment, in block form, with a *pure, unadulterated creosote oil.*

Our engineers and chemists insist on an unadulterated creosote oil. Why? Because they know floors of all kinds "inside out."

Yes, we know floors. Why shouldn't we? We made the first wood block floor ever laid in the United States—and we have been in the business continuously for nearly three decades since then.

We offer you freely the services of our Engineering Department. Ask for a survey and analysis of your plant floors.

You cannot fail to benefit in the saving of money and trouble. *The service is free.*

Write for our free, illustrated booklet showing KREODONE Floors a success under specially hard conditions.

Peerless Motor Car Co., Cleveland, Ohio. We have several repeat orders from this plant.

Get the *Genuine KREODONE* Blocks
Watch that Spelling—it means Service

ture automobile supplies; the Robert H. Hassler Co., Indianapolis, will increase its capacity for making automobile parts; and the Curtis Airplane Co., New York City, has leased a building in Waukegan, Ill., to manufacture airplanes as soon as equipment and machinery can be installed.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

ROCKLAND, ME.—The East Coast Fisheries Co. contemplates building a machine shop, drydock, oil and fertilizer reduction plant and an ice making and refrigerating plant.

BOSTON.—The Murphy Shipbuilding Co. has been incorporated with $80,000 capital by James Bailey, Richard A. Murphy and L. E. Murphy.

BOSTON.—Plans are being drawn for a 1-story, 400 x 500-foot plant, a 1-story, 161 x 400-foot shipping and receiving building, a 4-story, 60 x 120-foot office building and a 2-story, 84 x 87-foot power house, for the Nelson Corp.

CAMBRIDGE, MASS.—The Riverside Boiler Works will build a 2-story, 85 x 90-foot warehouse.

EAST BOSTON, MASS.—The Simpson-Patten Dry Dock Co. will build a 2-story, 40 x 120-foot carpenter shop.

EAST BRAINTREE, MASS.—The contract has been let for a $3,000,000 oil refining plant for the Massachusetts Oil Refining Co.

EAST WHITMAN, MASS.—The National Foundry Co. is to build a 70 x 120-foot addition.

GREENFIELD, MASS.—The American Tap & Die Corp. plans a 1 and 2-story addition, to cost about $35,000.

LOWELL, MASS.—The United States Bobbin & Shuttle Co. will build a 3-story, 45 x 80-foot storage building.

NEWTON, MASS.—The Saco-Lowell Shops has let the contract for a 1-story, 160 x 200-foot addition to its automatic building.

QUINCY, MASS.—The Pneumatic Scale Corp. has let contracts for a machine shop, tool office and boiler house addition, to cost $55,000.

SPRINGFIELD, MASS.—The National Equipment Co. contemplates a plant addition, 3-stories, 15 x 350 feet, to cost $100,000.

SPRINGFIELD, MASS.—The Reed Gauge Co. has been incorporated with $10,000 capital by Louis Reed, Frederick A. Calderwood and E. N. Worthen.

TAUNTON, MASS.—The L. C. Blanke Twist Drill Co. contemplates a plant addition, 1-story, 50 x 112 feet.

WALTHAM, MASS.—The Waltham Blearchery & Dye Works will build a 2-story, 50 x 120-foot machine shop.

WATERTOWN, MASS.—Bids close Sept. 22 for a 1-story, 100 x 445-foot storehouse for tools at the United States arsenal, this being in addition to the proposed storehouse for machinery.

CRANSTON, R. I.—The Massachusetts Steam Specialty Co. has been organized by Wallace E. Tillinghast, 627 Park avenue, and others.

RIVERPOINT, R. I.—B. B. & R. Knight, Inc., plans the erection of two mills, one, 3-stories, 150 x 500 feet, with a carpenter and machine shop and a power plant.

WOONSOCKET, R. I.—The Woonsocket Wagon Works has plans for a 1-story boiler plant.

BRANFORD, CONN.—The Malleable Iron Fittings Co. has started on a 1-story, 23 x 92-foot extension.

BRIDGEPORT, CONN.—The Bryant Electric Co. will build a 4-story, $125,000 addition.

BRIDGEPORT, CONN.—The G. Drouve Co., sheet metal products, has awarded contracts for a new plant, 120 x 200 feet, with extension, 30 x 80 feet, and an office building, 40 x 42 feet.

BRIDGEPORT, CONN.—The Locke Steel Belt Co. has let the contracts for a 1-story, 70 x 150-foot storage warehouse.

DANBURY, CONN.—Doran Bros. recently let a contract for a 90 x 200-foot machine shop.

EAST NORWALK, CONN.—The Crofut & Knapp Co., South Norwalk, plans to build two plant additions, 5-stories, 60 x 300 feet, and 3-stories, 210 x 300 feet. A power plant, 60 x 150 feet, will also be erected.

HARTFORD, CONN.—The Whitlock Coil Pipe Co. has awarded a contract for a machine shop, 1-story, 48 x 71 feet, to cost $15,000.

HARTFORD, CONN.—The Hall Thompson Co., 844 Windsor street, has plans for a 3-story addition, 35 x 60 feet, to cost $26,000.

MERIDEN, CONN.—The M. B. Schenck Co., division of the Bassick Co., Bridgeport, Conn., iron founder, has let the contract for an addition, 55 x 65 feet.

WEST HAVEN, CONN.—Bids have closed for a 2-story, 44 x 100-foot machine shop for the New Haven Machine Co.

North Atlantic States

ALBANY, N. Y.—The Kelly-Dennin Co. is planning a 1-story machine shop and auto service works, 150 x 150 feet, to cost $50,000.

BABYLON, N. Y.—The Parker Plate & Machinery Co. has been incorporated with $10,000 capital, by W. R. Bross, E. B. and J. W. Eaton.

BROOKLYN, N. Y.—The Waterbury Co., 132 Taaffe place, wire rope, has plans for a 1-story plant addition, 17 x 139 feet.

BROOKLYN, N. Y.—The White Metals Specialties Corp., metal tubes, has been incorporated with $100,000 capital, by T. W. Constable, R. L. Gray and M. M. Kotzen, 51 Chambers street.

BROOKLYN, N. Y.—The Tunley Machine & Tool Works, Inc., has been chartered ith $10,000 capital, by E. H., M. D. and W. S. Tunley, 160 Albany avenue.

BROOKLYN, N. Y.—The Gehnrich Indirect Heat Oven Co., 60 Franklin street, has acquired additional property, on which it is reported planning to erect a new plant.

BUFFALO.—The A. F. Oliver Gear & Machine Co., 60 Cherry street, has plans for a 1-story plant addition, 50 x 60 feet, to cost about $10,000.

BUFFALO.—The Wire Wheel Co. of America, has plans for four buildings besides the one now under construction.

BUFFALO.—The Buffalo Body Corp., auto and carriage bodies, recently was incorporated with $1,000,000 capital, by K. B. Macdonald, R. J. Mackenzie and W. R. Daniels.

BUFFALO.—The Ferguson Steel & Iron Corp., boat building, recently was incorporated with $963,500 capital, by B. L. Worden, R. A. Kellogg and E. M. Knauth.

CORTLAND, N. Y.—The Edlund Machinery Co. has increased its capital from $63,000 to $157,500, and according to a report will increase the capacity of its plant.

GENEVA, N. Y.—The O'Malley Motor Co. contemplates a 3-story machine shop, 50 x 100 feet, to cost $50,000.

FALCONER, N. Y.—The Falconer Iron Works has awarded a contract for an additon, 2-stories, 40 x 120 feet.

MERRICK, N.Y.—The Merrick Steel Products Corp. has been incorporated with $10,000 capital, by M. Bloss anl C. Deitzel.

NEW YORK.—The Metropolitan Chain Corp. has been organized by J. Mesnick and I. Freedman, 1791 Gleason avenue.

NEW YORK.—The B. & A. Machine Co. has been organized by M. E. Archer, Ralph Q. Kelly and C. Uslan, 260 Grafton street, Brooklyn, N. Y.

NEW YORK.—The J. Edward Ogden Co., 147 Cedar street, door mechanisms, etc., has plans for a 1-story addition, to cost about $12,000.

NEW YORK.—The Arrow Metal Bed Corp. has

been incorporated with $10,000 capital, by J. and W. Greenblatt and F. Topper, 235 West 112th street.

NEW YORK.—The S. G. V. Electrical Co. has been incorporated with $10,000 capital, by J. Goldfarb, J. and M. Knapp, 136 Broadway.

NEW YORK.—The General Ash Can & Metal Ware Co. recently was incorporated with $10,000 capital, by I. J. Friedman, I. A. Ruskin and J. Klein, 12 West Twenty-seventh street.

NEW YORK.—The Consolidated Products Co., forging and oil mill machinery, has been incorporated with $15,000 capital, by W. M. Sheldon, J. Guter and A. M. Kahn, 1051 Boston road.

NEW YORK.—The Continental Castings Corp. has been incorporated with $250,000 capital, by H. O. Bonner, F. E. Beidler and J. J. Flannery, 149 Broadway.

NEW YORK.—The Bertolini Motor Carburetor Co. recently was incorporated with $100,000 capital, by B. Venusti, S. Mangiapane and J. Coppola, 291 Broadway.

NEW YORK.—The Motorware Mfg. Co., auto accessories, has been incorporated with $10,000 capital, by R. and R. I. Isaksen, L. M. Schwartz, 1159 East Parkway, Brooklyn, N. Y.

NEW YORK.—The Selective Gas Process Co. has been incorporated with $300,000 capital, by J. A. Carney, J. B. Quinlan and G. W. Colton, 196 Berkeley place, Brooklyn, N. Y., to manufacture gas machinery.

NIAGARA FALLS, N. Y.—The Nypano Specialties, Inc., efficiency devices, has been incorporated with $40,000 capital, by J. E. Bossard, C. L. Webb and W. S. Smith.

ROCHESTER, N. Y.—The General Railway Signal Co. has awarded a contract for a foundry addition, 110 x 220 feet.

ROCHESTER, N. Y.—The Burke Steel Co., Scherer street, has completed plans for a 1-story forge shop, 48 x 60 feet.

ROCHESTER, N. Y.—The Davenport Machine Tool Co. has been incorporated with $625,000 capital, by W. S. Davenport, C. R. Burt and C. W. McKay.

ROCHESTER, N. Y.—The Rochester Blower Pipe Co. has been organized with $15,000 capital, by C. G. Diehl, A. I. Bull and Frank J. Weinmann, 483 Colvin street.

SYRACUSE, N. Y.—The H. H. Franklin Mfg. Co. has had plans drawn for a plant addition.

SYRACUSE, N. Y.—The Durston Gear Co., 213 Maltbie street, has arranged for a 2-story addition, 75 x 200 feet, to cost $15,000.

SYRACUSE, N. Y.—The Syracuse Chilled Plow Co. recently was incorporated with $300,000 capital. The company operates a plant at 111 Wyoming street.

SYRACUSE, N. Y.—The Gabrielson Mfg. Corp., milling, machine, foundry and factory supplies, has been incorporated with $50,000 active capital, by A. Meldrum, M. V. White and C. Gabrielson.

SYRACUSE, N. Y.—Local interests have organized the Gutliph-Knapp Pattern & Casting Co., Inc., with a capital of $25,000. Directors are William H. Gutliph, John R. Sheldon, John Pickard and Charles E. Knapp.

ALLENTOWN, PA.—The Penn Foundry & Machine Co. is reported to be planning the organization of a subsidiary company at Bath, Pa.

CARNEGIE, PA.—The Adler Stove & Range Co. has been acquired by the Keighley Mfg. Co., formerly of Follansbee, W. Va.

LANCASTER, PA.—The Monitor Bi-Loop Radiator Co. is having plans prepared for a 2-story building, 45 x 65 feet, to cost $20,000.

MANHEIM, PA.—The Bond Foundry & Machine Co. contemplates an addition, 25 x 150 feet, to cost $20,000.

PHILADELPHIA.—The T. S. Johnson Sons Co., 622 Cherry street, metal products, is taking bids for a 2-story shop addition, 44 x 50 feet.

PHILADELPHIA.—The Hale & Kilburn Corp., Eighteenth and Lehigh streets, plans a 5-story plant addition, 196 x 260 feet, to cost about $100,000.

PHILADELPHIA.—The Kensington Copper & Machine Works has plans for a 1-story shop, 48 x 100 feet.

PHILADELPHIA.—Thomas Mills & Bro., Inc., Eighth and Thompson streets, bakers' tools, has plans for a 2-story addition, 21 x 24 feet.

PHILADELPHIA.—The Penn Rivet Corp., Eleventh and Cambria streets, has acquired a 5-story building, which it plans to utilize as an addition.

PITTSBURGH.—Fire recently damaged the pattern shop of the Springfield Foundry Co., 3207 Smallman street.

Government Inquiries

BIDS on the following equipment are desired by the navy department, bureau of supplies and accounts:

One oilstone grinder, three wood trimmers, one double spindle shaper, one band saw, one sanding machine, two patternmakers' lathes, one jointer, one saw table, one single cylinder surfacer, two jointers, one mortiser and borer and spare parts, 4528, Puget Sound.

Furnishing and installing pumping system and auxiliary equipment for operating a gun forging and bending press, 4533, South Charleston, Oct. 7.

One steam hammer, one forging press, one bending roll, one crimper and beader, one plate machine, one forming machine, one cornice brake, two vertical and hand punches, one vertical shear, hand bench and squaring shear, 4534, Puget Sound.

Schedule numbers, dates of opening and places of delivery follow the specification of the tools.

PITTSBURGH.—The Radner & Dinger Co., Second avenue, sheet metal works, has acquired on a site on which it is reported planning a new plant.

PITTSBURGH.—The Nyap Machine & Engineering Co., 605 Standard Life building, has been organized and will manufacture a patented wrench. Equipment for its plant is now being purchased. R. H. Laury is president.

PORT ALLEGHENY, PA.—This town is considering a municipal electric light plant.

YORK, PA.—A 1-story machine shop will be erected by the Pfaltzgraff Pottery Co.

BELLEVILLE, N. J.—The Eastwood Wire Mfg. Co. is having plans prepared for a 2-story addition, 35 x 45 feet, to cost $15,000.

BELVIDERE, N. J.—A movement is on foot to build a new foundry for the manufacturers of iron and brass castings. Oscar Smith, formerly of the Ingersoll-Rand Co., is at the head of the project.

BLOOMFIELD, N. J.—A $200,000 chemical plant will be erected here by Lehn & Fink.

EAST ORANGE, N. J.—The Sims Magneto Co. will erect an addition, 67 x 153 feet, to cost $59,000.

ELIZABETH, N. J.—The Duesenberg Motor Corp. is having plans drawn for additions.

JERSEY CITY, N. J.—The Harrison Bolt & Nut Co. recently was incorporated with $100,000 capital, by A. F. McCabe, O. J. Skinner and N. H. McLoren.

NEWARK, N. J.—The Terminal Pattern & Model Works, 8 Railroad place, will make alterations to its plant.

NEWARK, N. J.—James Mitchell, Jersey City, has the contract to erect a plant for the Prest-O-Lite Co. The largest of the buildings will be 60 x 400 feet, and the smallest, 30 x 40 feet.

NEWARK, N. J.—A contract for a $400,000 service station for the White Co., Long Island City, L. I., has been awarded the American Concrete Steel Co. The building will be 200 x 400 feet.

NEWARK, N. J.—The Aeolian Co., musical instruments, New York, has purchased property on which to erect a plant. The first structure will be 100 x 400 feet.

NEWARK, N. J.—For the purpose of manufacturing machinery, the Sun Co. recently was organized with $25,000 capital. Frank J. McManus and William Tunick, 1408 Sterling place, Brooklyn, are among the incorporators.

TRENTON, N. J.—The Composition Machinery Corp. has been chartered with $100,000 capital by C. F. Burroughs, J. A. Bernhard and Carl Fergus.

WASHINGTON, N. J.—The Bay Way Foundry, Inc., has been incorporated with $200,000 capital, by William E. A. Wheeler and others.

WILMINGTON, DEL.—Aproximately $4,000,000 will be spent at the Gloucester City plant of the Pusey & Jones Co., according to a recent anouncement by William G. Cox, general manager. Plans have been made for turning half the plant into a repair plant with two large drydocks, one with a capacity of 3000 to 6000 tons and the other 10,000 tons.

BALTIMORE.—The Maryland Casualty Co., Baltimore street, will build an electric light plant here.

BALTIMORE.—The Baltimore Gas Appliance & Mfg. Co., Bayard and Hamburg streets, has arranged for a 1-story addition, 25 x 133 feet, to cost about $10,000. H. W. Hunter is president.

HAGERSTOWN, MD.—The Bostwick-Lyon Bronze Co. is reported planning to improve its plant.

RICHMOND, VA.—The Tower-Binford Electric & Mfg. Co., Fourth and Clay streets, is planning a 1-story building, 90 x 116 feet, to cost $35,000.

Central States Activity

APPLETON, WIS.—The Badger Furnace Co. will enlarge its gray iron foundry. H. J. Schlegel is president and manager.

FT. ATKINSON, WIS.—The James Mfg. Co., steel stanchions, etc., is reported planning plant improvements, which include malleable and gray iron foundries, as well as additions to the machine shop, sheet metal department and other shops. The first addition will be 100 x 450 feet. W. D. James is president and general manager.

HORICON, WIS.—The Ideal Barn Equipment Co. contemplates the installation of additional equipment and the construction of a shop extension.

MILWAUKEE.—The Electric Carpet Washer Co. has been organized with $25,000 capital, by J. A. Barry, E. G. Patek and John F. Bluemm, to manufacture elctric domestic appliances.

MILWAUKEE.—The American Radiator Co., 820 South Michigan avenue, Chicago, will build a warehouse here, 94 x 180 feet.

MILWAUKEE.—The Milwaukee Concrete Mixer Co. has let contracts for an addition, 35 x 330 feet. George R. Bambach is secretary.

MILWAUKEE.—The Milwaukee warehouse of Jos. T. Ryerson & Son, Chicago, is undergoing improvements, including a new unloading platform and other provisions for receiving, storing and handling material.

SHEBOYGAN, WIS.—The Globe Foundry Co. recently was incorporated with $100,000 capital by

G. F. Honould, G. A. DeWilde Jr. and Fred Leicht A modern gray iron foundry will be erected. C. B. Schneible, 1312 Farwell avenue, Chicago, is sales engineer.

ANN ARBOR, MICH.—The King-Seeley Corp. has been chartered with $50,000 capital to manufacture metal products, by Halstead Seeley and others.

DETROIT.—The Norde Mfg. Co. has been chartered with $100,000 to make auto parts, by Frank M. Pauli, 534 Sheridan avenue.

DETROIT.—The Ackwell Products Co., oiless bearings, recently was incorporated with $10,000 capital, by E. L. Ackwell, C. T. Fezzey and Irving E. Welch.

DETROIT.—The Atlas Machine Works has been incorporated with $5000 capital by E. F. Wilkinson, 207 Tennyson avenue and others.

DETROIT.—The American Steel Products Co., Inc., has been chartered with $30,000 capital by Walter I. Oeschger, 200 McLean avenue and others.

DETROIT.—The Tube Products Co. has been chartered with $25,000 capital by R. C. Jacobs, 200 East Grand boulevard and others.

Detroit.—The Hexagon Drill Co. has been incorporated with $300,000 capital, by J. W. Donaldson, 409 Free Press building and others.

DETROIT.—The Liberty Carburetor Co. recently was incorporated with $15,000 capital, by C. A. Brissette, 147 Palmer avenue and others.

DETROIT.—The Economy Tool Salvage Co., capitalized at $10,000, recently was incorporated by Joseph C. Cook, 596 Cass avenue.

DETROIT.—The Michigan Motor Specialties Co. is having plans drawn for a boiler house, 1-story, 38 x 40 feet.

DETROIT.—The Packard Motor Car Co. has awarded a contract for a plant addition, to cost $500,000.

MANISTEE, MICH.—The Manistee Drop Forge Co., P. P. Schnorbach, president, capitalized at $200,000, has been chartered.

CHICAGO.—The Hamler Boiler & Tank Co., 3908 South Halsted street, is having plans prepared for a 1-story building to cost $50,000.

CHICAGO.—C. W. Kallal, 1017 City Hall, is preparing plans for an engine room and transformer station costing $300,000.

CHICAGO.—The Super-Power Piston Ring Co. plans a plant. J. F. Seib of the Modern Die & Plate Press Mfg. Co., heads the new company.

CHICAGO.—The Wahl Co., manufacturer of adding machines, 1800 Roscoe street, has awarded a contract for a 5-story addition, 125 x 300 feet, to cost about $450,000.

CHICAGO.—The Steel Tank Products Corp., 10 West Illinois street, capitalized at $30,000, has been chartered by Edmund N. Sinnott, Martin J. Isaacs and James D. Woley.

CHICAGO.—L. G. Hallberg & Co., architects, 116 South Michigan avenue, will receive bids soon on a 2-story plant, 75 x 125 feet, to cost $130,000, for the Republic Flow Meters Co., 565 West Washington street.

DECATUR, ILL.—The Decatur Construction Material Co. has been incorporated with $15,000 capital by A. B. Alexander, Forest File and Dan Dinneen.

EAST ST. LOUIS, ILL.—The East St. Louis Castings Co., 619 North Seventy-fifth street, capitalized at $40,000, has been chartered by Ralph M. Hill, John W. Eschenbrenner and Frank J. Kurrus.

ANDERSON, IND.—The Union Traction Co. will expend $100,000 on its central power plant, installing boilers and overhauling turbine electric generators.

COLUMBUS, IND.—The Shelby Mfg. Co., the Alexander Spreader Works and the Continental Motor Shop Equipment Mfg. Co., Knightstown, Ind., have been consolidated under the name of the Shelby & Staley Corp., with $100,000 capital.

ELKHART, IND.—The Huffman Bros. Motor Co. has broken ground for a $200,000 manufacturing and assembling plant.

FRANKFORT, IND.—The Stewart Wire Wheel Co., capitalized at $500,000, has been chartered to manufacture automobile wheels by John A. Johnson, Albert E. Betts and Charles W. Pence.

FT. WAYNE, IND.—Contracts have been awarded for an addition to the plant of the Wayne Oil Tank & Pump Works, to be 135 x 373 feet.

FT. WAYNE, IND.—The Visible Automatic Pump Co. has been incorporated with $100,000 capital by Augustus Bowser, August E. C. Becker and Guy R. Brochin.

INDIANAPOLIS.—The Robert H. Hassler Co., automobile parts, has started on an addition, 100 x 120 feet.

AKRON, O.—The Williams Foundry & Machine Co. recently awarded a contract for a machine shop, 3-stories, 60 x 145 feet, to cost $100,000.

AKRON, O.—The Summit Welding, Garage & Machine Shop has had plans completed and will take bids soon, for a machine shop, 1-story, 50 x 170 feet, to cost $30,000.

CANTON, O.—The United Electric Co. is reported planning a plant addition.

CANTON, O.—The Homer Engineering Co. plans to establish a machine shop. C. V. Homer is president.

CINCINNATI.—Estimates are being received for a 2-story addition, 70 x 100 feet, to the plant of the Corcoran-Victor Co., automobile lamp manufacturer.

CINCINNATI.—The Sayers & Scoville Co., automobile manufacturer, has plans for a plant.

CINCINNATI.—Work on the plant of the Acme Machine Tool Co. is well under way.

CINCINNATI.—The Standard Railway Supply Co. has purchased a building adjoining to be used to house the company's case hardening department.

CLEVELAND.—The Russ Mfg. Co., 5511 Walworth avenue, plans a plant addition to cost $96,000.

CLEVELAND.—The Metal Plating Co., 7019 Quincy avenue, has a permit to erect a building, 1-story, 34 x 90 feet.

CLEVELAND.—The Metals Welding Co. has been incorporated with $200,000 capital by John Rice and others.

CLEVELAND.—The National Bronze Foundry Co., East Seventy-ninth street, contemplates the erection of a small addition, 35 x 60 feet.

CLEVELAND.—The Star Products & Machine Co. recently was incorporated with $20,000 capital, by Walter Urban and others.

CLEVELAND.—The Saw & Knife Specialty Co. recently was incorporated with $5000 capital, by W. E. Myers and others.

CLEVELAND.—The Great Lakes Copper Co., Trumbull avenue near Broadway, is taking bids for a plant, to cost $50,000.

CLEVELAND.—The Brown Body Corp. is having plans prepared for a plant to cost $500,000 and be 200 x 1000 feet.

CLEVELAND.—The Colburn Machine Tool Co., Franklin, Pa., has awarded a contract for a plant here, 2-stories, 44 x 78 feet, to cost $200,000.

CLEVELAND.—The Piston Ring Castings Co. has been incorporated with $25,000 capital, by Charles I. Russo, William R. Miller and others.

CLEVELAND.—The Cleveland Twist Drill Co. contemplates a forge shop, 1-story, 67 x 113 feet, to cost $12,000.

An agency is desired by a party in France for the sale of steel plates and cement. Opportunity No. 30482.

A trading company in New Zealand desires to purchase and secure an agency for the sale of electric tramway rails. Opportunity No. 30485.

A party in France wishes to secure the representation from exporters of motor agricultural machinery of all kinds. Opportunity No. 30486.

Purchase of a machine for labeling bottles, etc., is desired by a firm in France. Opportunity No. 30487.

The owner of a flour mill in Italy wishes catalogs of automatic grain scales, as well as catalogs of all kinds of machinery used in building work and lock construction, such as concrete mixers, pumping machinery and dredging machinery. Opportunity No. 30511.

An American firm with offices in principal cities of Europe desires to secure agencies for the sale of hardware, enamelware and china ware. Opportunity No. 30512.

A company in France wishes to purchase well-drilling and boring apparatus, sanitary supplies, bath tubs, etc., and central heating systems. Correspondence should be in French. Opportunity No. 30513.

An agency is desired by a party in Roumania for the sale of agricultural machinery, tractors, etc. Opportunity No. 30514.

The purchase of raw materials for cotton and paper mills, metal products, machinery and accessories, is desired by a party in Italy. Opportunity No. 30515.

An agency is desired by a party in France for the sale of automobiles, agricultural implements, etc. Opportunity No. 30538.

An artificial limb factory in Greece is in need of machinery. Correspondence should be in French. Opportunity No. 30540.

A manufacturer in France desires to purchase machines for carding wool and machine parts known as "mule-jenny," as well as buckles for clothing and harness. Correspondence should be in French. Opportunity No. 30542.

A firm in Greece desires to secure an exclusive agency for the sale of sewing machines. Opportunity No. 30545.

A traveling salesman in France desires to secure an agency for the sale of tools and household articles in tin or enamel. Correspondence should be in French or Spanish. Opportunity No. 30547.

A firm in Russia desires to establish connections with American firms for the purchase of electrical machinery and supplies, telephone and telegraph supplies, metal and woodworking machinery, agricultural implements and tanning and textile machinery. Opportunity No. 50520.

An agency is desired by a firm in France for the sale of accessories for steam engines, joints and packings, and asbestos for industrial purposes. Correspondence should be in French. Opportunity No. 30521.

A county engineer of public works in Greece desires to purchase stone crushing machines for road repairs; a petroleum and gasoline engine; well boring machinery; pumps and fittings. Blasting machinery, operated by pneumatic or other power, necessary fittings, etc. Correspondence should be in French. Opportunity No. 30524.

The manager of a plantation in Spain desires to secure machinery and equipment for decorticating and cleaning fiber. Opportunity No. 30525.

A merchant in Italy desires to be placed in communication with firms for the sale of metals in general, but especially pig and manufactured copper, and electrical instruments. Opportunity No. 30526.

Agencies are desired by a firm in Australia for the sale of cylinder latches and other lines of locks, as well as pressed hollow ware, aluminum, household articles, stoves, lawn mowers, etc. Opportunity No. 30529.

The representative of a commercial body in Persia is in this country and wishes to purchase and make agency arrangements for automobiles, agricultural implements, telephone equipment, etc. Opportunity No. 30530.

A firm in Denmark desires to secure agencies for the sale of machinery, agricultural implements, tools, metal products, etc. Opportunity No. 30531.

A commercial agent with a warehouse in France desires to secure an agency for the sale of household articles, hardware, eletric lighting apparatus, metallurgical supplies. Correspondence should be in French. Opportunity No. 30533.

A company in China desires to purchase machinery and parts of machinery, rice mills, drills, air pumps, bellows and forges, crank shafts, emery wheels, crucibles for melting brass, chain blocks, air gages, belting, engines for motor boats, dynamos, magnetos, motors, nonfriction metals, pig iron and tools. The dynamos and magnetos are needed for immediate use. Opportunity No. 30588.

The representative of a firm in the Canary Islands is in this country and desires to secure an agency for the sale of various articles, including hardware, chemicals, tools, etc. Opportunity No. 30550.

A commercial agent in Cuba desires to represent in San Domingo, Porto Rico, the Dutch West Indies and Cuba, manufacturers of hardware, etc. Opportunity No. 30551.

The representative of a firm in Spain, at present in this country, wishes to secure an agency for the sale of electric machinery, central generating stations, small electric material, pumps, turbines, internal combustion motors and lamps. Opportunity No. 30552.

An agency is desired by a party in Italy for the sale of agricultural and general machinery, tools, metals, elctrical supplies, etc. Opportunity No. 30556.

An instructor in a commercial school in Switzerland desires to secure an agency for the sale of typewriting, adding machines, etc. Opportunity No. 30557.

A commission agent in Switzerland desires to secure an agency for the sale of scissors, knives, silver-plated ware, razors, spiral drills, tools, and household articles. Correspondence should be in French or German. Opportunity No. 30568.

New Trade Publications

OIL STORAGE TANKS.—A small leaflet is being circulated by the S. F. Bowser & Co., Inc., Ft. Wayne, Ind., in which oil storage tanks are described and illustrated. These tanks, although of varying capacity, may be placed in batteries, as all are of uniform height.

STEEL TREATING.—A 25-page booklet is being circulated by the Colonial Steel Co., Pittsburgh, in which the treatment of tool steel for various tools and machines, is given. Directions are given for hardening, forging, drawing the temper, grinding, cooling with air blast, furnace control, pack heating, heating, operation of furnaces, etc. The booklet also contains a list of tools and the grades of steel best adapted for their use.

OIL STORAGE.—An 8-page illustrated booklet is being distributed by S. F. Bowser & Co., Inc., Ft. Wayne, Ind., in which lubricating oil storage equipment is described. The equipment, consists of a battery of tanks, especially designed to fill the requirements of manufacturers, railroad oil houses, shops, power plants, etc. Each tank is equipped with a self-measuring pump and other accessories include barrel cradle, barrel track and a chain hoist.

CHIMNEYS.—The Webber Chimney Co., Chicago, is circulating a 56-page booklet in which it describes and illustrates reinforced concrete chimneys. The book is well illustrated, showing chimneys erected by the company including one said to be the highest in the world. It was erected for the Saganoseki copper smelter, Saganoseki, Japan. It is 570 feet high, 26 feet and three inches in diameter at the top, 42 feet and eight inches diameter at the base, and the first section of the chimney, which is 50 feet high, contains as much concrete as is required in the shaft and foundation of an ordinary chimney 150 feet high. Kent's table of chimney sizes for steam boilers is reproduced in the booklet.

MOTORS AND GENERATORS.—A new line of direct current motors and generators is described in bulletin 1106, just issued by the Allis-Chalmers Mfg. Co., Milwaukee. The machines, which are said to embody many details which contribute to accessibility, reliability and safety, range in size from ½ to 50 horsepower for motors and from ½ to 40 kilowatts for the generators. Cast steel yokes are used in machines of the higher ratings while the smaller machines have riveted frames. All machines have ring-oiling, dust proof bearings and the windings are treated to resist oil and moisture. The armature core has the laminations riveted together, permitting the removal of the shaft without dismantling the core or commutator. The adjustable speed motors, intended particularly for machine tool and similar applications, are provided for 2:1, 3:1 or 4:1 speed range.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, September 25, 1919 No. 13

American Workmen Foil Strike

Foreign Labor Deserts Plants at Agitators' Call But Loyal Employes Stand Firm—Mills Hold Upper Hand at Pittsburgh—95 Per Cent of Strikers Are Aliens—Many Are Intimidated

THE most un-American strike in the history of the country has been frustrated by the loyalty of the American workmen of the iron and steel industry. The nationwide walkout made possible by the stampeding of the foreign workmen, which it was threatened by the radical agitators would paralyze the industry, has failed at the vital points and the outlook is that it has passed the crest. It is estimated that 95 per cent of the strikers have been recruited from the ranks of foreign, common labor. The American employes as a rule, not only refused to join in the strike but have manifested a willingness to return to work the moment the opportunity presents itself. While many plants have been forced to close, this has been due in numerous cases to the crippling of certain essential departments and to the involuntary or coerced absence of nonstriking workmen, rather than to the strength of the strikers themselves. The active number of bona fide strikers has been placed at 20 per cent of the total forces now idle. Steel manufacturers have taken a calm view of the situation, awaiting the opportunity to properly appraise the extent of the offensive movement against them. It is manifest, however, that there is no disposition to adopt aggressive measures to reopen plants now idle.

Pittsburgh Runs Well

The Pittsburgh district with its predominating productive capacity has been the least affected of all the leading steel centers. Conditions there have shown progressive improvement since Monday and some of the foreign workmen who went out at the first call, have reported for work. This has enabled the restoring to production of some of the blast furnaces which had been banked. The principal plants of the Carnegie Steel Co. are running well and it is estimated 75 per cent of the capacity of the company is active. The Jones & Laughlin Steel Co., the largest independent in the Pittsburgh district, has maintained virtually full operations since the strike. In the Birmingham district, the walkout has failed signally while in the East operations in general have been interfered with but slightly. The greatest points of disaffection have been in the Youngstown, Chicago, Cleveland and Buffalo districts, where production is virtually at a standstill. In all centers, blast furnace plants because of the large percentage of common and foreign labor employed have offered a prominent target for attack.

Steel Output Curtailed

In some lines, a continuation of present conditions will bring about a sharp curtailment of finished steel production with its attendant stifling effect upon diversified industry; in others the results promise to be slight. Of those products where the recent demand has been heaviest, sheet and tin plate output is being well maintained both in the Steel corporation and the independent mills. In many of the latter, annual union agreements negotiated some months ago, are effective though in several plants the men have ignored their contracts. Production of tubular goods has been cut considerably though the two largest plants in the country are running virtually full. Apart from Cleveland, the capacity in wire products is well engaged. The most pronounced effect of the strike on the line it now has developed, probably will be in the heavier products including bars, structural shapes, plates and rails. The market on most of these materials recently has been the most contracted of all the mill list.

Pig Iron Held Up

Numerous merchant blast furnaces have been banked though the situation in this respect is considerably more favorable than with respect to furnaces joined with steel works operations. Offsetting this restriction of iron supply, moreover, is the fact that the demand has been sharply reduced by the crippled condition of various steel plants at the present time. Already this has brought requests for the suspension of shipments to the furnaces. In the East, the American Bridge Co., which has been drawing its iron from the Pittsburgh district has opened negotiations for 25,000 to 30,000 tons of basic with nearby furnaces.

An Un-American Strike

"ALL Americans at work, all foreigners out." This statement by an official of a large steel company describing the strike situation and echoed in substance in many quarters since Monday, points to a general condition that well may challenge deep public consideration. Its significance cannot be escaped. It is the foreign element deceived or cajoled by unscrupulous agitators or wilfully vicious in its own designs that has appeared as the most conspicuous factor in the present strike and its train of consequences.

The radical agitators who have engineered this strike with a so-called union, embracing all ranks of labor admittedly have concentrated their main efforts upon recruiting the foreign workers. They have calculated by preying upon the credulity, the prejudices and the limited knowledge of basic conditions of these men that because of the large numbers represented, there could be welded together a formidable machine with which to force the manufacturers to do their bidding. Their professions of sympathetic interest in the wage rates and conditions of employment for these workmen have meant little or nothing. There is only one question involved in this strike and that is the attempt of unionism and radical unionism in its worst form to dictate to the steel industry the conditions under which it shall conduct its affairs. All other claims and protestations are pure hypocrisy or fiction, or have been set forth merely for public consumption.

As the situation has developed, the foreign workmen, necessarily the most ignorant and the lowest class of mill labor, stand in the position of attempting to dictate the form of management of American industry. It is the foreign class exploited by the worst elements of organized labor that has deprived thousands of American workmen of the peaceful right to work at their jobs, this week, is holding back American industry from promised prosperity and is helping materially to block the longed for relief to the American public from the present intolerable conditions of living cost.

And the majority of these foreign workmen have no clear or definite idea as to why they are striking. Actual contact with them in the Youngstown district and elsewhere this week proves this fact. They are striking not because they have real or fancied grievances against their employers but because they have been told to do so by the union and they are obeying. the summons.

There is nothing in this strike to mark it as American. In fact, it is essentially un-American in its organization, its designs and its methods. It represents a dangerous thrust against established American institutions. The questions it involves reach beyond the plane of industry into the realm of sound government and orderly society. The steel industry in vigorously combatting this menace of the clamorous and vicious minority is upholding the banner of true Americanism. It should have and will have the wholesouled support of all the reasonable and best elements of American life which must make its eventual victory unquestioned.

Playing Fair with the Public

IN ALL the agitation over the high cost of living the steel and iron industry stands out alone as the one and only branch of business that came to the front when the opportunity offered, cut its prices without cutting wages and has held to the program ever since. Whether the Redfield-Peek plan of interference with the natural laws of supply and demand was wise or ill-advised, a moot point, the steel industry did its bit in the effort to break the vicious circle of advancing costs and advancing wages and did it voluntarily.

Unaided by support from other industries the effort of the industrial board has been futile, but the industry has not reneged, and through the weeks and months following the fiasco prices have been held

at the level then set, with exceptions so slight as to be negligible.

Even when some elements in the trade have been forced to raise prices because costs have mounted, a strong control has been exercised in a way to leave quotations unchanged where necessary supplies could be contracted for without paying the higher figures. Without this strong hold on the lower quotation, a steadying hand that has resisted all blandishments offering a higher level, the market might have run away and surpassed the highest figures of war times.

Radicalism Must Be Eliminated

SENSIBLE suggestions for the avoidance of strikes and lockouts are carried in the proposal of Stephen C. Mason, president of the National Association of Manufacturers for which consideration is asked at the industrial conference to be held in Washington on Oct. 6. A clear conception of the necessity of capital and labor cooperating in a broad way is reflected in the interesting suggestions made. The plan appears easily workable if it were possible to rid the industrial world of agitators, who seek anything but a fair adjustment of differences tending to prevent strikes and lockouts.

It is proposed by Mr. Mason that organized labor and organized industry enter into a gentlemen's agreement to bring to an end the disputes now engaging the attention of the entire country. In short, Mr. Mason is urging that there be no interruption to production and it is his idea that this desirable state of affairs be continued until the President declares an end to the period of industrial readjustment.

The plan of Mr. Mason provides that the President shall appoint a joint committee representing organized industry and organized labor to draw up an agreement, perhaps not unlike that in effect during the war made with the war labor board and to have congress enact legislation stating that such an agreement is made in the interest of the public. Disputes would be settled by an industrial arbitration board.

The forthcoming industrial conference may well give serious attention to the proposal of Mr. Mason as an aid to the solution of the industrial turmoil. Both labor and capital can well afford to declare a truce and submit their differences to a fair board of arbitration. Such a course would probably avoid a vast waste, greatly help in reducing the cost of living, and prevent untold suffering.

It must be said that industry as a general thing has manifested a willingness to deal fairly with its employes and to go as far as it may safely go toward smoothing out troubles with labor. But organized labor, particularly its most radical element, refuses to listen to reason. It wants "direct action."

This element should be summarily delt with through any proper course that is necessary and the better wing of organized labor should join with industry in effecting a truce, under which opportunity may be given for the adjustment of differences. Organized labor must know that it is not going to be permitted to ride roughshod over the rights of employers. In the case of the steel producers organized labor has just as many rights as have nonunion men, no more, and no less, and that is the way it should be. To do otherwise would be unfair to the larger men who choose not to become associated with organized labor.

A War Bubble That Burst

SOME months ago Japanese export and import merchants appeared in the American market as heavy buyers of various kinds of raw materials, including copper, lead, zinc, chemicals, certain ferroalloys, steel products and other commodities. It is estimated that upwards of 20,000 tons of copper, 10,000 tons of zinc and 10,000 tons of lead were sold on this movement. This business was rather surprising to New York sellers at the time. It was difficult to understand why Japan, a producer of copper, should buy the red metal. A producer of zinc herself, why should she buy zinc? Why should she buy lead in the United States with Australian supplies much more convenient geographically? Some few jingoists in this country and England, too, saw war preparations in this buying, especially as the buying included ferrovanadium, used in large gun linings, and certain chemicals used in warlike as well as peaceful purposes.

But recent weeks have seen some heavy resales of copper by Japanese merchants, who reaped a speculative profit of several cents a pounds. Only a part of the copper bought was resold, but the very reselling of it was indicative of the absence of any ulterior motive. Explanation of the Japanese buying is found in the fact that Japan has advanced industrially more than any other country during the war. She has built up a large manufacture of metal products, for which she needs raw materials. Japan likewise has been having its own labor troubles and rising wages. Both copper and zinc production have been largely unprofitable under present economic conditions. It is cheaper to import slab zinc from the United States than zinc ore from Australia for smelting. It is cheaper to buy American electrolytic copper than to work the high cost Nipponese copper properties. Japanese buying can be ascribed to commercial, not to war motives.

Demand for Prompt Iron Grows

Banking of Numerous Furnaces Causes Consumers to Cast About for Supplies — American Bridge Co. Seeks Basic Tonnage in East, Due to Pittsburgh Conditions—1920 Sales in N w England Are Active

Philadelphia, Sept. 23.—Pig iron demand aparently has been stimulated by the fear on the part of some consumers that operations at the blast furnaces may be curtailed by the strike. Numerous consumers having ample storage facilities are inquiring for large tonnages for prompt and nearby delivery and since these tonnages are in excess of the consumers' capacity, the furnaces figure these users desire to protect themselves against eventualities. Among current inquiries are 5000 tons of foundry iron for the Bridgeport Crane Co., 4000 tons for the Whitin Machine Works, Whitinesville, Mass., 3000 for the Draper Co., Hopedale, Mass., and others. Inasmuch as furnaces in most cases have disposed of their output through this year, it is hard to get large tonnages for early shipment. Considerable iron was held the past week for this year at higher prices. In fact eastern Pennsylvania market now may be quoted at $29 furnace for No. 2 plain (1.75 to 2.25 silicon), $32 for No. 2X (2.25 to 2.75 silicon). Makers who had been holding for these figures for some weeks without doing any business, report sales of thousands of tons the past week. Included in the sales was 1000 tons of high manganese for Pennsylvania railroad. A promising inquiry due to strike is from American Bridge Co., for basic which is due to the situation in the Pittsburgh district obstructing shipments to that consumer. It is inquiring as to available tonnage this grade in case it has to purchase for its Pencoyd plant. It is believed this interest may buy 25,000 to 30,000 tons within few days. Otherwise basic is featureless. The only low phosphorus sale reported the past week was 400 tons of copper-bearing. Otherwise the low phosphorus market is featureless and unchanged. Virginian foundry is being sold here for delivery next 30 to 60 days at $30 furnace for No. 2X. Very little Virginia No. 2 plain is available. Considerable Virginia high manganese and high silicon is being sold with usual differentials.

One maker has taken orders for 2600 tons copper-bearing low phosphorus iron so far this month with minimum price of $35, furnace.

Foundry Sales Are Numerous

Boston, Sept. 22.—With 1920 iron offered at the same level with this year's delivery, New England foundries have been rushing into the market. During the past week, approximately 14,000 tons of foundry iron for 1920 delivery was placed through Boston dealers. This was mostly No. 2X (2.25 to 2.75 silicon), although several lots were for the higher silicon grade. One order of 600 tons of 3.75 and above, silicon, was sold to a special machine manufacturer in eastern Massachusetts for first quarter delivery at $33 Buffalo. The largest buyers have been the textile machine plants, and sales to this class of consumers have amounted to approximately 10,000 tons. The Draper Corp. has not yet purchased, although it is understood an order in the neighborhood of 15,000 tons is contemplated, and may be placed this week. The orders that were placed, ranged from small tonnages to 4000 tons and for the bulk of the 1920 business the price was $29 Buffalo for No. 2X. Sales from other districts have been reported at an advance of more than $1 above this, delivered to consumer. Alabama furnaces are quoting 1920 iron at $30 for No. 2, 1.75 to 2.25 silicon, $31.20 for 2.25 to 2.75 silicon, and $32.40 for 2.75 and up. One thousand tons of malleable was sold to a Rhode Island consumer at $32.90 delivered. The Chapman Valve Co., Springfield, Mass., bought 500 tons of No. 2X at under $31 delivered. The steel situation has as yet had little effect on the foundry iron market. One western Pennsylvania furnace wired its refusal to accept orders for foundry iron which it has received. Many jobbing foundries have been in the market for immediate or last quarter requirements. Several orders were for Alabama iron, of which 250 tons were sold to a western Massachusetts consumer at $36.50 delivered for No. 2. Massachusetts stove plate manufacturers bought 1000 tons, machine tool plants placed several orders and jobbing foundries in Connecticut and Massachusetts were active in the trading. A large Rhode Island consumer has placed orders for this year which will cover the normal requirements for the entire year of 1920. Total sales of the week through New England representatives is estimated at 20,000 tons.

Prompt Iron Scarce

New York, Sept. 22.—Pig iron for spot and nearby shipment now is harder to obtain in the East. This is due not only to the large amount of business on furnace books for this year, but also to the fact that producers who recently booked considerable business with the intention of going into blast are blowing in at a later date than they originally expected. Consequently, their output must be applied to contracts and very little is available for disposition at this time. The principal inquiry in the market in this district at this time is one from the Crane Co., Bridgeport,

Conn., for more than 5000 tons, involving 2500 tons of 2.25 to 2.75, and 2500 tons of 2.75 to 3.25 silicon foundry, and 350 tons of malleable, all for prompt shipment. Owing to the scarcity of prompt iron, not as many furnaces as usual are able to quote on this inquiry. Sales during the past week have been restricted to the usual small number of furnaces, since most makers are out of the market due to their previous bookings. Of the iron sold here during the past week, a fair tonnage was sold by a Virginia maker who now is asking $31, furnace, for 2.25 to 2.75 silicon, and $32 furnace for 2.75 to 3.25 silicon; this interest has a base price of $30 on 1.75 to 2.25 silicon, but there is very little foundry iron with such a low silicon content obtainable in the Virginia market at this time. Several thousand tons of Buffalo and western Pennsylvania iron, foundry and malleable, have been sold in this district during the past week, and at least two eastern Pennsylvania makers have booked fair tonnages. It is estimated that sales made during the past week in this district totaled at least 15,000 tons. There is considerable export inquiry before the trade but due to adverse exchange and other factors, these inquiries are materializing into little business.

Strike Interferes With Business

Pittsburgh, Sept. 23.—Consideration of inquiries for pig iron has given way to more important matter of the strike, which has resulted in the banking of several merchant furnaces. Inquiries for foundry iron recently have been quite numerous. Among them was one for 10,000 tons for last quarter for shipment to the East, reported by a brokerage interest, while the inquiries of the National Transit Co., Oil City, Pa., and the Westinghouse Machine Co., East Pittsburgh, were still uncovered when the strike broke. In addition, at least two good inquiries for foundry iron for delivery over first half of next year were under negotiation. This business is off until the situation clarifies and the producers know where they stand. Little interest lately has been observed in the steelmaking grades, but deliveries against contracts were proceeding at a satisfactory rate. It is too early to tell how the strike is going to affect shipments, but as the furnaces which now are idle are merely banked, producers evidently are figuring upon an early resumption. Merchant furnaces to suspend as a result of the failure of sufficient workmen to report are the Alice furnace of the Valley Mold & Iron Corp., Sharpsville, Pa.; the Sharpsville furnace, Sharpsville, Pa., operated by the Allen S. Davison Co., Pittsburgh; the Claire furnace, West Middlesex, Pa., operated by E. W. Mudge & Co., Pittsburgh; the Mattie furnace of the Struthers Furnace Co., Struthers, O.; and the furnace of the Stewart Iron Co., at Sharon, Pa. The Fannie furnace, West Middlesex, Pa., operated by the M. A. Hanna Co., and the three stacks of the Shenango Furnace Co., at Sharpsville, Pa., have not been affected by the strike. Prices of all grades of iron are nominal at the moment in the lack of important sales upon which to base accurately.

Merchant furnaces to bank as a result of the failure of workmen to report are the Alice furnace of the Valley Mould & Iron Corp., Sharpsville, Pa., the Sharpsville Furnace, Sharpsville, Pa., operated by Allen S. Davison & Co., Pittsburgh, the Claire furnace, West Middlesex, Pa., operated by E. W. Mudge & Co., Pittsburgh, the Anna furnace of the Struthers Furnace Co., Struthers, O., and the furnace of the Stewart Iron Co., at Sharon, Pa. The Mattie furnace of the A. M. Byers Co., Girard, O., occasionally a merchant stack, also has been forced to bank. The Fannie furnace, West Middlesex, Pa., operated by the M. A. Hanna Co., still is blowing and two of the three stacks of the Shenango Furnace Co., Sharpsville, Pa., continue in blast. Prices of all grades of iron are nominal at the moment in the lack of any important sales upon which to base them.

Adopt Waiting Policy

Buffalo, Sept. 23.—Furnaces in this territory are pursuing a waiting policy pending the strike and are showing a considerable degree of caution. Only two of the four Buffalo interests are directly affected by the strike. One of the interests affected sold 3500 tons of foundry iron during the past week but is not quoting this week. The two interests unaffected are not selling iron. One is sold up for 1919 and declines to quote for 1920. The other is not willing to take chances with the present unstable labor situation, although it had contracted for limited tonnages of 1920 iron prior to the strike. This maker reports inquiries for between 5000 and 6000 tons of malleable and foundry iron, but is not now quoting.

Demand at Chicago Brisk

Chicago, Sept. 23.—As a result of the banking of merchant stacks, deliveries of pig iron have been interrupted and demand for spot iron is brisk. Sellers having cars in transit are disposing of iron promptly, with a large number of inquiries unsatisfied. Producers are selling only subject to the strike, and orders are not being sought. One broker on Monday sold all the iron he had in transit from the south and other points. Current inquiry includes 500 tons of malleable, 200 tons of No. 2 foundry, and 1000 tons for a Michigan buyer for the first quarter. There are many inquiries for carloads. The coke shortage is the worst menace to the foundries. The supply of Tennessee silveries is nearly exhausted. Small sales are being made. Ohio silveries are also being sold here. Five hundred tons are going to southern Wisconsin. Agricultural manufacturers are inquiring in the open market for small tonnages of basic and bessemer. The strike is limiting most inquiry to prompt shipments, although sellers are willing to book 1920 iron at the present price.

Shipments Are Held Up

Cleveland, Sept. 23.—Orders for holding up basic pig iron and other raw materials have been received by producers from various steelmakers in this and surrounding districts whose operations have been affected by the strike. In one or two cases foundries which have been working on orders for steel plants have asked for suspension of shipments because of the interruption of deliveries on this work. These requests for the holding back of deliveries of iron, however, have been the exception rather than the rule. On the other hand, a good many consumers continue to exert efforts to cover themselves on their requirements after Jan. 1, and some sizable orders have been closed within the past day or two, including one of 6000 tons of foundry iron placed yesterday. Another order of 2000 tons also was closed. These orders were accepted by the makers on the basis of $26.75, furnace, for 1.75 to 2.25 silicon. Other sales of the week have been scattered and light. Furnace operations in this district have been only partially affected by this strike. The two furnaces of the Cleveland Furnace Co. are active but the four stacks of the McKinney Steel Co. are banked. At Toledo and Erie, production is going forward as usual.

Some Contracting Done

Cincinnati, Sept. 22.—The sole topic discussed here is the probable effect of the steel strike on the iron market. The decline in the inquiry for foundry iron is noticeable. There is no demand for either basic or bessemer. Shipments of southern foundry iron are going forward as fast as the furnaces can obtain cars. Some last quarter contracting was done last week, but it is understood that a large part of the iron will be shipped during the first quarter. Southern furnaces are running short of iron with a silicon content of 1.75 to 2.25 per cent, but some of them can still take on a fair tonnage of iron ranging from 2.75 to 3.25 silicon. No southern Ohio furnaces have been affected in any way by the strike, nor is any trouble anticipated. Delayed shipments of coke may cut down producion in the Ironton district unless there is an early improvement. Southern foundry iron (1.75 to 2.25 silicon) is around $28 for this year's shipment, and northern foundry ranges from $27.75 to $28, Ironton, for the same delivery. No quotations are out for next year.

St. Louis Market Quiet But Steady

St. Louis, Sept. 20.—Aside from the sale of a few small scattered tonnages for prompt delivery, principally to the foundries, the pig iron market here is quiet. Consumers are disposed to await labor devolpments before formulating new plans. A brisk inquiry for 1920 iron developed, but was retarded by the strike situation. Consumption in this district continues on a large scale, all foundries being run at full capacity. Strenuous efforts are being put forth by these interests to keep up their supplies of raw material, and considerable trouble is being experienced because of the difficulty in securing the desired grades of iron, and the car shortage. There are many complaints relative to deliveries. Prices hold steady, but with a strong undertone. Southern furnaces are asking $28, Birmingham, for No. 2 (1.75 to 2.25 silicon), for

shipment over the balance of the year. Selling agencies here are earnestly hoping that there will be no advance in price and are advising their principals to hold the market steady.

Southern Market Firm

Birmingham, Ala., Sept. 23.—Pig iron sales are still being made, but cautiously, in southern territory. The market is firm, despite the labor situation. Coal and ore miners are not included among the strikers, and raw material is being kept moving to the furnaces. Labor at the furnaces in this district is colored and the negroes are remaining at their posts. The railroad car shortage is still felt and stocks of iron show but little reduction. It is currently reported that sales have been made for 1920 delivery on a basis of $29 for No. 2 foundry (1.75 to 2.25 silicon).

Uncertain Supply

In Semifinished Material Due to Strike —Finishing Mills Doing Well

Pittsburgh, Sept. 23.—Although the strike of the steel plant laborers has not been more general than was expected by manufacturers it has caused the temporary suspension of some of the independent producers of sheet bars and billets, and a dislocation of production and shipments is probable, rendering uncertain the supplies to the finishing mills. Comparatively little sheet or tin mill capacity is affected by the strike and it is noted that the Carnegie Steel Co., the most important commercial producer of sheet bars and billets, taking in all of its plants throughout the country, is operating at 75 per cent of capacity. At Homestead, Duquesne and Braddock, Pa., the plants of this company were practically unaffected by labor troubles. Youngstown, O., producers, however, have been affected. Wire rods appear to be in ample supply for prompt shipment, and on export business it is hinted that the full premium of $5 per ton over domestic prices is not being insisted upon.

Business is Unattractive

Philadelphia, Sept. 23.—The semifinished market, which for months has been dull here, continues featureless, no orders of size being booked. However, this is not disappointing to the mills as they say the semifinished business is not attractive at present prices. None of western makers are in a position to take any of this business by reason of the strike.

Export Billets Held Up

Chicago, Sept. 23.—With heavy inquiry for semifinished steel in the form of billets and sheet bars for export to England, the leading independent is equally anxious to book 50,000 tons or more of this material to fill in on some new equipment. The foreign exchange situation, however, is such that neither buyer nor seller can absorb the loss brought about by the low price of sterling and it has been impossible up to this time to arrange for the financing of this tonnage.

Coke Shipments Suspend

Banking of Furnaces Brings Flood of Orders to Delay Deliveries — New Demands are Light

Pittsburgh, Sept. 23.—Banking of a number of merchant and steel plant blast furnaces as a result of the strike, has been accompanied by a flood of orders to producers of beehive furnace coke to hold up shipments. New demands, meanwhile, have tapered off to negligible proportions, and the basis on which sales might be made is a matter of conjecture. While oven operators lately have been naming $4.75, ovens, on standard 48-hour fuel, and in some instances have been able to make sales at that figure, the price has in only a few cases been exceeded, and it is doubtful if a bid of $4.50 would have been refused. The market reflects not only the lighter demand, but since the coke market recently advanced partly as a result of a strong coal market, it naturally has been affected to some extent by a weaker coal market, produced by restrictions placed on eastern shipments of coal. Permits now are essential for shipments of coal east, and only by producing evidence that the shipments were intended for export have shippers obtained permits, issued through the Tidewater Exchange. Until the coke producers are able to adjust production to consumptive requirements, it is probable that the market will rule in the buyers' favor. No reliable quotations can be given at present in the lack of business on which to base them. Quotations purely are nominal. Foundries generally are unaffected by the strike and a fairly steady demand still exists for standard 72-hour fuel, with the market well established at a minimum of $6, ovens, and choice brands doing $6.25 to $6.50. The production of coke for the week ended Sept. 13, is estimated by *The Connellsville Courier* to have been 259,900 tons, against 263,742 tons in the previous week.

Germans Take Coke Trade

New York, Sept. 22.—Italian orders, which were beginning to be conspicuous in the demand for American coke for export, have fallen away during the past few weeks, because of the ability of the consumers to obtain fuel in Germany at a considerably lower price and with a much lower freight rate. What the price was is not being divulged, but it is known that considerable tonnage of German coke already has been sold. Domestic coke business in the East comprises a fair amount of spot buying and also some for shipment over the remainder of the year.

Coke Moving Slowly

Cincinnati, Sept. 22.—Considerable complaint is made relative to slow shipments of both furnace and foundry coke. Supplies to some of the southern Ohio furnaces are low and it is now reported that by-product coke is moving very slowly. Some of the delays may be attributed to the shortage of cars, which seems to be increasing. It is almost impossible to get any coke from the Wise County and New River districts. Pocahontas foundry fuel also is unobtainable Connellsville furnace coke is around $5 and foundry grade from $6 to $6.50 New River foundry coke is quoted at $9 to $9.50 and Wise County at $8, ovens.

Car Shortage Still Felt

St. Louis, Sept. 20.—Coke dealers and consumers continue to complain of the car shortage. Eastern producers report they have ample stocks to ship on contracts and orders, but cannot obtain cars. Some borrowing is reported, and the leading by-product interest has been able to furnish small tonnages. Several foundries which have taken on new business for prompt delivery are much worried relative to their coke supplies. Generally, the market has undergone no change, the demand being good. Little is heard in regard to contracts for next year. Most producers not caring to book that far ahead. A fair tonnage of foundry coke was placed during the week for a local foundry.

Strong Demand in South

Birmingham, Ala., Sept. 23.—Demand for coke continues strong. Inquiries are coming in for heavy tonnages of foundry grades. Two or three companies are practically out of the market so far as coke for delivery this year is concerned. Unless the union miners become involved in the iron and steel strike there will be no interference with the coke market in this district.

More Ore Sold

Orders Totaling 130,000 Tons Largest Placed in Month

Cleveland, Sept. 22.—Attention in the ore market is centered almost entirely on the strike in the iron and steel industry and its possible consequences in the market. Despite the strike, sales or ore during the past week were the largest reported for any one week in more than a month. One interested received orders for more than 100,000 tons, 75,000 of which were from a connected interest, while another company has received orders for several small tonnages totaling 30,000 tons. A large company with extensive furnace interests has closed its books for the season, and is now devoting its efforts entirely to getting the tonnage down from the upper lakes. Another company has placed all its tonnage of low phosphorus ores. Companies still having ore to sell are optimistic in regard to the future; they still expect some demand to come out. The strike situation as it pertains to the ore industry is reviewed more fully in connection with the strike developments printed elsewhere in this issue.

Scrap Trade is Curtailed

Strike Condition Causes Holding Up of Shipments—Prices Generally Steady, Though Weaker at Chicago

FOR COMPLETE SCRAP PRICES SEE PAGE 870

Chicago, Sept. 23.—With the inauguration of strikes in steel mills, buying and shipment of iron and steel scrap is almost stopped, dealers having received orders from some customers not to ship any more material until further notice, which probably means until the situation has resolved itself sufficiently to indicate what scale of operation can be maintained. Most grades are somewhat weaker with declines of about 50 cents per ton, but cast scrap is strong and moving well. A sale of 2000 tons at close to the prevailing quotation was made recently with numerous smaller sales bringing the aggregate fairly high. Railroad offerings are unusually light, the Chicago & Alton closing a small list and the Chicago, Burlington & Quincy offering a list of only 500 tons.

Foundry Requests Increase

Boston, Sept. 22.—The affect of the steel situation in the scrap market here has been to increase greatly the spread between the grades used by the steelmakers and those used by the foundries. The demand from the steel plants has fallen off sharply simultaneous with an increased demand from foundries. The Cambria Steel Co. has stopped shipment on all scrap originating in this territory, and other steel concerns are doing the same. Heavy melting steel for the first time in several months is accumulating at plants. Steel rails have dropped $1 and heavy melting steel has fallen off nearly as much. It is interesting to note in this connection, that one of the New England steel plants has been buying a fair amount of heavy melting steel during the last 10 days, and today placed an order for several hundred tons. No. 1 machinery has jumped to $29, consumers' price, and sales above this figure have been reported. The local ordnance department is offering further lots of scrap steel.

Dull Market Prices Steady

New York, Sept. 22.—Although trading in the local scrap market is dull, prices continue to hold nominally unchanged. Heavy melting steel is being quoted at $15 to $15.50, although there is not enough business to test the market. From all early reports the mills in the Lehigh valley are able to continue operations, unmolested by strikes, and this has added a note of confidence to sentiment. It is believed generally, however, that buying for the time being at least will be only on a hand-to-mouth basis, pending a decisive development in the steel labor situation. A fair demand is in evidence for cast scrap, and according to dealers this is virtually the only material moving.

Only One Mill Buys

Philadelphia, Sept. 23.—Strike situation has flattened out the scrap market. Only one mill has shown an inclination to buy heavy melting steel during past week but dealers are not interested. In fact, mills generally are unwilling to buy because in case of a tie up they would have great difficulty in receiving shipments and dealers are unwilling to sell since they cannot see any attraction in an order unless there is some assurance they will be able to ship. Sales of other grades are small. Included in the business of the past week was a good sized lot of borings and turnings for chemical use at price which establishes the market on this grade at $17 to $18.

Market is Unsettled

Pittsburgh, Sept. 23.—Business in scrap iron and steel here which for several weeks has been on an extremely limited scale, has come to a halt. Dealers report quite a number of requests for suspensions of shipments on contracts, but quite as many consumers still are taking in shipments coming to them. Prices merely are nominal for under the circumstances consumers are not interested and dealers realize the futility to make sales at the moment.

Scrap Market Not Yet Affected

Buffalo, Sept. 23.—The strike in this district has not yet had any noticeable effect on the scrap market. There is still a strong demand for most grades of scrap, and an exceptionally strong demand for cast iron borings. It is believed that it will be only a matter of a few days, should the strike continue, that the market will begin to feel the effects of a lessening demand. Although only one group of mills have been crippled, it is believed that makers will not want to pile up an excess of stocks.

St. Louis Market Irregular

St. Louis, Sept. 22.—Irregularity continues to feature the scrap iron and steel market, while the undertone is bearish, and prices have a downward tendency. Dealers lists show reductions during the week ranging from 50 cents to $2 on virtually all grades. The steel strike situation is the principal factor making for unrest. Consumers show a disposition to hold off, and dealers are not doing much speculating, while offerings are not large. Some of the industries, notably the foundries, are making inquiries, but are not willing to pay what dealers ask. Mills are well supplied with material under contract, but foundries have enjoyed a business far in excess of expectations, and some have been obliged to enter the market. Fair quantities of various grades of scrap still remain in the yards, as a result of the buying during the past few months. The strength of the pig iron market is a source of considerable encouragement to scrap interests. There is a marked scarcity of low grade pig, and consumers are using scrap whenever possible.

Dullness More Pronounced

Cleveland, Sept. 23.—Dullness which has featured the local scrap iron and steel markets the past few weeks has been accentuated by the strike. The leading users of scrap in this district have shut down, and although the prospects of their resuming at an early date are fair, they have fairly large stocks on hand and claim they will be out of the market for some weeks. The largest buyer in this district has been buying shell scrap from the government and has many months' requirements cared for in this manner. Prices, as a natural result of market conditions, are weak and tend downward.

Plate Orders Are Moving

Eastern Mills Book Fair Amount of Tonnage—8000 Tons of Ship Work Pending—Prices Still Show Spread

Philadelphia, Sept. 23.—Offering of plates has been little affected by the strike as eastern output is not much curtailed by the strike. The Lukens Steel Co. whose operations yesterday were handicapped by the crippling of the gas producer department has succeeded in replacing strikers and now is running on same schedule as last week. The Midvale Steel & Ordnance Co. also has made some improvement in this direction at Coatsville. Therefore the plate orders being accepted same as before. Considerable tonnage has been booked lately and one eastern mill by reason largely of export orders is practically closed upon its tonnage for the rest of the year. Among new plate orders is one for 8000 tons of plates and shapes for vessel work in this district which is on the point of being closed. The prevailing eastern price on domestic business is 2.65c Pittsburgh but sevtral orders lately have been taken at less and in some cases at 2.50c. The American Locomotive Co. last week placed a tonnage at latter price.

Demand Still Extremely Light

Pittsburgh, Sept. 23.—While good demands are being made upon the plate mills by the tank makers, almost no demand is coming from car and shipbuilders and the requirements of the former are providing no tax upon mill capacity. Both of the latter appear to have ample supplies of plates and are practically out of the market. Prices still are comparatively soft, with 2.50c, Pittsburgh, the basis of most of the current busi-

ness save in those cases where the inquiry involves only a small tonnage. While the plate card does not call for a quantity differential, a higher price than 2.50c in most cases is merely a quantity differential.

Western Demand Fair

Chicago, Sept. 23.—In view of present producing capacity of plate mills, present demand for this product is relatively light and most mills are able to take on considerable more tonnage than they have booked at present. The leading independent in this district has filled its books on plates and is out of the market for any delivery before the first of the year.

Pipe Output

Interrupted at Some Plants—National Tube is Little Affected

Pittsburgh, Sept. 23.—While the National Tube Co. and the Jones & Laughlin Steel Co. are practically unaffected by the strike, other makers of tubular goods are in a less fortunate position. The valley makers have suspended operations as have also the Wheeling, W. Va., manufacturers. The A. M. Byers Co., makers of wrought iron pipe, operating under an agreement with the Amalgamated Association of Iron, Steel and Tin Workers, has its Pittsburgh works running full, but its Girard, O., skelp works are idle because common labor went out at most of the blast furnaces and the rolling mills left the puddlers idle although they were ready to work. No letup is noted in the demand for lapweld pipe, but with production likely to be thrown out of gear by the disturbance, all inquiries are being turned down.

State Wants Tonnage

New York, Sept. 22.—Bids are being closed this week by the commonwealth of Pennsylvania on about 1500 tons of pipe for use in connection with the soldiers and sailors memorial bridge at Harrisburg, Pa. This is one of the largest tonnages up at the present time, although there appears to be an improvement in municipal demand, which is resulting in more sizable inquiries coming out.

Chicago Buying Slow

Chicago, Sept. 23.—Practically no tonnages of cast iron pipe have been closed in the Chicago district recently, although a number of projects are under consideration. Bids were opened at Detroit Sept. 18 on about 5000 tons on which the award has not yet been decided. Bids will be opened Sept. 29 on 100 tons of 12-inch pipe at Milwaukee and Broadwater, Nebr., will open bids Oct. 7 on 100 tons. One important maker has advanced its quotations on smaller size pipe, asking $59.80 delivered Chicago, on six and eight-inch, $62.80, on four and $69.80 on three-inch.

Oklahoma Buys Much

St. Louis, Sept. 23.—The United States Cast Iron Pipe & Foundry Co. has taken 1872 tons for Enid, Okla., and 850 tons for Ponca City. Inquiry for the south and southwest is unusually strong, and considerable business is expected to follow later.

Shape Demand Continues

Structural Market Fairly Active Despite Strike—Chicago Building Trades Resume Work

Chicago, Sept. 23.—With the strike and lockout of building trades in Chicago settled and workers returning to their duties the first of this week, the already heavy demand for structural material is expected to enlarge considerably. Unless the steel mill strike prevents delivery of this material, large tonnages should be placed within the next few weeks from among projects temporarily held up by the former strike. The leading independent has its structural capacity well sold except for heavy sections which it cannot book at present from lack of roll equipment on its new mill. Specifications are being received already on contracts placed for structural work in Chicago which had been held back by the local situation. The largest tonnage of structural material placed in the west during the past few days involves 810 tons for two armories for the University of Iowa, at Ames and Iowa City. The Times-Picayune building at New Orleans, which required 624 tons of structural steel, has been changed to reinforced concrete. The buildings for Montgomery Ward & Co., at Springfield, Ill., to be used as an engine manufacturing plant, are being redesigned and temporarily are out of the market.

Big Bridge in Prospect

New York, Sept. 22.—Little activity is in evidence in the local structural market. Several sizable tonnages which have been before the trade for some time are still pending, and new inquiries of importance are scarce. A new project of considerable importance, although in the preliminary stages, is a New York Central railroad bridge over the Hudson river, near Albany, N. Y. It is expected that about 15,000 tons will be involved. At the present time there is some controversy between railroad officials and state authorities as to the type of the bridge. Prices are strong, it appearing $90, erected, is the lowest available quotation on the general run of material. So far as can be learned, eastern fabricating shops have as yet been little affected by the strike.

Eastern Mills Get Orders

Philadelphia, Sept. 23.—Shape offerings have not been interfered with in the east by the strike as no eastern shape mills are down. The inability of the western mills to make promises is enlarging somewhat the new business of eastern makers. Due to fears of extension of the strike, consumers are specifying liberally on contracts and want deliveries so as to have some material in reserve. The market is devoid of structural lettings.

Not Crowded with Orders

Pittsburgh, Sept. 23.—The position of the shape mills in the matter of bookings shows little improvement. Few of them have more than a few weeks' business in sight, though fabricating interests are getting some business and report a heavy volume of inquiries. While it cannot be said that structural jobs are bringing materially higher prices, a somewhat firmer tone is apparent and some tendency is observed on the part of investors to speculate, which is ascribed in some quarters to a belief that the latter expect higher prices. A case is cited of a project involving 2500 tons, the erection work on which will hardly get under way until next summer, while the buyer is now seeking an option on the steel.

Report Business Still Good

Cleveland, Sept. 23.—The strike in the iron and steel industry has not as yet affected the market in this district for small tonnages of structural shapes, and the leading fabricators report that business is still good. The inability of small mills to produce material may eventually force some of the fabricators out of the market, but the general opinion among the fabricators, who have sought to appraise the strike situation because of its possible effect on their business, is that there is no cause for alarm. They believe the strike will be short lived, and say their reports indicate that it will be a failure. The Fort Pitt Bridge Works took 420 tons for an extension to the plant of the Erie Tire & Rubber Co., Sandusky, O., and several smaller jobs involving in the aggregate a good tonnage. Another interest received orders for several hundred tons of shapes.

CONTRACTS AWARDED

Extension to plant of Erie Tire & Rubber Co., Sandusky, O., 420 tons; to Fort Pitt Bridge Works.

Building for International Motor Truck Co., Allentown, Pa., 1000 tons, to the Austin Co., Cleveland.

Plant for the Cleveland Rubber Mold Foundry & Machine Co., Cleveland, 275 tons, to J. E. Morris Iron Works.

Two armories for state University of Iowa, 810 tons, to McClintic-Marshall Co.

Times-Picayune building, New Orleans, 624 tons, to reinforced concrete.

Galvanizing building for Hubbard & Co., Chicago, 378 tons, to Union Foundry Works.

Bridge near Lick, Ill., for the United States railroad administration, Chicago & Northwestern railroad, 187 tons, to American Bridge Co.

Alterations and extensions to power house, for Little Rock Railway & Electric Co., Little Rock, Ark., 181 tons, to American Bridge Co.

High school building at Aurora, Minn., 122 tons, to American Bridge Co.

CONTRACTS PENDING

Two highway spans for state of Idaho, 250 tons, inquiry pending.

Factory building for Bridge & Beach Mfg. Co., St. Louis, 800 tons, bids being taken.

Hotel at Detroit, owner withheld, 1400 tons, Fridstein & Co., engineers, taking bids.

Lima hotel, 300 tons; bids being taken.

The Gary Foundry & Machine Co., Gary, Ind., has raised its capital from $15,000 to $100,000.

Urge Shipments of Bars

Consumers Besiege Mills for Quick Shipments—New Business Generally is Being Declined by Makers

Chicago, Sept. 23.—All classes of steel bar consumers have been besieging mills for as prompt delivery as possible, indicating either a heavy consumption in manufacturing operation or desire to put as much stock on their yards as possible before the strike could cut off their supplies or reduce them. New business in soft steel bars is fairly slow, and offers small tonnages at the moment, probably largely the result of the strike situation. The leading independent is completely sold out on soft steel bars for the remainder of this year and has withdrawn from the market for the present.

Quietness, which has prevailed in the bar iron market for some time, continues to be much in evidence and one mill, which has been down the past two weeks, was started Monday with sufficient tonnage to insure operation during the present week. No change in quotations has been made. Demand for hard steel bars rerolled from rails holds up well, with demand coming mostly from manufacturers and comparatively little from reinforced concrete users.

Some Bar Mills Affected

Pittsburgh, Sept. 23.—With the Youngstown district plants of the Carnegie Steel Co. and those of the Republic Iron & Steel and the Youngstown Sheet & Tube companies, Youngstown, O., and the Cambria works of the Midvale Steel & Ordnance Co., Johnstown, Pa., idle as a result of the strike, much steel bar mill capacity is down. Bar mills in this district of the Carnegie Steel Co. are only slightly affected and the Jones & Laughlin Steel Co. is running its bar mill practically full. The operation of the bar iron mills here are unhampered as leading manufacturers are working under an agreement with the Amalgamated Association of Iron, Steel and Tin Workers. Good demand is noted for both steel and iron bars but under the circumstances little business is being done. Strong demand also is noted for concrete reinforcing bars. The Witherow Steel Co., Pittsburgh, has been awarded 2000 tons for a new warehouse in Baltimore.

Accept New Business Carefully

Philadelphia, Sept. 23.—Because of the strike situation, the mills are careful in entering new business, particularly in steel bars in which makers are booked up most heavily. Several mills are out of market entirely on bars while they are accepting specifications on contract they are not giving any assurances whatever as to when they will ship. One mill which now is out of the market sold considerable tonnage last week prior to its withdrawal at its new price of 2.50c, Pittsburgh.

Bolt Shipments Heavy

Chicago, Sept. 23.—Mills producing bolts and nuts are unusually busy with specifications on contracts being filed in heavy tonnage, while new business is being offered in steady volume. Most makers are unable to take on further orders or at least cannot extend their sales beyond the needs of regular customers. In most instances present obligations will cover production practically to the end of the year.

Demand Unevenly Distributed

Pittsburgh, Sept. 23.—Fairly good demand still is reported for cold finished steel and shafting, but it is not especially well distributed in the various sizes and shapes, as automobile and tractor builders still are by far the best buyers. The new card issued as of Aug. 18 is being employed by all makers and all confusion attending its introduction has disappeared.

Stock Demand Grows

New York, Sept. 22.—Local warehouses are in receipt of an increased demand, and this development is accounted for in part by the steel strike. Consumers, fearing that there may be a shortage as a result of possible seriously curtailed mill operations, are said to be buying from the warehouses on a larger scale than at any time this year. This buying still, however, is being confined chiefly to sheets and bars, particularly the former. Structural shapes and plates do not appear to be affected to any extent by the improved demand for warehouse materials generally. While the strike may result in a considerable movement of warehouse supplies, it presents a possibility of considerable difficulty to warehouse interests in keeping up supplies. Prices are firm but unchanged.

Warehouse Prices Unchanged

Boston, Sept. 22.—New England warehouse prices have not changed, although an advance has been expected daily ever since the New York and Chicago districts adopted new schedules. Trading is heavy, particularly in sheets and plates, and this together with the steel situation is said to bring about conditions which compel an early price advance. Galvanized sheets are expected to advance within the next few days, and according to one warehouse man undoubtedly they will go up before the end of the week. For some time past deliveries from the mills have not been keeping pace with sales, and this condition alone points to a rising market.

Sheet Mills are Still Busy

New Demands Coming Out, But Producers are Committed to End of Year—Strike Has Little Effect

Pittsburgh, Sept. 23.—The strike of steel plant workmen has affected the sheet mills considerably less than most of the other finishing mills. A large number of the independent manufacturers are working under agreements with the Amalgamated Association of Iron, Steel and Tin Workers, the members of which have been cautioned not to quit work at such plants. All of these "closed shop" plants are running 100 per cent, but a number of independent mills running as "open shops" also are unaffected. Should the strike become more general and last any considerable length of time, the latter as well as the union plants would be affected through a failure of the sheet bar supply. The Apollo Steel Co., Apollo, Pa., suspended Monday through the failure of enough men to report, but this plant expects to resume shortly as the men are believed to be satisfied, but in fear of bodily injury. Some of the plants of the American Sheet & Tin Plate Co. were adversely affected by the strike, but none of them was obliged to suspend operations. New demands for sheets still are coming out, chiefly from consumers, who are fearful of not obtaining full shipments against their contracts and want to be protected. Little attention is being paid to these demands, as every plant in the country is committed for probable production over the remainder of the year, and manufacturers do not want to obligate themselves into 1920, as they would by taking on new business.

Try to Accumulate Stocks

Philadelphia, Sept. 23.—Sheet business here is good and the market can be considered strong. Makers report that in addition to new orders received, consumers are specifying actively on contracts in order to accumulate a reserve of material in case the strike prevents shipments later. Eastern makers are not affected by the strike so far although it is considered likely that trouble along this line will not be escaped altogether.

Accept No New Business

Youngstown, O., Sept. 22.—With virtually the entire steel producing capacity of the Mahoning valley either closed down or seriously crippled by the strike, books of all important companies have been closed to new business. All of last week witnessed a heavy volume of inquiries for sheets, tubular goods and other products, with the exception of plates. Many buyers were anxious to get on the mills' books before the strike, although the normally swelling demand accounted in large measure for the stimulated business.

The export inquiry continues heavy

with black and galvanized sheets 16 to 30 gage being in exceptional demand. Domestic users are particularly insistent upon Nos. 14, 16, 18 and 22 sheets. Dealers' stocks in the valley are low with pickled sheets for stamping especially scarce and in great demand. One dealer reports a few odd lots of galvanized and blue annealed sheets on hand. Deliveries are difficult, however, because of the lack of common labor. One interesting development of the market growing out of the strike and the consequent shortage of products, is that dealers with stocks on hand are getting from $4 to $10 per ton or even higher premiums above the old price. Because of uncertainty regarding their ability to deliver orders and the price adjustments that will be necessary at the conclusion of the present trouble, producers are flatly refusing to book new business.

Wire Mills

Are Little Affected in Various Districts—Nails Are Sought

New York, Sept. 22.—The plant operations of eastern wiremakers have been practically unaffected by the strike call. The mills at Worcester, Clinton, New Haven, Trenton and Allentown are reported to be operating at 100 per cent. Wiremakers continue to find it necessary to pursue a careful policy in booking business due to the large amount of unfilled orders on their books. In fact, the mills continue to limit their customers to the tonnages which they booked in normal years in the past, as they are unable to exceed those deliveries at present.

Most Makers Down

Pittsburgh, Sept. 23.—The Pittsburgh Steel Co., the Cambria Steel Co., and the Youngstown Sheet & Tube Co. are closed down because of labor trouble and wire mill production consequently is much curtailed. The Jones & Laughlin Steel Co., however, still is running with a full complement of men and the Schoenberger plant of the American Steel & Wire Co. has not lost a man as a result of the strike. Marketwise, conditions are in an unsettled state.

Nails Especially Sought

Chicago, Sept. 23.—Manufacturers of wire and nails find two factors united to increase demand for nails on top of the heavy requirements of the market previously. Settlement of the strike and lockout of the building trades, work being resumed this week, has brought about a tremendous demand for nails through Chicago jobbers. The recent heavy storm on the gulf coast of Texas has given a tremendous increase to the need for nails in that locality. Manufacturers are making special efforts to meet these demands and care for other trade at the same time. Imminence of the steel strike has also caused jobbers and users to ask anticipation of shipments wherever possible.

Ferromanganese Quiz On

Trade Commission Questioning Importers of English Product—Inquiries Light—Little Business in Spiegeleisen

Philadelphia, Sept. 23.—The letter which domestic ferromanganese producers recently sent to federal trade commission accusing English producers of violating antidumping law apparently has had effect of advancing price on English metal. One importer now is offering English metal at $110 delivered which is equivalent to approximately $105, tidewater, the usual method of quoting English metal. The new English figure is the same as the present domestic price. Other English producers continue out of the market. Practically no ferromanganese is being sold. Such inquiry as was pending has been withdrawn owing to the strike.

While some business in spiegeleisen done at $38 furnace it was small and exceptional and metal can be had freely at $35 for 18 to 20 per cent, a round tonnage of spiegeleisen was sold at $35 and several inquiries in market for 1000 to 2000 tons.

Investigation Proceeds

New York, Sept. 22.—The federal trade commission is proceeding with an investigation of charges recently brought by domestic producers of ferromanganese that English makers have been violating the antidumping act. Some of the importers have received inquiries from the commission for information.

No English ferromanganese now is being sold or offered here as far as known, since these producers have withdrawn from the market. At least one of them has no more metal to offer for shipment this year. It is learned that approximately 3000 to 4000 tons of English ferromanganese were sold at $95, c.i.f. Atlantic tidewater, prior to the withdrawal. It appears that there is no foundation for any reports that English ferromanganese was offered at lower than $95. Inquiry for ferromanganese now is limited. One West Virginia user had an inquiry out for a round tonnage but has withdrawn.

Current inquiries for spiegeleisen call for 1000 to 2000 tons. There has been very little business and the market largely is nominal. Metal containing 18 to 22 per cent manganese may be quoted at $35 furnace.

While most of the important Canadian makers of 50 per cent ferrosilicon are asking prices approximating those named by American makers or around $95 to $100 delivered, it is understood some holders of Canadian alloy are making sales much lower. Some of this alloy or further lots of American resale metal figured in the recent sales of small tonnages around $80 to $83 delivered.

The tungsten situation is unchanged. Recently a meeting of consumers and importers of tungsten ore was held in New York to determine the attitude of the trade to the bill now pending to impose a duty on imports. The meeting was unanimously opposed to the amendment imposing a retroactive duty on stocks of ore already here, while opinion as to the bill generally was divided. A committee was appointed to watch the bill. The ferrotungsten market has taken little note of the bill, prices remaining about $1.20 to $1.30 a pound contained.

Ferrovanadium is unchanged at about $6 a pound contained for high silicon alloy and $7 to $7.50 a pound for low silicon alloy. The ferrochrome market is irregular. Some small lots have been sold at 31 cents a pound for 4 to 6 per cent carbon.

Market is Unsettled

Pittsburgh, Sept. 23.—Business in ferromanganese has nearly come to a halt, not so much as a result of the labor troubles as because of uncertainty in regard to prices. Both domestic and English producers recently have quoted $110 on 80 per cent material, the former making the price delivered, while the latter's quotation has been c.i.f. Atlantic seaboard. Latest advices from the East are that most of the English makers have withdrawn all quotations. The market is weak on 50 per cent ferrosilicon, for demands are confined entirely to small lots for immediate shipment. Such sales have averaged about $80, furnace, freight allowed, but less than that price was done recently on sales to Pittsburgh district consumers. Although some makers are holding this material as high as $100, furnace, freight allowed, the market as far as actual sales are concerned is more nearly quotable from $76 to $80. Little interest is noted in the other ferroalloys. Ferrotungsten still is offered as low as $1.15 a pound here.

Tin Plate Mills

Little Affected by Strike—New Inquiries Fairly Numerous

Pittsburgh, Sept. 23.—Beyond the suspension of the operations by the McKeesport Tin Plate Co., which shut down its plant last week because of a congestion in its shipping department, and a walkout of sufficient men to hamper some of the mills of the American Sheet & Tin Plate Co., matters are moving along in the tin plate industry much as though the strike had not been called. Mills working under an agreement with the Amalgamated Association of Iron, Steel and Tin Workers are unaffected, while a number of open-shop plants also are operating at full capacity. Unless the strike becomes more general and lasts long enough to affect supplies of sheet bars, mill operations are likely to continue comparatively full. New tin plate demands still are fairly numerous, especially for export, but most makers are too heavily committed to give them much attention.

Mining Engineers Meet

Conventions of Five Societies Open in Chicago — Fifth Exposition of Chemical Industries Surpasses Previous Shows

CHICAGO, Sept. 22.—An important convention week was ushered in at noon today when the fifth national exposition of chemical industries opened in the Coliseum and the First Regiment armory. The exhibition, which comprises equipment used in the electrochemical, mining and metallurgical industries, occupies every foot of space available in the two large halls and surpasses previous shows of its kind in the number and diversity of products shown. Among the booths in the Coliseum attracting attention is that of the Buffalo Foundry & Machine Co., where vacuum drying apparatus, caustic pots, nitrators, etc., are exhibited. The advance made by American manufacturers of dyes during the war is reflected in the exhibit of the National Analine & Chemical Co., New York, which is displaying fabric dyes, an assortment of colored fabrics, and views of dyeing operations. The exhibit of the Semet-Solvay Co., Syracuse, N. Y., consists of the reproduction of a blast furnace. Electric furnaces, tool steel and pyrometers and other accessories used in the treatment of steel are attractively displayed.

The exposition is being held concurrently with the annual meetings of the American Institute of Mining and Metallurgical Engineers, the American Electrochemical society, the Technical Association of Pulp and Paper Manufacturers, the American Steel Treaters' society and the American Ceramic society. The first technical sessions of the American Institute of Mining and Metallurgical Engineers were held this morning when papers devoted to nonmerrous metallurgy and metallography and coal and gas were read. In the afternoon simultaneous sessions devoted to coal and gas, geology, milling and industrial organization were held. At the last named session, three papers prepared by Charles F. Willis, dealing with the method of curtailing forces, methods of educating workmen and the operation of a system of physical examination for employes were read by T. T. Read, United States bureau of standards, Washington. The paper, entitled "Physical Examination Previous to Employment," was published in the Aug. 7 issue of THE IRON TRADE REVIEW. In this paper, Mr. Willis shows that physical examination before employment has proved satisfactory and presents a strong argument in favor of the system, which is the basis of one of the alleged grievances of labor union agitators. In his paper dealing with educational methods, the author emphasizes the need of administering courses for workmen in accordance with the capabilities, habits and environment of those to be trained. "The educational processes," he states, "must be suited to the existing mental development. Traditional methods of training are unsatisfactory."

Monday evening the members and guests of the institute were entertained at a smoker held at the Chicago University club. At the same time, Gov. Frank O. Lowden, of Illinois, delivered the address of welcome at the exposition. John W. O'Leary, president of the Metal Trades association, of Chicago, spoke on the relation of the chemist to the manufacturer.

Engineers Elect Officers

St. Louis, Sept. 23.—More than 225 members of the Association of Iron and Steel Electrical Engineers have registered at the Hotel Statler for the thirteenth annual convention which began Monday. At a business meeting held this morning, the following officers were elected: President, B. W. Gilson, Carnegie Steel Co., Youngstown, O.; first vice president, H. C. Cronk, McKinney Steel Co., Cleveland; second vice president, F. A. Wiley, Wisconsin Steel Co., South Chicago, Ill.; directors, W. S. Hall, Illinois Steel Co., South Chicago, Ill.; C. E. Bedell, Wheeling Steel & Iron Co., Wheeling, W. Va.; J. E. Fries, Tennessee Coal, Iron & Railroad Co., Birmingham, Ala.; and R. F. Gale, Midvale Steel & Ordnance Co., Philadelphia; treasurer, James Farrington, LaBelle Iron Works, Steubenville, O.; secretary, J. F. Kelly, National Tube Co., McKeesport, Pa. The report of the secretary shows that during the past year a gain of 90 active and 110 associate members was made, bringing the total membership, including firm members, up to more than 1000.

Walter Greenwood, Carnegie Steel Co., Youngstown, O., submitted the report of the safety committee which comprised safety rules for the government of employes working on electrical equipment. A. B. Holcomb, Standard Tin Plate Co., Canonsburg, Pa., presented the report of the educational committee. The necessity of training electrical employes of foreign birth, inspectors, linemen, armature winders and electrical foremen was strongly emphasized. Much attention was attracted by an exhibition of electrical apparatus. The convention will continue until Friday, Sept. 26.

* September shipment rom Singapore, c.i.f. New York.
† American Smelting & Refining Co.'s price.
‡ Producers' price. Outside market unchanged Sept. 17, 22.25c; Sept. 18, 22.12½c; Sept. 19, 21.75c; Sept. 22, 21.50c; Sept. 23, 21.50c; lake, 22c; casting, 21.12½c.

NEW YORK, Sept. 23.—With the steel strike hanging over the markets, activity in the nonferrous metals has been almost suspended the past week. Consumers of metals have shown little interest in their forthcoming requirements, while metal traders have been reluctant to commit themselves in any direction pending definite clue as to the extent and importance of the strike.

The small second hand holders of copper have shown weakness, with resultant shading of prices in the outside market, but the large producers and selling agencies have stood pat. The producers prices for electrolytic copper remain at 23.50c for spot, 24.00c for October delivery. The outsiders have dropped their quotations to 21.50c for spot, 21.75c to 22.00c for fourth quarter. Casting copper is quoted 21.00c to 21.12½c and lake at 22.00c in the outside market. Copper business is extremely slow.

The tin market dropped about two cents a pound the past few business days. As this week opened, Straits tin or September shipment from the Straits could be bought at 53.50c, while shipment in October, November or December was quoted 53.25c, declines of about a cent. These positions now are 52.75c and 52.50c. Spot tin prices dropped under pressure of the arrival of several unsold lots from England. Spot Straits is 55.00c.

The zinc market suffered as a result of the steel labor agitation, prices dropping 15 points in two days, to 7.00c East St. Louis, for prompt and September shipment, 7.10c for last quarter shipment.

American Smelting & Refining Co. advanced its lead price last week to 6.25c, New York, 6.00c East St. Louis, following which action independent producers also put their prices at that level.

Strike Failing at Vital Points

Drive at Iron and Steel Industry by Radical Leaders of American Federation of Labor Falls Far Short of its Goal — Only 20 Per Cent of Workers Who are Idle are Strikers—Ninety-five Per Cent of Latter Foreigners

LATEST reports from the centers of the strike in the iron and steel industry show that the drive launched Sept. 22 by the radical leaders in the American Federation of Labor not only failed to attain its objective but has met with some serious reverses which indicate its ultimate defeat.

The strike is proving not only the most ill-advised and ill-timed of all great labor disturbances in the history of the country, but the most unAmerican and most unpopular as well. Standing out above all other features of interest to the general public is the fact that it is a strike primarily of foreigners against one of the nation's most important industries—a strike of foreigners on American soil that has thrown out of employment thousands of American workmen, whose sympathies are not with the strikers.

How long the handful of extremists in the American federation can thus withhold employment from loyal American workmen is problematical, but there are strong indications on every side that public sentiment is aroused.

Blast Furnaces are Seriously Crippled

The relatively few Americans who are members of newly organized unions are reported to be dissatisfied with the strike, while the great body of workmen forced into idleness are bitter. A conservative estimate places the proportion of those who are out of their own free will at but 20 per cent of the total number of those idle. Further, it is estimated that 95 per cent of the bona fide strikers are foreigners. The foreigners, mostly all of whom are laborers and illiterate, are keeping from work men who earn from $10 to $30 a day.

In the Pittsburgh, Wheeling and Youngstown districts the latest returns indicate that 80,000 men are out, only 16,000 of whom are organized and went out on strike. In the Pittsburgh district operations on Tuesday were much better than on Monday.

Blast furnaces were the most seriously crippled of all the industries in western Pennsylvania and through the valley, due to the preponderence of common and foreign labor employed. The number of active stacks of the Carnegie Steel Co., has been reduced from 47 to 20 since the outbreak of the strike, while 10,000 of the 52,000 men employed by the company are idle. This company, in common with other interests, declares that 95 per cent of the American workmen are loyal.

Union leaders commanded considerable strength in the Youngstown district, principally among the alien workers. It is estimated that 30,000 men are out. With the exception of the Trumbull Steel Co., and the Liberty Steel Co., in Warren, O., both companies employing 5700 men, operations in every large iron and steel plant in the Youngstown district are suspended. Work in the mills also is stopped, the members of the Amalgamated Association of Iron, Steel and Tin Workers being thrown out of employment. The members have a contract with the mills, and pledged themselves to honor it. But while their president, M. F. Tighe, a member of the American Federation of Labor, ordered them to abide by the contract, other members of that same federation were calling out men whose absence made the fulfillment of the contract impossible.

Out of 20 iron and steel plants in the Cleveland district, only those of the Empire Rolling Mill Co., the Union Rolling Mill Co., the Riverside and Lakeside plants of the Otis Steel Co., and the blast furnaces of the latter company are operating. All plants of the American Steel & Wire Co., the only subsidiary in the district of the United States Steel Corp., have suspended operations. Union estimates of 20,000 men idle are disputed by the employers, who claim the majority of those actually out are loyal workers who have been intimidated, or who are unable to work because plants are shut down.

The only plant of which there is a record wherein the members of the Amalgamated association voluntarily violated their agreement is that of the Lake Erie Nut & Bolt Co., Cleveland. Tighe threatened to revoke the charter of the local union if the men did not return.

Practically the entire iron and steel industry in the Chicago district is tied up, and the companies are not making any efforts to combat the strike. In this district strikers went the limit in their efforts to terrorize those who refused to join them. They did not succeed with other measures so much as they did in intimidating the wives of the workers. The women were told that the men would be killed if they persisted in working. Employers have called a meeting to decide combative measures on the question of shutting down all plants.

Three plants in the Buffalo district are tied up. The Lackawanna Steel Co. has suspended, the Rogers, Brown Co. has suspended, and the Donner Steel Co. has announced its decision to suspend, with 10,000 men out.

Southern Territory Not Greatly Affected

The strike has not greatly affected plants in the St. Louis district, Birmingham district, eastern Pennsylvania and New England, while all plants on the Pacific coast are operating as usual. All employes in the St. Louis district are at work, and in Alabama, the Tennessee Coal, Iron & Railroad Co., and American Steel & Wire Co., report more men were at work Tuesday than on Monday. These two companies are operating their plants in Alabama at practically the same rate as before the strike was called. No trouble has been experienced, although union organizers are making frantic appeals to the men. In the New England states, where there has been considerable labor disturbances during the past few months, all iron and steel plants are reported to be operating without trouble.

Repeated efforts have been made by officials of the unions represented in the strike to involve others, but thus far the federation as a national body has not attempted to call out organized labor in other trades. A deadlock in the iron and steel strike may cause the federation to throw its weight in favor of the strikers, although for the present it is pursuing a policy of watchful waiting, with President Gompers remaining aloof and not in any way antagonizing the wishes of President Wilson.

The miners of the country in conference in Cleveland voted to leave the matter of a sympathy strike to the officials of their union, thus postponing action on the issue

which was brought before them. In a few instances, switchmen and dock workers have quit, but the number is inconsequential. Officials of the lake seamen's union claim that the seamen's ballot on the question of a strike favored a walkout, but they must now meet and canvass the vote. From developments in the strike thus far it is apparent that the conservative leaders in the American Federation of Labor still retain control. It must be patent to them that to sanction a nation-wide strike to support the union steel workers would be to plunge the country into industrial chaos—and they have succeeded in keeping a steady hand on the helm, thus far.

The United States senate has passed a resolution providing for an investigation of the strike by a committee, and it is reported that E. H. Gary, chairman of the United States Steel Corp., will be asked to testify, together with John J. Fitzpatrick, chairman of the national committee organizing the steel workers.

Comparatively little violence has broken out in the strike districts, although some companies complain that police protection for nonunion workers has not been adequate. Resentment against the strikers has found expression in many localities. Near Pittsburgh business men and farmers at one furnace town became so aroused over the fact that foreigners interfered with the operations of a plant that they offered their own services to operate it.

PITTSBURGH: *Situation Improves as Some Men Return; Furnaces Affected Most, Due to Aliens*

PITTSBURGH, Sept 23.—The second day of the strike finds the situation in the Pittsburgh district better from the standpoint of the manufacturers than it was the first day, due to the fact that in a number of the plants workmen who stayed away on Monday returned to work Tuesday.

The National Tube Co. is practically unaffected by the strike, while the American Bridge Co. is running with its full complement at Ambridge, Pa. The Schoenberger works of the American Steel & Wire Co., have not lost a man, while among the independents, the Jones & Laughlin Steel Co., had less than 100 men quit work and is running substantially full.

More men reported for work today at the plants of the Allegheny Steel Co. and the West Penn Steel Co., at Brackenridge, Pa., which permitted those companies to increase their operations. The Cambria Steel Co., Johnstown, Pa., is down in all departments, and the word from the valley districts is to the same effect. The Pittsburgh Steel Co. is down, but the Crucible Steel Co. and the Carbon Steel Co. are operating to some extent.

Summing up the entire situation in western Pennsylvania and the valley districts, it seems that blast furnace operations have been more seriously crippled than any other branch of the iron and steel industry. This is due to the preponderance of foreign laborers at the blast furnaces. All but a few of the active merchant stacks are banked.

The Carnegie Steel Co. reports a decrease in the number of its active stacks from 47 to 20 since the inauguration of the strike. This does not mean that all of the men were either unionized or desirous of quitting. Plants of this company in the Youngstown district are affected by the presence of men from other plants who are intimidating the workers, because police protection is lacking. It is estimated that about 10,000 of the 52,000 men employed at the various plants of the Carnegie Steel Co. are idle, the bulk of them in the Youngstown district. An official statement issued by the Carnegie Steel Co., says that in every instance where men are out, they are the foreign and unskilled men. Ninety-five per cent of the American workmen remained at work. This is the experience of practically all companies.

Sheet mills are doing better than a number of other kinds of finishing mills. A number of the mills of the American Sheet & Tin Plate Co., are so isolated as to have escaped the attention of the organizers, while a number of the independents are working under agreement with the Amalgamated Association of Iron, Steel and Tin Workers, members of which are not subject to the strike call.

At least 12 of the independent mills are running with a full quota of men. A number of bar iron mills are running as a result of an agreement with the Amalgamated association, but at the skelp mills of the A. M. Byers Co., in Girard, O., common laborers at its blast furnace, and laborers of the Brier Hill Steel Co., which supplies the Byers company with some of its iron, went out. This left the puddlers without iron supplies, the latter being obliged to quit, although willing to work. The Lockhart Iron & Steel Co. and Brown & Co., Pittsburgh, makers of bar iron, are unhampered.

Roughly estimated, about 80,000 men are idle in the Pittsburgh, Wheeling and Youngstown districts. How many of these are striking is a question, but it is not believed they constitute more than 20 per cent.

YOUNGSTOWN: *All Iron and Steel Plants Suspended Except Two in Warren; 30,000 Idle*

YOUNGSTOWN, O., Sept. 23.—With the single exception of the Trumbull Steel Co., and the Liberty Steel Co., at Warren, both employing 5700 men, operations in every important iron and steel mill in the Youngstown district were completely stopped Tuesday. The Warren concerns have contracts with the Amalgamated Association of Iron, Steel and Tin Workers, but have not recognized any of the other unions concerned in the present walkout. Continuation of this policy is expected to result in the closing down of the Trumbull and Liberty plants through a strike of common laborers and other employes not of the Amalgamated association.

The strikers in the Youngstown district are largely made up of foreigners and common laborers, with union electricians and machinists joining in the walkout. Skilled mechanics and members of the Amalgamated association were thrown out of work because of the insufficiency of other labor to keep plants operating. Some of the Youngstown fabricating plants were affected by the strike Monday. The unions, however, urged the men to return to work and operations there were normal today.

Nearly 30,000 men are idle in this district, about 20,000 having struck, the others being compelled to stay

away because of intimidation and because work could not be provided. The following plants with the number of men out in each one were reported late Monday:

The Brier Hill Steel Co., Youngstown, O., completely down, 3400 men out. The Empire and Thomas works of the Brier Hill at Niles down, 1100 men. The Western Reserve works of the Brier Hill at Warren, 500 men, down.

Republic Iron & Steel Co., at Youngstown, completely down. With the exception of a few hundred men around the plant doing guard duty and performing other work, the Deforest Sheet & Tin Plate Co., at Niles, a Republic subsidiary, 700 men, completely down.

The Ohio works of the Carnegie Steel Co. are down and the blast furnaces banked; 8000 men out.

Sharon Steel Hoop Co., Hazelton and Lowellville works, 1400 men, down.

Struthers Furnace Co., 150 men, furnace banked.

The A. M. Byers Co., Girard, 1100 men, closed.

Mahoning Iron & Steel, Mineral Ridge, 500 men, closed.

The Youngstown Sheet & Tube Co., 11000, not operating at all.

Ohio Iron & Steel Co., at Lowellville, 230 men, closed.

All the companies that have contracts with the Amalgamated association report that the members of this union were anxious to work but that the plants were crippled to such an extent by the walkout of others that it was impossible for them to keep at work.

The Mahoning Valley Steel Co., at Niles, employing 700 men, is operating, as it has an Amalgamated contract.

CHICAGO: *Practically Entire Iron and Steel Industry Tied Up*

CHICAGO, Sept. 23.—The strike has largely tied up iron and steel production in the Chicago district. The United States Steel Corp. subsidiaries and the larger independent producers are not yet adopting aggressive measures to fight the strike, although families of the men who are working are being intimidated by the strikers. The Illinois Steel Co. is blowing four stacks each at Gary and South Chicago, but the finishing mills are idle. The Inland Steel Co. and the Steel & Tube Co. of America and the Wisconsin Steel Co. have banked all their blast furnaces. The American Steel & Wire Co. plants in Joliet, Waukegan, and others are practically closed. The smaller mills in South Chicago, including the Hubbard Steel Co., the Pollak Steel Co. and the Riverdale Iron & Steel Co. have been closed. The Federal Furnace Co. has been blown out and the only active stack of the Iroqois Iron Co. has been banked. The Interstate Iron & Steel Co.'s plants are running by agreement with the union. The Inland Steel Co.'s rerolling plant in Chicago Heights, Republic Iron & Steel Co.'s mills at Moline and East Chicago, also are unaffected, under the agreement with the Amalgamated association. The By-Products Coke Corp. plant is idle which will affect the foundries when stocks are gone.

The Inland Steel Co. had at work Monday morning 60 per cent of its first shift, but intimidation of their wives by the strikers caused the men to quit. A large number of the men are willing to work if protection is furnished the families, and in a conference today all employers were to decide what course to pursue, and they may shut down all plants. It is impossible to estimate the exact number of men striking, since so many are absent from work.

NEW ENGLAND: *All Workers are Loyal*

WORCESTER, Mass., Sept. 23.—New England is free of labor trouble in the steel industry and is expected to remain so regardless of the length of the general strike. The American Steel & Wire Co. is the largest producer, employing 5500 men in its three Worcester works and about 500 in its New Haven, Conn., works. Not a man was missing at any of the works Monday or Tuesday. The employes do not belong to unions and are not likely to be organized.

The Clinton Wright Wire Co., with four plants in Worcester, and one each in Spencer and Palmer, Mass., employing more than 2000 men, is free of trouble. About 200 employes of the Wright wire division of the Clinton Wright company are members of the recently organized wire workers' union, which has voted not to strike. No trouble is reported in any other part of New England.

Officials of the American Steel & Wire Co. say works in the Worcester district are running to capacity, and cannot take additional work from other plants affected by the strike, because they are booked ahead for many months.

Ore Shipments May be Stopped by Strike

Cleveland, Sept. 23.—Ore companies have been informed that the railroad administration is considering the advisability of declaring an embargo on the shipment of ore from lower lake docks to those furnaces which have been forced to suspend operations. Officials of the administration say that it is useless to tie up cars by sending them to furnaces which cannot unload them, much less consume the ore. If the embargo is declared, and if shipments from upper lakes districts continue at their present rate, ore companies say that all storage space at lower lake ports will be filled within two or three weeks. Such a situation would force the suspension of shipments and dam up the ore at the mines, regardless of what action the lake seamen may take in regard to a sympathy strike.

Union seamen on ore boats have completed balloting on the question of striking and their officers claim that the vote was almost unanimous in favor of a strike. The union's executive board is to meet at Detroit or Chicago to canvass the vote, the date for the meeting not being announced. It was reported last week that the lake seamen had decided to strike and present new demands, but action is being deferred until the leaders estimate the strength of the strike in the iron and steel industry. In the meantime, some disaffection is apparent on some of the docks at receiving ports. Unloading plants at South Chicago and Indiana harbor are reported idle, while at Gary, Ind., only two rigs are said to be in operation. The dock of the Cleveland Furnace Co. was idle on Monday, as were two docks at Buffalo which were forced to suspend operations because power furnished by steel plants was cut off.

The prospect of the forced suspension of shipments is said to be having some influence against a strike of the lake seamen. During the strike of workers on the ore docks the seamen, though idle, received full pay, and they would receive pay if forced into another period of idleness. They cannot help the iron and steel strikers

to any great extent by striking, but they can make a "sympathy" strike the occasion for pressing their own demands.

Ore companies have taken every possible means of getting their ore through to the furnaces ever since the strike in the iron and steel industry was threatened. Many furnaces are well supplied, and particularly those of the United States Steel Corp. While ore companies were insistently pointing out to independent furnace interests early in the season the desirability of getting in supplies, the Steel corporation was shipping from 60 to 80 per cent of the total tonnage brought down. Its shipments up to Sept. 1 averaged 58 per cent, approximately 17,171,000 tons.

CLEVELAND: *Amalgamated Men Violate Contract*

CLEVELAND, Sept. 23.—Conditions in the Cleveland district were not greatly changed Tuesday from the first day of the strike, although union leaders claimed that the total number of men out increased from 18,000 to 25,000. This was denied by company officials, who stated that developments were in their favor. Actual strikers, mill owners contend, do not number more than 40 per cent of those out, the others being forced into idleness. Out of the 20 plants in Cleveland, only those of the Empire Rolling Mill Co., the Union Rolling Mill Co., the Riverside and Lakeside plants and the two blast furnaces of the Otis Steel Co., are operating. The two former companies have agreements with the Amalgamated Association of Iron, Steel and Tin Workers.

Tuesday it developed that workmen at the plant of the Lake Erie Nut & Bolt Co. had walked out against the orders of the Amalgamated association, of which they are members, and with which the company has an agreement. This action evoked a threat from their president, M. F. Tighe, that unless the men returned to work the local's charter would be revoked. Despite this, the men have not returned to work.

All plants of the American Steel & Wire Co., the only subsidiary in this district of the United States Steel Corp., are closed. The plant of the McKinney Steel Co., the largest independent producer in the district also is closed, including the furnace, open hearth department and mills. Operations have been suspended at the plant of the Cleveland Steel Co., and the plant of the Upson Nut Co.

Officials of the various companies state that the majority of workmen allied with the union are foreigners and that practically all native American workmen are anxious to work, but are restrained through fear of bodily injury. That the zeal of the strikers is waning is shown by the falling off in the number of men attending various rallies. Fifteen thousand foreigners attended a rally Monday, but at a meeting Tuesday only 3000 workmen turned out.

BUFFALO: *Three Plants Tied Up; 10,000 Men Reported Out*

BUFFALO, Sept. 23.—Steel workers succeeded this morning in tying up the three plants in which a strike had been called. Over 10,000 or 95 per cent of the working force of these plants are on strike.

The Lackawanna Steel Co. suspended operations today. Less than one-quarter of their employes reported for work Monday morning and the Monday night and Tuesday morning shifts were so depleted as to preclude operation. The Lackawanna company employed 7500 men. The Donner Steel Co. of Buffalo is to suspend operations tonight or tomorrow. The company employs 2500 men. Up to noon today the two furnaces of the Donner company at Tonawanda, N. Y., were not affected. The Rogers-Brown Co. was forced to shut down Monday when 500 men, its entire working force, went on strike. No strike has yet been called at any of the other steel plants in this district.

W. H. Donner, president of the Donner Steel Co., said hundreds of his men would have reported for work, but for intimidation by strikers.

BIRMINGHAM: *Men Return; Plants Active*

BIRMINGHAM, Ala., Sept. 23.—The strike of iron and steel workers in the Birmingham district has been a failure. All plants of the Tennessee Coal, Iron & Railroad Co., and the American Steel & Wire Co., subsidiaries of the United States Steel Corp., are operating. Two departments in the wire plant suffered a little hindrance Monday. A conservative estimate for the four plants here, which employ under normal conditions upward of 7000 to 10,000 men, is that less than 500 went out on strike Monday and many of them were foreigners. Early Tuesday morning the foreigners began seeking reinstatement, claiming to have been misinformed as to the strike. More men were working Tuesday than on Monday. Not the least disorder was reported about the works here, and Chief of Police Shirley reduced his forces materially on the second day of the strike. Steel rails left the Ensley plant today enroute to San Francisco and Japan. Ingots were shipped Monday as usual to the Fairfield wire mill, to Bessemer, for the rolling mill, and to Westfield for the new fabricating works.

PHILADELPHIA: *Few Plants Affected*

PHILADELPHIA, Sept 23.—Although eastern steel plants are not yet affected much by the strike, the opinion prevails here that they will not escape. In fact, eastern producers gard the present situation holds possibilities for a tieup of the industry. However, they believe the strike must be fought to a finish, as a victory by labor unions would pave the way to an ultimate industrial cataclysm. Much fault is found with the daily newspapers, which evidently do not appreciate the real factors involved in the strike.

Practically the only mills affected in the East were those at Coatesville where on Monday 1200 men were out at the Midvale Iron & Steel Co.'s plant, and several hundred at the Lukens Iron Co.'s plant. The strikers were later replaced.

Philadelphia, Birthplace of A. F. A., Welcomes Foundrymen

Independence Hall
The Home of the Liberty Bell

FOR five days beginning Monday, Sept. 29, Philadelphia, the birthplace of American independence and the home of the first convention of the American Foundrymen's association, will for the third time entertain the foundrymen of the United States, Canada and abroad. As heretofore, the convention this year will include the annual meeting of the Institute of Metals division of the American Institute of Mining and Metallurgical Engineers. It is especially fitting that the twenty-fourth annual meeting of foundrymen, the first in five years to be held in time of peace, is to take place in the city founded by William Penn, America's first well-known advocate of peace. The spirit of war, which so thoroughly entered into the activities of the last five annual meetings, will be noticeably absent this year. Especially striking will be the contrast between the Philadelphia and Milwaukee conventions. Last year, in the midwestern city, the enthusiasm of the 4000 foundrymen in attendance was focused exclusively on the work of winning the war; during the week of Sept. 29, the interest of foundrymen will be centered upon the problems of reconstruction.

Evidence of many developments peculiar to the present era will be reflected in this year's convention. In keeping with the tendency toward closer international relations, the Philadelphia meeting will be marked by a distinctive cosmopolitan aspect to a degree never before approached. In view of this development, the meeting has been named the Inter-Allied Foundrymen's Convention and Exhibition. The return of peace is permitting foundrymen to direct their efforts along lines neglected during the war. Striking proof of this is found in the space requirements of exhibitors who have demanded more than 60,000 square feet, an increase of 43 per cent over any previous show. The removal of the restraint of war also will be reflected in the program of technical papers. A special session on industrial relations has been arranged in order that the broad aspects of that problem, which are absorbing so much attention at this time, may be intelligently discussed. The consideration of reconstruction questions also will hold a prominent place in the program of technical papers to be presented before the American Foundrymen's association at sessions on steel, malleable, gray-iron and general foundry practice, and in the dozen or more papers to be presented at sessions of the Institute of Metals division of the American Institute of Mining and Metallurgical Engineers. The 1919 annual meeting promises to outclass all previous conventions in every respect, and will emphasize, as never before, the tremendous growth of the association since its first annual meeting in the Quaker city, 23 years ago. Although the opening sessions of the convention are scheduled for Tuesday morning, the registration office in the assembly room, Commercial Museum, will open Monday morning, Sept. 29, at 10 o'clock.

Condensed Program

Monday, Sept. 29

10:00 A. M.—Registration, Philadelphia Commercial Museum.

10:00 A. M.—Opening of exhibition, Philadelphia Commercial Museum.

Tuesday, Sept. 30

10:00 A. M.—Joint session, American Foundrymen's association and Institute of Metals division of the American Institute of Mining and Metallurgical Engineers, ball room, Bellevue-Stratford hotel.

2:30 P. M.—Opening session, Institute of Metals division, American Institute of Mining and Metallurgical Engineers, Ritz-Carlton hotel.

Afternoon—Boat ride on the Delaware river, terminating with a visit to the Hog Island shipyard.

Wednesday, Oct. 1

10:00 A. M.—Professional session, American Foundrymen's association, ball room, Bellevue-Stratford hotel, for the discussion of general topics.

10:00 A. M.—Steel session, American Foundrymen's association, clover room, Bellevue-Stratford hotel.

10:00 A. M.—Professional session, Institute of Metals division of American Institute of Mining and Metallurgical Engineers, Ritz-Carlton hotel.

11:00 A. M.—Automobile trip for the ladies through Fairmount park to Valley Forge, where luncheon will be served.

2:00 P. M.—Golf tournament, Whitemarsh Valley Golf club.

8:00 P. M.—Theater party for ladies and gentlemen at Keith's.

Thursday, Oct. 2

10:00 A. M.—Gray iron session, American Foundrymen's association, ball room, Bellevue-Stratford hotel.

10:00 A. M.—Malleable iron session, American Foundrymen's association, clover room, Bellevue-Stratford hotel.

10:00 A. M.—Industrial relations session, American Foundrymen's association, red room, Bellevue-Stratford hotel.

10:00 A. M.—Professional session, Institute of Metals division, American Institute of Mining and Metallurgical Engineers, Ritz-Carlton hotel.

1:30 P. M.—For the ladies, a visit to Wanamaker's store, plant of the Curtis Publishing Co., Independence hall, and other points of interest in Philadelphia.

7:00 P. M.—Annual banquet, Bellevue-Stratford hotel, followed by dancing.

Friday, Oct. 3

10:00 A. M.—Professional session, American Foundrymen's association, ball room, Bellevue-Stratford hotel.

Program, American Foundrymen's Association

Monday, Sept. 29

10:00 A. M.—Registration, Philadelphia Commercial Museum.

10:00 A. M.—Opening of exhibition, Philadelphia Commercial Museum.

Tuesday, Sept. 30

10:00 A. M.—Joint opening session, American Foundrymen's association and Institute of Metals Division, American Institute of Mining and Metallurgical Engineers, Ball room, Bellevue-Stratford hotel.

Address of welcome, by Thomas Devlin, Thomas Devlin Mfg. Co., Philadelphia.

Response to the address of welcome, by A. O. Backert, president of the American Foundrymen's association.

Report of secretary-treasurer, American Foundrymen's association, Inc.

Report of board of directors, American Foundrymen's association, Inc.

Annual address by A. O. Backert, president, American Foundrymen's association.

"Considerations Affecting Brass Melting in Gray Iron Shops," by Russell R. Clarke, Eagle Brass Foundry, Seattle, Wash.

"The Weeks Electric Rotating Furnace as Applied to the Brass Foundry Industry," by F. J. Ryan, American Metallurgical Corp., Philadelphia.

"The Need for Co-operative Research in Alloys," by H. E. Howe, National Research Council, Washington, D. C.

Report of the American Foundrymen's association committee on foundry costs, by J. Roy Tanner, chairman, Pittsburgh Valve Foundry & Construction Co., Pittsburgh.

"Publicity Work of Foundry Equipment Manufacturers' Association," by Franklin G. Smith, chairman, publicity committee, Foundry Equipment Manufacturers' association, Cleveland Osborn Mfg. Co., Cleveland.

Appointment of nominating committee and committee on resolutions.

1:30 P. M.—Boat ride on the Delaware river, terminating with a visit to the Hog Island shipyard.

Wednesday, Oct. 1

General Topics

10:00 A. M.—Professional session, American Foundrymen's Association, Ball room, Bellevue-Stratford hotel.

"Audible Signals in Foundries," by Prof. Vladimir Karapetoff, Ithaca, N. Y.

"How to Secure Best Results in Combining Hoisting Apparatus with Molding Machines," by W. C. Briggs, Shepard Electric Crane & Hoist Co., New York.

"Foundry Sand-Handling Equipment," by H. L. McKinnon, The C. O. Bartlett & Snow Co., Cleveland.

"Concrete Foundry Molding Floors," by H. H. Haley, American Foundry Equipment Co., New York.

"The Care of Foundry Equipment," by G. L. Grimes, Grimes Molding Machine Co., Detroit, Mich.

"Uniform Methods of Cost Accounting," by C. E. Knoeppel, C. E. Knoeppel & Co., New York.

Report of the nominating committee and election of directors of the American Foundrymen's association, Inc.

Steel Session

10:00 A. M.—Professional session, American Foundrymen's association, Clover room, Bellevue-Stratford hotel.

"Electric Versus Converter Steel," by John Howe Hall and G. R. Hanks, Taylor-Wharton Iron & Steel Co., High Bridge, N. J.

"Effect of Sulphur in Steel Castings," by Professor A. E. White, University of Michigan, Ann Arbor, Mich.

"Repairing Castings on Transport Northern Pacific," by Arthur F. Braid, Metal & Thermit Corp., New York.

"Comparison of Costs of Electric and Open Hearth Furnace Practice," by E. H. Ballard, West Lynn, Mass.

Report of the American Foundrymen's Association Committee on Steel Foundry Standards, by W. A. Janssen, chairman, American Steel Foundries, Chicago.

"Operation of the Acid Electric Furnace," by L. B. Lindemuth, Carney & Lindemuth, New York.

"Values of the Present Methods of Measuring the Temperature of Molten Steel," by F. W. Brooke, Electric Furnace Construction Co., Philadelphia.

Entertainment Features

11:00 A. M.—Automobile trip for the ladies through Fairmount park to Valley Forge, where luncheon will be served.

2:00 P. M.—Golf Tournament, Whitemarsh Valley Golf club.

8:00 P. M.—Theater party for ladies and gentlemen at Keith's.

Thursday, Oct. 2

Gray Iron Session

10:00 A. M.—Professional session, American Foundrymen's association, Ball room, Bellevue-Stratford hotel.

"The Elimination of Strains in Iron Castings," by C. J. Wiltshire, General Electric Co., Schenectady, N. Y.

"The Value of a Scrap Pile," by Henry Traphagen, Toledo Steel Castings Co., Toledo, O.

"The Electric Furnace as an Adjunct to the Cupola," by George K. Elliott, Lunkenheimer Co., Cincinnati.

Report of the American Foundrymen's Association Committee on General Specifications for Gray Iron Castings, Dr. Richard Moldenke, Watchung, N. J.

"Side Blow Converter in Iron Foundry," by George P. Fisher, Whiting Foundry Equipment Co., Harvey, Ill.

"The Testing of Clays for Foundry Use," by Homer F. Staley, Bureau of Standards, Washington.

"Cerium in Cast Iron," by Dr. Richard Moldenke, Watchung, N. J.

Malleable Session

10:00 A. M.—Professional session, American Foundrymen's association, Clover room, Bellevue-Stratford hotel.

"Burning Fuel Oil in an Air Furnace," by J. P. Pero, Missouri Malleable Iron Co., E. St. Louis, Ill.

"The Application of Powdered Coal to Malleable Annealing Furnaces," by Charles Longenecker, The Bonnot Co., Pittsburgh.

"Efficient Use of Pulverized Coal in Malleable Foundry Practice," by Milton W. Arrowood, Ground Coal Engineering Co., Chicago.

"Powdered Coal as a Fuel in the Foundry," by H. A. Grindle, Combustion Economy Corp., Chicago.

"Relation Between Machining Qualities of Malleable Castings and Physical Tests," by Edwin K. Smith and William Barr, Wisconsin Malleable Iron Co., Milwaukee.

"The Refining of Cupola Malleable in the Electric Furnace," by A. W. Merrick, General Electric Co., Schenectady, N. Y.

Report of the American Foundrymen's Association Committee on Specifications for Malleable Castings, by Enrique Touceda, chairman, Albany, N. Y.

"Some Needs of the Malleable Iron Industry," by W. P. Putnam, Detroit Testing Laboratory, Detroit.

"A Note on Britain's Experimental Foundry," by G. Ernest Wells, Edgar Allen & Co., Sheffield, England.

"Galvanizing Malleable Castings," by Prof. Enrique Touceda, Albany, N. Y.

"Effects of Annealing Gray and Malleable Iron Bars in Copper Oxide Packing," H. E. Diller, THE FOUNDRY, Cleveland.

Industrial Relations Session

10:00 A. M.—Professional session, American Foundrymen's association, Red room, Bellevue-Stratford hotel.

"Training Men for Foundry Work," by C. C. Schoen, U. S. Dept. of Labor, Stamford, Conn.

"Personnel Problems of Modern Industry," by C. D. Dyer Jr., Hunt & Dyer, Philadelphia.

"Industrial Democracy and The Foreman," by John Calder, Business Training Corp., New York.

Report of the American Foundrymen's Association Committee on Safety, Sanitation and Fire Protection, by Victor T. Noonan, U. S. Mutual Liability Insurance Co., Quincy, Mass.

"Vocational Training for Foundry Occupations," by J. C. Wright, Federal Board for Vocational Education, Washington.

Entertainment Features

1:30 P. M.—For the ladies, visit to Wanamaker's store, plant of the Curtis Publishing Co., Independence hall, and other points of interest.

7:00 P. M.—Annual banquet, Bellevue-Stratford hotel, followed by dancing.

Friday, Oct. 3

General Topics

10:00 A. M.—Professional session, American Foundrymen's association, Ball room, Bellevue-Stratford hotel.

"The Economical Control and Handling of Patterns in a Large Foundry," by W. D. Jones, Canton Steel Foundry Co., Canton, O.

"Progress in the Application of Electric Arc Welding," by Robert E. Kinkead, Lincoln Electric Co., Cleveland.

"A New Cutting Gas," by Professor Alfred S. Kinsey, Stevens Institute of Technology, Hoboken, N. J.

"Welding Castings of Different Metals and Different Sections," by George B. Malone, Bayonne Steel Casting Co., Bayonne, N. J.

Report of the American Foundrymen's Association Committee Advisory to the United States Bureau of Standards, by Dr. Richard Moldenke, Watchung, N. J.

Report of American Foundrymen's Association Committee on Promotion and Membership, by A. E. Howell, chairman, Nashville, Tenn.

"High Temperature Cement for Lining Cupolas, etc.," by W. S. Quigley, Quigley Furnace Specialties Co., New York.

Installation of officers.

Departing from the precedent set in previous years, the exhibition of foundry, machine shop and rolling mill equipment in the Commercial Museum will open at 10 o'clock a. m., somewhat earlier than usual. Also the exhibition will be open Tuesday evening. The formal opening of the convention will take place in the ball room of the Bellevue-Stratford hotel, Tuesday morning, at 10 o'clock, when members of the American Foundrymen's association and Institute of Metals division of the American Institute of Mining and Metallurgical Engineers will convene in a joint session. The address of welcome, annual address of the president of the American Foundrymen's association, and reports of the board of directors and the officers of the organization will be presented at this session, together with papers on brass foundry practice. The first professional session of the Institute of Metals division will be held at 2:30 p. m., Tuesday, in the Ritz-Carlton hotel, and will be followed by two other sessions in the same hotel at 10 a. m., Wednesday and Thursday mornings. Condensed and detailed programs of both organizations appear elsewhere in this issue. The technical papers prepared for the American Foundrymen's association cover a wide range of subjects of unusual interest to foundrymen. Eleven distinct subjects are treated in the papers on miscellaneous subjects scheduled for presentation at the three sessions devoted to general topics. The authors of these papers will touch upon publicity work, the use of audible signals in foundries, combining hoisting apparatus with molding machines to good advantage, sand handling equipment, concrete floors for foundries, the care of foundry equipment, uniform methods of foundry cost accounting, scientific management as applied to foundries, handling patterns in a large foundry, various problems of welding castings by the electric arc and gas processes, and the use of high temperature cement for lining cupolas. Six papers will be presented at the steel session to be held Wednesday morning. "Electric versus Converter Steel" is the subject of a paper to be presented by John Howe Hall and G. R. Hanks. E. H. Ballard will compare the costs of electric and open-hearth furnace practice. Moving pictures showing the welding of a large steel casting on the transport NORTHERN PACIFIC, which went aground off Fire island in January, will accompany a paper on that subject to be presented by Arthur F. Braid. W. A. Janssen, chairman of the committee on steel foundry standards, will submit the report of that committee. Among the subjects to be discussed in the six papers scheduled for the gray-iron sessions to be held Thursday morning are, "The Elimination of Strains in Cast Iron," by C. J. Wiltshire; "The Testing of Clays for Foundry Use," by Homer F. Staley; and "The Electric Furnace as an Adjunct to the Cupola," by George K. Elliott. The use of powdered coal in malleable practice will be discussed in three of the 10 papers to be presented at the malleable iron session to be held Thursday morning simultaneously with the sessions on gray-iron and industrial relations. A paper entitled, "A Note on Britain's Experimental Foundry," by G. Ernest Wells, Edgar Allen & Co., Sheffield, England, who was in the British ministry of munitions, is expected to prove of unusual interest to American foundrymen who have not had frequent opportunities to obtain first-hand information on English foundry practice. Prof. Enrique Touceda will discuss malleable castings and H. E. Diller will outline the results of annealing gray and mal-

Carpenters' Hall
Where Continental Congress First Met

Program, Institute of Metals Division, A. I. M. M. E.

Monday, Sept. 29

10:00 A. M.—Registration, Ritz Carlton hotel.

10:00 A. M.—Opening of exhibit, Philadelphia Commercial Museum.

7:00 P. M.—Meeting and dinner of the executive committee.

Tuesday, Sept. 30

10:00 A. M.—Joint opening session, American Foundrymen's association and Institute of Metals Division, American Institute of Mining and Metallurgical Engineers, ball room, Bellevue-Stratford hotel. A. O. Backert, chairman, president American Foundrymen's association. (See American Foundrymen's program for details.)

2:30 P. M.—Professional session, Institute of Metals Division, Ritz-Carlton hotel.

Physical Properties of Nickel, by David H. Browne and J. F. Thompson.

Some properties and Applications of Rolled Zinc Strip and Drawn Zinc Rod, by C. H. Mathewson, C. S. Trewin and W. H. Finkeldey.

Afternoon—Boat ride on the Delaware river, terminating with a visit to the Hog Island shipyard.

Wednesday, Oct. 1

10:00 A. M.—Professional session, Institute of Metals Division, Ritz-Carlton hotel.

Five Foundry Tests of Zinc Bronzes, by C. P. Karr.

Influence of Heat Treatment on Gun Metal, by C. F. Smart.

Lead Zinc Bronzes, by H. F. Staley and C. P. Karr.

Manufacture and Electrical Properties of Manganin, by F. E. Bash.

Manufacture and Electrical Properties of Constantan, by F. E. Bash.

Tin Fusible Boiler Plug Manufacture and Testing, by L. J. Gurevich and J. S. Hromatko.

Simplification of Inverse-rate Method for Thermal Analysis, by P. D. Merica.

11:00 A. M.—Automobile trip for the ladies through Fairmount park to Valley Forge, where luncheon will be served.

2:00 P. M.—Golf tournament, Whitemarsh Valley Golf club.

8:00 P. M.—Theater party for ladies and gentlemen at Keith's.

Thursday, Oct. 2

10:00 A. M.—Professional session, Institute of Metals Division, Ritz-Carlton hotel.

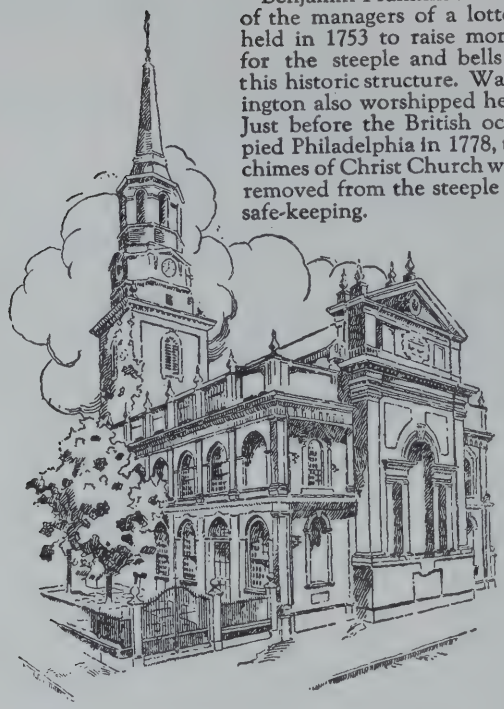
Constitution and Metallography of Aluminum and Its Light Alloys with Copper and with Magnesium, by P. D. Merica, R. G. Waltenberg and J. R. Freeman Jr.

Heat Treatment and Constitution of Duralumin, by P. D. Merica, R. G. Waltenberg and H. Scott.

Heat Treatment of Aluminum Alloy Castings, by Zay Jeffries and W. A. Gibson.

Mechanical Properties and Resistance to Corrosion of Rolled Light Alloys of Aluminum and Magnesium with Copper, with Nickel and with Manganese, by P. D. Merica, R. G. Waltenberg and A. N. Finn.

Deterioration of Nickel Spark-plug Terminals in Service, by H. S. Rawdon and A. I. Krynitzky.



Grain Growth in Alpha Brass, by F. G. Smith.

1:30 P. M.—For the ladies, a visit to Wanamaker's store, plant of the Curtis Publishing Co., Independence hall, and other points of interest in Philadelphia.

7:00 p. m.—Annual banquet, Bellevue-Stratford hotel, followed by dancing.

Old Christ Church

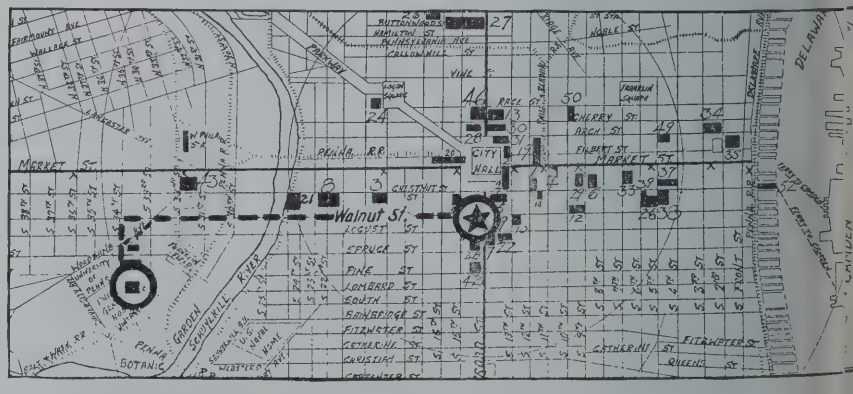
Benjamin Franklin was one of the managers of a lottery held in 1753 to raise money for the steeple and bells of this historic structure. Washington also worshipped here. Just before the British occupied Philadelphia in 1778, the chimes of Christ Church were removed from the steeple for safe-keeping.

leable-iron bars in copper-oxide packing.

It is expected that an unusual amount of interest will be attracted by the session devoted to industrial relations to be held in the Red room of the Bellevue-Stratford hotel Thursday morning. The training of men for foundry work will receive considerable attention, the subject being introduced in papers to be presented by C. C. Schoen and J. C. Wright, who have had experience in dealing with this problem as members of federal boards of investigation. C. D. Dyer, Jr., will present a paper on personnel problems of modern industry and John Calder will discuss the role of the foreman in the plan of industrial democracy. The report of the committee on safety, sanitation and fire prevention will be submitted by Victor T. Noonan, chairman of that committee and a paper entitled "Safety Appliances and Welfare Work in Foundries" will be presented.

Two of the 15 technical papers on the program of the Institute of Metals division are scheduled for the opening professional session to be held at 2:30 p. m. Tuesday in the Ritz-Carlton hotel. David H. Browne and J. F. Thompson will present a paper on the properties of nickel. "Some Properties of and Applications of Rolled Zinc Strip and Drawn Zinc Rod" is the title of a paper prepared by C. H. Mathewson, C. S. Trewin and W. H. Finkeldey. At Wednesday morning's session C. P. Karr and H. F. Staley will present two papers dealing with zinc bronzes and the manufacture and electrical properties of manganin and constantin will be discussed in two papers by F. E. Bash. The subject in four of the six papers scheduled for the Thursday morning session. The other papers to be presented at this session deal with the deterioration of nickel spark-plug terminals and the grain growth in alpha brass.

The Inter-Allied Foundrymen's exhibition to be held in the Philadelphia Commercial Museum will far surpass anything ever attempted by any organization in the United States. The 60,000 square feet of floor space available in this hall, although 43 per cent in excess of any previous exhibit, has proved inadequate for the requirement of the manufacturers desiring to display equipment. In view of the extraordinary demands for space, the manager of exhibits was obliged to restrict the amount of space alloted to each exhibitor. On Sept. 8, three weeks before the opening of the convention, more than 200 manufacturers of foundry, machine shop and metal working equipment had signed contracts for space in the building. The 1919 exhibition will be different in many respects from those of the past five years. Many manufacturers of foundry equipment who, because of the pressure of war, were not able to participate in recent exhibits, will be represented at this year's show. More than 80 exhibitors who were not represented at Milwaukee last year will display equipment at Philadelphia. This year's show will be marked by an unusually large number of working exhibits, especially those consisting of machine tools and molding machines.



In recognition of and to commemorate the convention, the International Shipbuilding Corp. has arranged to launch a ship at the Hog Island yard on Tuesday afternoon, Sept. 30. This ship will be named AFOUNDRIA in honor of the American Foundrymen's association and the great industry which this organization represents. The AFOUNDRIA will be christened by Mrs. A. O. Backert, wife of the president of the association. The launching of the AFOUNDRIA will be one of the features of the boat ride on the Delaware river. The boat will leave the Chestnut street wharf at 1:30 p. m. The name of the ship AFOUNDRIA was coined from the first letters of the name of the association, namely, A. F. A. and the word "foundry."

Wednesday morning promptly at 11 o'clock the ladies will be taken on an automobile trip through Fairmount park to Valley Forge where luncheon will be served. A golf tournament will be held Wednesday afternoon at the Whitemarsh Valley Golf club and at 8:15 p. m. a theater party will be given for ladies and gentlemen at Keith's. Thursday afternoon the ladies will be given an opportunity to visit Wanamaker's store, the plant of the Curtis Publishing Co., Independence hall, and other points of interest in the city.

Speakers from both sides of the Atlantic will appear at the annual banquet which will be held at the Bellevue-Stratford hotel Tuesday evening, Oct. 2. The program includes Hon. James M. Beck, one of the foremost orators in the country, and Sir Ellis W. Hume-Williams, a distinguished citizen of Great Britain. Dancing will follow the banquet.

Special arrangements will be made during the week for visiting foundrymen who desire to inspect industrial plants in Philadelphia and vicinity.

How to Find Your Way in T

The Bellevue-Stratford and Ritz-Carlton hotels, where the A. F. A. and Institute of Metals di will hold their meetings are situated on opposite sides of Broad street at the intersection of Walnut e This is shown on the map by the star within a circle. The Philadelphia Commercial Museum, h

1919 Show Will Surpass All Previous Exhibitions

The Exhibition opens Monday, Sept. 29, at 10:00 a. m. It is Open Daily from 9:00 a. m. to 5:00 p. m. until 5:00 p. m. Friday, Oct. 3. The Floor Space Devoted to Exhibits is 60,000 Square Feet. Many New Exhibitors Have Reserved Space.

ABRASIVE CO., Philadelphia.—This company will exhibit abrasive wheels, bricks and sticks. Grinding wheels of a carbide of silicon abrasive and wheels of an aluminous abrasive will be shown. Basic materials of interest to foundrymen will be exhibited; represented by J. H. Byers and R. R. Stagmer.

ACHESON GRAPHITE CO., Niagara Falls, N. Y.—This exhibit will consist of threaded electric furnace products including skimmers' and cutting and welding electrodes; represented by Acheson Smith, Lyman C. Judson and Atwood Boatman.

AIR REDUCTION SALES CO., New York.—A complete line of welding and cutting apparatus, including oxygen and acetylene, and acetylene generators, will be exhibited; represented by E. L. Mills, A. S. Kinsey, E. M. Sexton, L. A. Sholes, A. R. Ludlow, A. D. Frost, W. P. Roberts, H. F. Weldin, D. Sinclair, B. N. Law and G. Walker.

AJAX METAL CO., Philalelphia.—This company will exhibit an Ajax-Wyatt electric furnace and a group of yellow brass ingots made in this furnace. The ingots have a depression on each side so that tongs will grip them securely. A series of ingots made to different formulas and a variety of castings made from similar ingots will be displayed. Babbitt metals of all kinds will be shown; represented by G. H. Clamer, Frank M. Willeson, A. MacDougall, Louis E. Purnell, John G. Miller, J. M. Graham, S. E. McClure, J. C. Brightbill, C. E. Hopkins, James R. Wyatt and William J. Coane.

AMERICAN GUM PRODUCTS CO., New York.—Cores made with the binder manufactured by this company and castings produced by the use of these cores will be exhibited; represented by Gordon I. Lindsay, W. Edward Baird, M. F. Coughlin, C. F. Witters and F. B. Thomas.

AMERICAN KRON SCALE CO., New York.—The automatic springless dial scale for foundries made by this company will be demonstrated; represented by G. H. Harper, Arnold Peterson and J. J. Kelly.

AMERICAN MANGANESE BRONZE CO., Phiadelphia—A 100,000-pound capacity electrically driven Olsen testing machine will be shown in operation. Exhibitors are invited to bring test pieces to have them tested free of charge. The company also will exhibit manganese bronze ingots and intricate castings made from these ingots; represented by C. R. Spare, T. H. Addie, C. E. Schley and C. J. Bower.

AMERICAN OIL & SUPPLY CO., Newark, N. J.—Cores made with the core oil manufactured by this company will be exhibited; represented by E. F. Hoffmann, W. H. Fitzpatrick and A. E. Jones.

AMERICAN TOOL WORKS CO., Cincinnati.—Three radial drills, a shaper, two lathes and a planer will be exhibited. (See Vandyck Churchill Co.); represented by J. C. Hussey, Robert S. Alter, H. W. Schatz, F. L. Stubenroth and C. R. Connors.

AMERICAN WOOD WORKING MACHINERY CO., Rochester, N. Y.—Wood working machines for pattern making will be exhibited; represented by R. T. Martin.

ARCADE MFG. CO., Freeport, Ill.—Various types of the molding machines manufactured by this company, including the hand-operated pattern, the air-operated and the jolt machines will be exhibited. The company will also exhibit one type of air squeezer, a combined jolt and squeezer and four different sizes of core jolters, a jarring machine and a pouring device; represented by E. H. Morgan, Charles Morgan, L. L. Munn, Henry Tscherning, R. E. Turnbull, August Christen, G. D. Wolfley and Mentor Wheat.

ARMSTRONG CORK & INSULATION CO., Pittsburgh.—Insulating materials, including insulating brick for furnaces, core ovens, boiler settings and other high temperature equipment; covering for steam lines, feed water heaters, tank, etc.; cork covering for refrigerated drinking water systems in mills, factories and industrial establishments; corkboard insulation for cold storage and constant temperature rooms, and tile for floors in offices, residences, etc., will be exhibited.

ARROW FORGING & TOOL WORKS, Chicago.—Chisels particularly designed for cleaning castings and various tools used in shipyards and machine shops will be displayed; represented by L. G. Groessl, Benedict, and H. E. Pollard.

ASBURY GRAPHITE WORKS, Asbury, N. J.—The booth occupied by this company will be fitted up as a rest room. Samples of refined graphites and crude graphite from various localities and countries, will be shown; represented by H. M. Riddle Sr., H. M. Riddle Jr. and E. H. Thompson.

ATKINS, E. C., & CO., Indianapolis.—Metal cutting band saw machines, hack saw blades, hack saw frames, metal cutting circular saws and pattern plates will be exhibited; represented by T. H. Endicott, C. F. Neth, Edward Norvel and T. A. Carroll.

AUDUBON WIRE CLOTH CO., Audubon, N. J.—This company proposes to illustrate in detail the construction of foundry riddles, various grades of wire cloth for foundry use, screening and other wire products; represented by Robert T. Korb, William H. Egee and John D. Heins.

AUSTIN CO., Cleveland.—This company will exhibit models, drawings, photographs and literature on standard buildings. Information regarding foundry and steel plant service afforded by this company will be available. The models of buildings will be large enough to show the method of construction, relative sizes and arrangement of foundry equipment; represented by Benton Hopkins, G. A. Dodge, L. D. Stauffer, J. C. Childs, W. L. Bailey and O. D. Conover.

BARRETT CO., Chicago.—Core compounds and facings will be exhibited. The booth will be fitted up as a rest room; represented by W. M. Wilson.

BARTLEY, JONATHAN, CRUCIBLE CO., Trenton, N. J.—The booth occupied by this company will be fitted up as a rest room to which foundrymen are invited; represented by S. H. Dougherty, James W. Tighe, F. P. Welton, Lee T. Ward, M. H. Fike and Lewis H. Lawton Jr.

BERKSHIRE MFG. CO., Cleveland.—Squeezer molding machines of the air and hand operated types, vibrators, snap flasks and pattern equipment will be exhibited by this company; represented by W. D. Fraser and G. L. Cannon.

BESLY, CHAS. H., & CO., Chicago.—Disc and ring wheel, single and double spindle grinders will be demonstrated. A vertical spindle grinder, particularly adapted for foundry work for grinding flasks, will be shown. A patternmaker's disc grinder also will be exhibited under power; represented by E. P. Welles and C. A. Knill.

BIRKENSTEIN, S., & SONS, Chicago.—This company will exhibit nonferrous metals including ingot brass, ingot bronze, ingot copper, pig tin, pig lead, aluminum, manganese bronze, solder, babbitt, phosphor copper and phosphor tin. Castings made from these products also will be shown; represented by H. Birkenstein, C. Raphael, M. Isaacson, E. Schwab, M. Strauss, N. A. Goldman, N. W. Slohm, H. Gildstine, C. Shamroth, J. W. Long, M. Schero and L. Kahan.

BLACK DIAMOND SAW & MACHINE CO., Natick, Mass.—A combined band saw filing and setting machine for setting and filing both wood and metal cutting band saws; a circular saw filing machine; a beveled tooth circular filing machine for wood-cutting circular saws; a brazing outfit for brazing narrow band saws, both wood and metals, and a special metal cutting band saw for sawing brass, bronze and aluminum, will be shown; represented by Walter B. Ambler, Edward Gordon and Strand and Anderson.

BLYSTONE MFG. CO., Cambridge Springs, Pa.—A 7-cubic foot motor driven core sand mixer equipped with a revolving screen will be shown in operation; represented by Luther G. Conroe.

BOOTH-HALL CO., Chicago.—Electric furnace

BORGNER, CYRUS, CO., Philadelphia.—Samples of refractories for use in foundries will be exhibited; represented by George H. Dickel Jr.

BRASS WORLD PUBLISHING CO., New York.—The booth occupied by this company will be fitted out as a rest room; represented by G. A. Tanner, C. N. Manfred, William F. Carns, George A. Jones, C. H. E. Redding.

BROWN INSTRUMENT CO., Philadelphia.—This company will exhibit a complete line of pyrometers, recording thermometers, recording pressure gages, recording tachometers, draft gages, etc. An attempt will be made in this exhibit to show by demonstration the necessity of giving considerable study to the question of core drying; represented by J. P. Goheen, C. C. McDermott, L. M. Morley, J. L. Hacker and A. H. Edwards.

BROWNING, VICTOR R., & CO., Cleveland.—Two half-ton electric hoists of the type developed by this

company will be exhibited; represented by Sheldon M. Hird, C. R. Rudinger and Harry H. Green.

BUCH FOUNDRY EQUIPMENT CO., York, Pa.—This company will exhibit corrugated steel molding flasks, aluminum flasks, pattern frames, adjustable jackets, adjustable steel bars and electrically and air operated jar, squeeze, rollover and pattern draw molding machines; represented by R. S. Buch and D. C. Coble.

BULLARD MACHINE TOOL CO., Bridgeport, Conn.—This company will exhibit an 8-inch automatic multiple vertical boring mill in operation; represented by S. H. Bullard, F. B. Smith, J. W. Bray, John Beirne, Frank E. Hatch Jr. and J. H. Van Yorx.

CARBORUNDUM CO., Niagara Falls, N. Y.—Departing somewhat from its usual exhibit, the company this year will feature refractories. A Gilbert & Parker furnace equipped with an entire lining of carborundum refractory material will be operated during the convention. Seven different refractory cements and other forms of refractories, including brick will be exhibited and demonstrated. As usual, abrasive materials for use in foundries will be shown; represented by C. E. Hawke, H. E. Kerwin, O. C. Dobson, W. L. Meek, H. G. Kretchmar and G. T. Estabrook.

CHAMPION FOUNDRY & MACHINE CO., Chicago.—A 16-inch jolt rollover molding machine fitted with a pattern and operated as a molding machine, and a similar machine fitted with a core box and operated as a core machine will be exhibited. An electrically operated sand riddle will also be shown in operation; represented by T. J. Magnuson, H. O. Magnuson and A. Magnuson.

CHASE, FRANK, D., Inc., Chicago.—This exhibit will consist of photographs and descriptions of foundries designed and built by this company; represented by Frank D. Chase, Morris W. Lee, W. H. Lenish, A. A. Wicklahd, C. B. Teter.

CHESAPEAKE IRON WORKS, Baltimore, Md.—The exhibit will show the features of the electric traveling crane manufactured by this company and illustrate the character of the great variety of steel structures and bridges that it has built and erected in the United States.

CHICAGO PNEUMATIC TOOL CO., Chicago.—A 14 x 9 x 14-inch air compressor will be operated by this company. It also will exhibit chipping and riveting hammers of all sizes, air and electric drills, pneumatic and electric grinders, sand rammers for bench and floor work, pneumatic geared and cylinder hoists, air hose, hose couplings, and miscellaneous accessories; represented by W. P. Pressinger, A. C. Andresen, A. M. Brown, Nelson B. Gatch, R. F. Eissler, T. G. Smallwood, Ross Watson and T. G. Slingman.

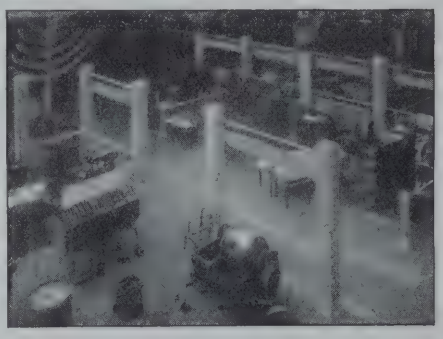
CINCINNATI PULLEY MACHINERY CO., Cincinnati.—Representative sizes and styles of drilling machines manufactured by this company, including machines particularly designed for speeds as high as 12,000 revolutions per minute will be exhibited. Three sizes of sensitive machines, an automatic drilling machine, and machines equipped with built-in tapping attachments will also be shown; represented by J. G. Hey, J. F. Mirrielees and D. A. Patterson.

CLARK, CHARLES J., Chicago.—Blast volume meters and other instruments will be exhibited; represented by Charles J. Clark.

CLEVELAND OSBORN MFG. CO., Cleveland.—Molding machines will be exhibited, including direct draw roll over jolt machines, combination jolt stripper squeezer machines, plain air squeezers, combination jolt squeezers, hand roll over machines and core jolt machines; represented by J. C. Alberts, H. R. Atwater, E. J. Byerlein, E. T. Doddridge, H. E. Deakins, R. E. Kiefer, E. W. Jacobi and F. T. Spikerman.

CLEVELAND PNEUMATIC TOOL CO., Cleveland.—Pneumatic tools and accessories including riveting and chipping hammers; air drills; foundry rammers in two sizes, for floor bench and core work; portable emery grinders in two sizes for use in steel, gray iron and aluminum work; air hose couplings in sizes from ¼ to 1¼-inch; pressure seated air valves, and air hose fittings will be exhibited. The foundry tools will be in operation during the convention; represented by H. S. Covey, Arthur Scott, H. C. Newton, Charles Garner, G. Gregory, F. E. Schwarze and Capt. Frank H. Burr.

CLIPPER BELT LACER CO., Grand Rapids, Mich.—Belt lacers, belt hooks, and twisted rawhide and composition pins used with them will be exhibited. The belt lacer which is operated by hand, will be demonstrated; represented by William F. Kall.



COALE, THOS. E., LUMBER CO., Philadelphia.—Pattern lumber including Michigan soft cork white pine and California sugar pine will be exhibited; represented by Thomas E. Coale and A. Warren Anderson.

COLLIERIES SUPPLY & EQUIPMENT CO., Buffalo.

COMBINED SUPPLY & EQUIPMENT CO., Buffalo.—The chaplets and skim gates manufactured by this company will be exhibited; represented by Stephen LeViness Jr. and C. L. Jackson.

COMBUSTION ECONOMY CORP., Chicago.—A new design of powdered coal feeding and burning equipment equipped with an air-tight rotary air gate, a variable speed direct connected gear case with speeds marked to conform with the operation of the air gate, and a powdered coal carburetor will be displayed. This equipment has a maximum capacity of 75 pounds of coal per minute; represented by George Furman and A. J. Grindle.

CORN PRODUCTS REFINING CO., New York.—The making of cores with the core binder manufactured by this company will be demonstrated. A collection of cores made in this manner will be exhibited; represented by S. B. Krantz, J. A. Oates, F. G. Faller Jr., A. H. Kreischer, D. T. McGrory and J. M. Remmes.

A CORNER IN SHOW TWO YEARS AGO

CURTIS PNEUMATIC MACHINERY CO., St. Louis.—This company will have an operating exhibit consisting of an overhead pneumatic crane with air hoist, an electrically driven double cylinder air compressor, a bracketed jib crane, single I-beam trolleys and air hoists. All equipment will be operating under actual foundry and machine shop conditions; represented by Joseph Macksey and C. C. Main.

DAILY IRON TRADE AND METAL MARKET REPORT, Cleveland.—This booth will be fitted up as a rest room for visitors where all are invited to make their headquarters; represented by John A. Penton, A. O. Backert, J. D. Pease, H. Cole Estep, G. O. Hays, E. L. Shaner, H. E. Diller, D. M. Avey, Pat Dwyer, Charles Vickers, J. F. Ahrens, F. V. Cole, H. O. Taylor and Paul R. Fisher.

WANGELIN, WALTER H., & CO., St. Louis.—A calculator by which mixtures of iron may be rapidly figured will be exhibited; represented by Walter H. Wangelin.

DAVENPORT MACHINE & FOUNDRY CO., Davenport, Iowa.—Molding machines, including a combination jolt roll over pattern draw machine; a 30 x 30-inch jolt stripper and a jolt squeezer will be exhibited; represented by J. T. Anderson, A. V. Magnuson, A. Ziebarth, William Hetzel and Carl Falk.

DAVIS-BOURNONVILLE CO., Jersey City, N. J.—Oxyacetylene welding and cutting apparatus, including stationary and portable equipment, acetylene pressure generators, torches, regulators, etc., and recent developments in cutting and welding machines will be exhibited; represented by W. W. Barnes and H. H. Dyar.

DEBEVOISE-ANDERSON CO., New York.—The exhibit will consist of samples of foundry, furnace and crushed coke; coke and charcoal iron; iron ore; iron ore nodules; fluor spar; ganister; limestone, calcite and dolomite; represented by N. Anderson, P. Debevoise, C. K. Sutton, P. Brooks and C. A. Wyatt.

DINGS MAGNETIC SEPARATOR CO., Milwaukee.—Three of the standard foundry type separators made by this company, including a 12 x 18-inch complete pulley separator, and all equipped with motors for self contained drive, will be exhibited; represented by E. S. Hirschberg and R. A. Manegold.

DISSTON, HENRY, & SONS, Philadelphia.—This company will exhibit a large metal cutting machine in operation. Various types of saws for cutting several kinds of metal will be displayed; represented by W. R. Kendall, Joseph Dorrington, R. B. Mackenzie, R. H. Harris and Messrs. Paul, Dorsey and Bean.

DIXON, JOSEPH, CRUCIBLE CO., Jersey City, N. J.—Various sizes of standard crucibles, covers, scorifiers and phosphorizers will be shown; represented by H. C. Sorenson, R. R. Belleville, J. A. Condit, C. A. Shaw, R. H. Brinkerhoff, R. F. Leonard and J. Moses.

ELECTRIC FURNACE CO., Alliance, O.—Castings produced in various foundries by means of the electric furnaces made by this company will be shown. Two moving picture reels of installations, one showing brass melting equipment and another showing heat-treating furnaces, will be displayed in the booth occupied by this company; represented by R. F. Benzinger and D. D. Miller.

ELECTRIC FURNACE CONSTRUCTION CO., Philadelphia.—The booth occupied by this company will be fitted up as a rest room and office, and pamphlets, photographs and possibly samples of steel produced in Greaves-Etchells electric furnaces, may be shown; represented by Frank Hodson, F. W. Brooke, H. H. Twose and Neil Neville.

EMMERT MFG. CO., Waynesboro, Pa.—A drawing instrument, adjustable drawing board equipment and universal bench vises for wood and metal workers will be exhibited. Oscillating and disc sanders, saw filing and setting machine, drill chuck, steel clamps, grinders and bench planer, a band saw, a bench saw and several other wood working tools will be shown; represented by Edward Gordon, H. S. Kuhn, A. G. Blazier, D. C. Kane and J. Lapides.

FEDERAL FOUNDRY SUPPLY CO., Cleveland.—A new molding machine designed by John T. Stoney, superintendent at the Ferro Foundry & Machine Co., Cleveland, will be exhibited. With this machine, it is claimed, that four men can mold at one time. A number of machines, including plain jolts, combination jolt and squeeze and plain squeezer machines and air and electrically operated vibrators and snap flasks will be shown; represented by Ralph Ditty, Ellsworth Kaye, W. J. Smith, John Bayer and H. W. Trevett.

FOREIGN CRUCIBLE CORP., New York.—French graphite crucibles which can be made in any of the standard American sizes for brass and steel melting will be exhibited; represented by R. N. Stevens and L. J. Rebele.

FOUNDRY, THE, Cleveland.—This booth will be fitted up as a rest room for visitors where all are invited to make their headquarters; represented by John A. Penton, A. O. Backert, J. D. Pease, H. Cole Estep, G. O. Hays, E. L. Shaner, H. E. Diller, D. M. Avey, Pat Dwyer, Charles Vickers, J. F. Ahrens, F. V. Cole, H. O. Taylor and Paul R. Fisher.

FOUNDRY APPLIANCE CO., Newark, N. J.—The cope handling device manufactured by this company will be exhibited. This device is an attachment to a squeezer type molding machine which handles the cope and draws the pattern; represented by J. N. Frantz.

FOUNDRY EQUIPMENT CO., Cleveland.—Various types of ovens for cores and molds will be shown; represented by F. A. Coleman and C. A. Barnett.

FOUNDRY MANGANESE CO., Philadelphia.—This exhibit will consist of ground and lump ferromanganese and silicon, and ground chrome ore; represented by Horace Morgan.

GARDNER MACHINE CO., Beloit, Wis.—This company will exhibit new roll grinders, representative

single spindle disc grinders, heavy duty disc grinders and a 53-inch vertical spindle disc grinder; represented by W. B. Leshman, W. L. Townsend, H. C. Steinbuck, A. A. Swinnerton and F. M. Risler.

GENERAL ELECTRIC CO., Schenectady, N. Y.—An arc welding set will be exhibited; also a cupola blower compressor driven by a 30-horsepower motor. The compressor has a capacity of 4500 cubic feet per minute with one pound pressure when operating at 3450 revolutions per minute; represented by J. M. Hollister, B. L. Spain, B. C. Tracy, L. W. Shugg, Edmond Vonseteeg and C. K. West.

GEOMETRIC TOOL CO., New Haven, Conn.—Threading tools with examples of work performed by them will be exhibited at booth of Vandyck-Churchill Co.; represented by C. F. White.

GORDON, ROBERT, INC., Chicago.—A mechanical hot blast heater will be exhibited. This heater has a capacity to circulate 10,000 cubic feet of air per minute at approximately 200 degrees Fahr. The heater will be in operation and a special casing will be designed for this exhibition so that the heater may be opened to show internal construction; represented by T. H. Monaghan, H. H. Engle and R. M. Zimmerman.

GRACETON COKE CO., Graceton, Indiana Co., Pa.—Foundry coke and castings and photographs of castings manufactured by users of the coke made by this company will be exhibited. Views of the plant will be displayed; represented by C. M. Lyngle.

GRAND RAPIDS GRINDING MACHINE CO., Grand Rapids, Mich.—The exhibit will consist of grinding machinery, including two types of universal cutter, reamer and tool grinders; five types of drill grinders, two of which will be operated, and new grinders for castings; represented by Owen Livingston and J. Cekoning.

GREAT WESTERN MFG. CO., Leavenworth, Kans.—Three types of gyratory foundry riddles, and renewable bottom sieves will be shown by this company; represented by F. A. Pickett and George W. Combs.

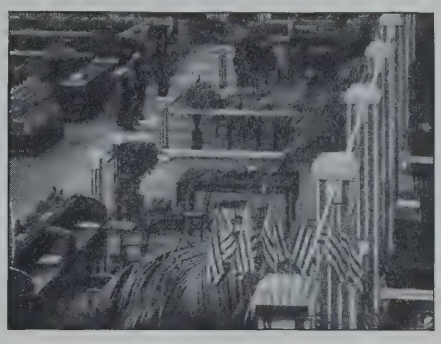
GRIMES MOLDING MACHINE CO., Detroit.—A new model jolt rollover molding machine and a small hand rollover molding machine will be exhibited; represented by George L. Grimes, L. V. Grimes, Charles Skeffington and Oswald Corliss.

HARDY, CLEMENT A., CO., Chicago.—Photographs of plants under construction by this company, including foundries for the Defiance Machine Works and the Hercules Gas Engine Co., will be shown; represented by C. A. Hardy.

HARDY, F. A., & CO., Chicago.—Safety goggles, eye protectors, masks, helmets, etc., will be displayed. The company also will exhibit safety signs, leggings, gloves and hospital apparatus; represented by A. U. Barnes.

HARRIS, BENJAMIN, & CO., Chicago.—Yellow brass and composition ingots and copper bearing materials will be exhibited in the booth occupied by this company; represented by Louis Goldman, Nathan Harris, Oscar Harris, Max Goldman and Dean F. Carscadden.

HAUCK MFG. CO., Brooklyn, N. Y.—This company will exhibit oil burning apparatus for lighting cupolas, heating ladles, drying molds and patching cores; furnaces for melting metals; sand dryers; hand kerosene torches; rivet forges; brazing and blacksmith forges; furnace burners of the low and also high pressure types; preheaters for welding; soldering iron heating furnaces, and salamanders; represented by Arthur E. Hauck, H. H. Kress, A. H. Stein, G. N. Broadhurst, G. T. Shanley, F. E. Giersch and A. M. Thomson.



HAUSFELD CO., Harrison, O.—A noncrucible furnace of the tilting type, a tilting crucible furnace, a stationary crucible furnace, an aluminum melting furnace using a cast iron melting pot, a ladle heater and other foundry equipment for nonferrous metal will be exhibited; represented by E. B. Hausfeld, Joseph Hausfeld and J. S. Armour.

HAYNES STELLITE CO., Kokomo, Ind.—

HAYWARD CO., New York.—An exhibit will be made of working models of clamshell and orangepeel buckets and an electric motor bucket of this type also will be shown in operation. In addition to the foregoing equipment, a collection of photographs illustrating this company's machines in operation in foundries and other industries will be displayed; represented by C. F. Hutchings.

HEALD MACHINE CO., Worcester, Mass.—The types of internal grinders, a 12-inch rotary surface grinder and a cylinder grinder will be exhibited by this company. One of the internal grinders is a new machine which never has been exhibited and which has not been sold. The rotary surface grinder also is new. The cylinder grinder is designed for work which cannot be revolved; represented by S. M. Hershey.

HERBERT, ALFRED, LTD., New York.—British-made machine tools bearing the name of this company will be exhibited for the first time in the United States. All of the machines will be shown in operation. An oscillating tool grinder which produces cutting tools from bar stock by grinding and which, except for special shapes, eliminates the necessity of tool forging, will be shown. A hexagon turret lathe with a capacity of 1⅝ x 27 inches for rapid production of bar work and a combination turret lathe especially adapted for chucking work will be exhibited. Both machines are of the single pulley geared head type. The hexagon turret lathe is equipped with quick power traverse and the turret is rotated by power. A concentric chuck which is adapted for eccentric and irregular work will also be

GLIMPSE OF BOSTON SHOW

shown; represented by Messrs. Blake, Blair, A. Thornton and Albin.

HERMAN PNEUMATIC MACHINE CO., Pittsburgh.—A plain jarring machine, with the table plate off of the base to show the mechanical construction of the machine will be exhibited; represented by Thomas Kaveny, H. T. Frauenheim, Robert F. Ringle, I. J. Oesterling, R. P. Morgan, Robert Porteous, Walter Hughes, C. S. McMath and C. W. Miller.

HIGLEY MACHINE CO., So. Norwalk, Conn.—A motor-driven cold saw will be exhibited in the booth of the Vandyck-Churchill Co.; represented by C. Granger.

HOEVEL MFG. CORP., Jersey City, N. J.—This company will have a working exhibit consisting of a revolving barrel and rotary table sandblast machine; represented by H. F. Hoevel and L. B. Passmore.

HOLCROFT & CO., Detroit.—Photographs, drawings and data on various types of metallurgical furnaces and foundry ovens and also data on special electric furnaces, will be exhibited by this company; represented by Charles T. Holcroft, E. V. Holcroft, W. H. Holcroft, Harry Holcroft and H. L. Ritts.

HYATT ROLLER BEARING CO., New York.—This company will exhibit a large revolving model of roller bearing showing the principles of design and construction; a roller bearing mounted in glass showing the lubrication principles of the bearing; an automatic lantern slide machine showing pictures of roller bearing equipped machinery; and a truck test stand having roller bearing-equipped trucks and plain bearing trucks, demonstrating easy running qualities of the roller bearing equipped trucks; represented by D. Gleisen, P. C. Gunion, M. F. Lawrence, G. O. Helmstaedter, W. L. Iliff, J. M. Hancock and H. L. Littell.

INDUSTRIAL ELECTRIC FURNACE CO., Chicago.—Illustrations of the furnaces made by this company and their applications to various branches of the foundry industry will be shown. A recently developed process of preheating the charge before placing it in the electric furnace, will be described; a new jolt shakeout machine for separating sand from castings and flasks will be illustrated; represented by F. von Schlegell, W. B. Lewis and W. B. Cooley.

INGERSOLL-RAND CO., New York.—Portable pneumatic tools including sand rammers, motor hoists, chipping hammers, riveting hammers, grinders and drills will be exhibited. The sand rammers, motor hoists, grinders and chippers will be in operation; represented by W. A. Johnson, W. B. Brendlinger, P. T. Christy, N. A. Pelham and G. C. Williams.

INTERNATIONAL MACHINE TOOL CO., Indianapolis.—An 18-inch Libby turret lathe working on cast iron gears will be exhibited by this company through its Philadelphia representative, Vandyck-Churchill Co.; the International Machine Tool Co. will be represented by J. A. Villard.

INTERNATIONAL MOLDING MACHINE CO., Chicago.—Molding machines including hand and power turnover machines, jarring machines, squeezers, stripping plate machines and various types of combination machines will be exhibited; represented by Edward A. Pridmore, W. W. Miller, F. W. Hamel and E. G. Borgnis.

INTERSTATE SAND CO., Zanesville, O.—This exhibit will consist of molding sands for iron and steel castings; fire clay; silica washes and ganister; represented by L. K. Brown, E. M. Ayers and O. Tague.

IRON AGE, New York.

IRON TRADE REVIEW, THE, Cleveland.—This booth will be fitted up as a rest room for visitors where all are invited to make their headquarters; represented by John A. Penton, A. O. Backert, J. D. Pease, H. Cole Estep, G. O. Hays, E. L. Shaner, H. E. Diller, D. M. Avey, Pat Dwyer, Charles Vickers, J. F. Ahrens, F. V. Cole, H. O. Taylor and Paul R. Fisher.

JENNISON-WRIGHT CO., Toledo, O.—Samples of the wood blocks manufactured by this company for factory floors will be exhibited and a made-up section of wood block flooring will be displayed. Large photographic reproductions of wood block floors now in service in many well known foundries and machine shops in the United States will be shown; represented by F. E. Jennison and L. P. Drinker.

KELLER PNEUMATIC TOOL CO., Chicago.—A large riveting hammer mounted in a heavy gilt frame and with sections cut out to show all parts moving in the same manner as those in a standard hammer operated by air will be shown. Drills and other tools in operation with portions of the wall removed to show the movement of the parts will be displayed, together with complete models of riveting and chipping hammers, valve and valveless rotary and piston drills, jam riveters, holders-on and sand rammers; represented by W. H. Keller, J. G. Osgood, G. E. McCabe, F. S. Eggleston Jr., W. J. Devlin, C. A. Bremmer, L. B. Smyser, Edward L. Lycett and A. G. Swope.

KELLOGG, SPENCER, & SONS, INC., Buffalo.—Various grades of core oils made by this company and a number of interesting cores produced with these oils and also castings and photographs of large castings produced by the use of cores made with these oils will be on exhibition; represented by V. H. Hunter, U. L. Throm, A. P. Mason, J. N. Yaeger, W. L. Goetz, E. G. Allen and Burt Cox.

KELLY, T. P., & CO., New York.—The booth occupied by this company will be fitted up as a rest room; represented by V. J. Rohe, H. J. Winters, B. H. Forman, H. F. Maurel and W. F. Kaine.

KING, JULIUS, OPTICAL CO., Chicago.—Safety goggles, glass for goggles, and protective helmets, masks, etc., will be exhibited; represented by W. G. King.

KLAXON CO., New York.—This company will demonstrate a code calling device for locating men at any point in a manufacturing plant or foundry. The company also will exhibit industrial horns for signalling purposes and a specially designed telephone which is a loud speaking phone for quick, convenient intercommunication; represented by E. Berg, P. C. Gunion, R. L. Wilkinson and A. W. Hall.

KNOEPPEL & CO., C. E., New York.—Graphic

production control boards designed for controlling the factors effecting foundry operation and production will be exhibited. This system of vizualized control is designed to definitely govern the movement of material, application of labor, the use of equipment and machines, and furnishes records of plant conditions and performances for cost analysis; represented by J. P. Jordan and Irving A. Berndt.

KEMPSMITH MFG. CO., Milwaukee.—A horizontal plain milling machine equipped with single pulley drive, 1¾-inch arbor, two arbor supports, plain vise and necessary accessories will be shown. This machine has 18 feeds and speed changes, the feeds varying from ⅝ to 25 inches per minute. This machine will be exhibited through the Vandyck Churchill Co., Philadelphia. The Kempsmith Mfg. Co. will be represented by Peter Lowe and Mr. Drewes.

LANE, H. M., CO., Detroit.—Photographs and drawings of the engineering work of this company will be shown; represented by H. M. Lane, A. O. Thomas, Benjamin Towlen, Charles R. Seabrook, D. W. F. Nichols, A. O. Thomas, Charles Rochefort.

LEEDS & NORTHRUP CO., The, Philadelphia.—Pyrometer equipment consisting of indicating and recording instruments used in controlling temperatures in the foundry such as core ovens, etc., will be exhibited. An optical pyrometer for reading temperatures of molten metals also will be shown; represented by G. W. Tall Jr., E. B. Estabrook, Oscar Brewer and A. M. Redding.

LIBERTY STEEL PRODUCTS CO., INC., New York.—Two types of a gasoline motor driven industrial tractor and two lift trucks will be exhibited. A model of the type of sectional steel building manufactured by this company will be shown; represented by Charles K. Drury, W. Robbins, T. L. Lawry, S. W. Midgley, W. S. Ottinger Jr. and A. H. Dillon Jr.

LIBERTY SUPPLY CO., Pittsburgh.—

LINCOLN ELECTRIC CO., Cleveland.—This company will exhibit arc-welding apparatus used in foundries. A motor operating under water and several sizes and types of foundry motors will be shown; represented by Robert E. Kinkead, Dorsey C. Anderson, O. P. Lang and P. C. Pipes.

LINDSAY CHAPLET & MFG. CO., Philadelphia.—This exhibit will consist of chaplets ranging in size from those ¼-inch in length used for motor castings to large double head chaplets having ¾ and 1-inch stems and being as long as 6 inches with plates 4 x 4 inches square and ¼-inch thick used in connection with making castings for bed plate castings for gun presses; represented by Stanley B. Wentz, James C. Newlin Jr. and Herman E. Mandel.

LINK BELT CO., Philadelphia.—This company will exhibit a machine which reclaims used molding sand. This machine tempers and mixes the sand and prepares it for further use. An overhead monorail electric hoist equipped with cord operated control designed for handling molds and cores without jarring will be exhibited. A silent chain drive will be in operation; represented by A. G. J. Rapp, F. F. Waechter, James Monroe and L. Spillan.

LOUDEN MACHINERY CO., Fairfield, Iowa.—Overhead tracks and trolleys for use in foundries will be exhibited. Special carriers and containers for metal and various foundry materials will be shown; represented by H. M. Miller, L. E. Gaston, C. S. Doran, H. W. Cuddy and L. E. Berthold.

LUPTON'S, DAVID, SONS' CO., Philadelphia.—Samples of pivoted steel sash, counterbalanced steel sash, power house steel sash, and continuous sash designed for monitor, sawtooth and sidewall construction will be shown. About 10 typical cross-sections of foundries and buildings of similar nature will be shown on a mechanically operated device especially built for this exhibit; represented by Clarke P. Pond, C. F. P. Buckwalter, R. A. Sanborn and H. R. Wilkinson.

McCORMICK, J. S., CO., Pittsburgh.—Included in the foundry equipment exhibited by this company will be a pneumatic blacking mixer operated with outlets for spraying purposes; an electric magnetic separator which will be shown in operation; an embossing machine for use in the pattern shop, and samples of blacking made by this company; represented by J. S. McCormick, T. E. Malone and S. R. Costley.

McCROSKY TOOL CORP., Meadville, Pa.—This exhibit will consist of a complete line of adjustable reamers, quick change chucks and collets for drill press work, turret tool posts for lathes, and universal lamp brackets; represented by C. M. Sutton, C. Harper Halfmann and M. J. Frank.

MACLEAN PUBLISHING CO., LTD., Toronto, Ont.—The booth occupied by this company will be fitted out as a rest room; represented by A. R. Lowe, A. H. Byrne, B. G. Newton and F. H. Bell.

McLAIN'S SYSTEM, INC., Milwaukee.—Samples of semisteel castings of light sections including automobile cylinders containing from 20 to 30 per cent steel; and gears, pistons, projectiles and other samples of semisteel castings containing from 20 to 50 per cent steel will be shown. Open-hearth steel castings poured from metal made in a McLain-Carter oil-fired, open-hearth furnace will be displayed; represented by David McLain, Harry McLain and I. V. Scanlan.

MACLEOD CO., THE, Cincinnati, O.—Two sand blast barrels, a sand blast hose machine and portable oil burners will be exhibited by this company; represented by Harry Rittmeyer.

MAGNETIC MFG. CO., Milwaukee.—Various types of magnetic separators built by this company will be shown in operation. These will include a machine of all-steel construction for reclaiming metal from

A FEW BOOTHS IN 1917

foundry refuse and cupola drop. A magnetic pulley provided with ventilating device will be shown; represented by R. H. Stearns, J. P. Bethke and R. N. Stearns.

MAHR MFG. CO., Minneapolis.—This company will exhibit foundry torches, oil and gas fired rivet forges, ladle driers and ladle heaters; represented by H. H. Warner, W. G. Barstow and R. B. Ecker.

MALLEABLE IRON FITTINGS CO., Branford, Conn.—A number of vibrators manufactured by this company will be operated by compressed air on a specially built frame. A vibrator core bench for making small cores by the multiple system will be shown and girl operator will demonstrate the machine; represented by G. B. Pickop, also H. J. Felsburg of J. Jacob Shannon Co.

MARDEN, ORTH & HASTINGS CORP., New York.—The booth occupied by this company will be fitted up as a reception room. Cores made by the liquid and powdered sand binder manufactured by this company and samples of these materials will be shown; represented by H. M. Handy.

MASON, ARTHUR C., INC., Hawthorne, N. J.—The high speed, quick change sensitive bench drill manufactured by this company will be exhibited; represented by C. A. Widmer, Arthur C. Mason and William Reynolds.

MAXON-PREMIX BURNER CO., Muncie, Ind.—Fuel burners will be exhibited.

MERCURY MFG. CO., Chicago.—

METAL INDUSTRY, New York.—The booth occupied by this company will be fitted out as a rest room; represented by P. H. Langdon, Adolph Bregman, G. W. Cooper, T. A. Trumbour and H. C. Burr.

METAL & THERMIT CORP., New York.—Transparencies and photos showing various applications of thermit for welding and demonstrating the use of thermit for pipes, will be displayed. Heating cans for foundry work and small welds will be exhibited; represented by W. R. Hulbert, A. F. Braid, H. G. Spilsbury, J. G. McCarty and H. D. Kelley.

METALLIC ABRASIVES MANUFACTURERS' ASSOCIATION OF AMERICA, Pittsburgh.—Metallic abrasives for sand blasting will be exhibited; represented by G. H. Kann, Pittsburgh Crushed Steel Co.; N. C. Harrison, Harrison Supply Co.; H. M. Ream, Globe Steel Co.; I. A. Diamondstone, Harrison Bros., Inc., and R. S. Kann, Pittsburgh Crushed Steel Co.

MICHIGAN SMELTING & REFINING CO., Detroit, Mich.—Nonferrous metal products including ingot, brass and bronze, solders, babbitt metals, lead pipe, brazing spelter, etc., will be exhibited; represented by R. H. Evans, Norman Sillman, Maj. F. C. Bahr, Henry Levitt, C. T. Bragg, R. R. Arnold and William W. Eitel.

MIFFLIN CHEMICAL CORP., Philadelphia.—Samples of the core binder made by this company and cores produced by the use of this binder will be exhibited; represented by Phillip Publicker, Harry Cohen and W. J. Lehman.

MILBURN, ALEXANDER, CO., Baltimore.—Oxy-acetylene welding and cutting apparatus, including an acetylene welding generator, combination welding and cutting torches, welding torch operating on equal pressures of oxygen and acetylene, a lead-burning apparatus, portable carbide lights ranging in size from 1000 to 15,000 candlepower and a light and heating burner which uses kerosene oil; represented by A. F. Jenkins.

MINE & SMELTER SUPPLY CO., New York.—A Wiffley table of laboratory size will be shown in operation; represented by E. S. Tompkins.

MONARCH ENGINEERING & MFG. CO., Baltimore.—The following furnaces will be exhibited by this company: Four types of noncrucible furnaces including a double chamber furnace, a vertical furnace and a rotary furnace; a tilting coke-fired furnace with crucible; a tilting oil-fired furnace with crucible; three oil-gas and coke-fired core ovens; a ladle heater and a stationary oil or gas-fired steel furnace; represented by H. D. Harvey, James J. Allen, Frank P. Maujean and William Raber.

MONARCH MACHINERY CO., Philadelphia.—The following machines will be exhibited: A 32-inch shaper; several types of heavy duty and high-speed drill presses, two types of milling machines, and an engine lathe; represented by Edwin R. Mack, Austin H. Campbell, Robert L. Arms, Henry M. Shaw, Andrew J. Berger, A. W. Heppard and E. W. Stegman.

MOTT SAND BLAST CO., New York.—A sand blast barrel will be shown in operation. In addition a late type of cloth screen dust arrester will be operated and a complete line of accessories, such as hose, helmets, nozzles, gloves, etc., will be shown; represented by David Mayer, E. J. Rosenthal, E. C. Gilmour and R. E. Donnelly.

MUMFORD MOLDING MACHINE CO., Chicago.—A new combination jolt split pattern molding machine fitted with automatic, slow-start oil pattern draft cylinder, controlled by a knee valve will be exhibited. This machine is designed to give a smooth, slow start for the first three-quarters of an inch with a rapid finish for the balance of the pattern draw, thereby leaving the operator's hands entirely free to pick up the mold the instant the pattern is drawn; represented by P. W. Gates, James T. Lee, O. F. Weiss and J. O. Clark.

NAPIER SAW WORKS, Springfield, Mass.—A motor-driven horizontal band saw will be shown in operation; hack saws made by this company also will be exhibited; represented by A. C. Whitefield and H. M. Reynolds.

NATIONAL ENGINEERING CO., Chicago.—Three sand mixers varying in size from 3 to 6 feet in diameter will be exhibited. The 6-foot machine will be in operation during the convention and will mix facing sand, core sand and other mixtures; represented by H. S. Simpson.

NICKOLLS, WILLIAM H., CO., New York.—

NEW CHICAGO CRUCIBLE CO., Chicago.—Graphite crucibles manufactured by this company will be exhibited; represented by Dr. Sherman Taylor, Adolph Hottinger, LeRoy C. Taylor, James Foraker, J. W. Mann and John Kroll.

NORMA CO. OF AMERICA, New York.—Ball bearings manufactured by this company for use in frac-

tional horsepower electric motors, high speed grinders, portable electric drills, high speed sensitive drill presses, etc., will be exhibited; represented by Norman Bell, Arthur Meder, D. E. Batesole and George R. Bott.

NORTON CO., Worcester, Mass.—This company will exhibit the following: One 6 x 32-inch plain cylindrical grinding machine; one 2-inch floor stand; one 1¼-inch floor stand; one ¾-inch bench machine, motor driven; one universal tool and cutter grinder; and various grinding wheels for use in the foundry and an exhibit of tool and cutter grinding wheels. Polished stove parts ground by abrasives made by this company also will be shown; represented by S. A. Craig, W. R. Strong, E. F. Anderson, Herbert Duckworth, Wallace T. Montague, E. W. Barnes and C. H. Wood.

OAKLEY MACHINE TOOL CO., Cincinnati.—The universal cutter and tool grinder manufactured by this company, equipped with power feed, wet grinding attachment and motor drive will be operated; represented by Abbot A. Thayer.

OBERMAYER, S., CO., Chicago.—This company will exhibit a sprue cutter, tumbling barrel, ladles, and other small foundry equipment. The use of a furnace cement manufactured by this company will be demonstrated in a small electric furnace; represented by S. T. Johnston, E. D. Frohman, J. L. Cummings, William Fitzpatrick, J. J. McDevitt, W. J. Adams, I. D. Adams, J. E. Evans, O. J. Peterson, O. C. Olson, C. M. Barker and William Fenton.

OHIO BLOWER CO., Cleveland.—This company will exhibit a portable core oven complete, a section of a rack type and truck type oven showing corners and door construction; rotary ball bearing ventilators; air separators, and air traps; represented by David Johnson, George Thomson, Herbert Brandt, Thomas Whitaker, Eugene Van Note and H. A. Bogardus.

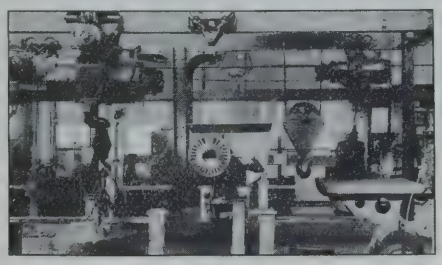
OLDHAM, GEORGE, & SONS CO., Frankford, Philadelphia.—Chipping hammers, foundry rammers and core busters will be exhibited by this company; represented by Messrs. Fraser and Biles.

OLIVER MACHINERY CO., Grand Rapids, Mich.—A complete pattern shop will be operated by this company. All of the following machines will be operated: A universal wood milling machine; a vertical disc and spindle sander; two types of hand planer and jointer; a universal bench saw; a combined band re-saw and scroll saw; a band sawing machine; a pattern maker's lathe; two types of wood trimmers, a revolving oil stone tool grinder; a pattern maker's bench; a type embossing press; a surface planer; an extra heavy duty engine lathe; a tool room engine lathe, and a die filing machine. Complete patterns will be turned out from this shop during the convention; represented by R. F. Baldwin, Arthur Blake, J. Ray Bate, G. C. Conklin, C. R. Crossley, Dolph De Young, C. A. Ginter, J. E. McLauchlen, Arie Steenbergen and A. S. Kurkjian.

OXWELD ACETYLENE CO., Newark, N. J.—This company will exhibit and make practical demonstrations of oxyacetylene cutting and welding apparatus; represented by W. E. Cotter, W. B. Wilson, V. L. Mauhowt, G. R. Mitchell and F. W. Smith.

PANGBORN CORP., Hagerstown, Md.—The exhibit of this company will be more extensive than in previous shows. The equipment, which will be in operation, will include cabinet sand blasting outfits, barrel sand blasts, rotating table cabinet and plain rotating table apparatus, hose machines, sand separators, dust arresters and exhausters. Actual installations made by the Pangborn Corp. will be shown by a stereopticon machine; represented by Thomas W. Pangborn, John C. Pangborn, Harry D. Gates, W. C. Lytle, P. J. Potter, George A. Cooley, Charles T. Bird, Jesse J. Bowen, Roy C. Koch, J. F. Tracey, T. R. Ditty, Hugo F. Liedtke and Foster J. Hull.

PAXSON CO., J. W., Philadelphia.—Products manufactured by this company, including foundry facings, foundry sands, gravels and clays and other supplies and equipment will be exhibited; represented by H. M. Bougher, Howard Evans, S. C. Bougher, H. J Bougher, F. B. Platt, J. S. Hibbs, A. G. Warren, John S. Gilbert and I. F. Kremer.



PENTON PUBLISHING CO., Cleveland.—This booth will be fitted up as a rest room for visitors where all are invited to make their headquarters; represented by John A. Penton, A. O. Backert, J. D. Pease, H. Cole Estep, G. O. Hays, E. L. Shaner, H. E. Diller, D. M. Avey, Pat Dwyer, Charles Vickers, J. F. Ahrens, F. V. Cole, H. O. Taylor and Paul R. Fisher.

PETTINOS, CHARLES E., New York.—Foundry sand suitable for steel, gray, iron, brass, bronze and aluminum castings, plumbago for various uses, and graphite will be shown; represented by Charles E. Pettinos, M. M. Houskeeper, J. H. Bing, Martin Meiss and W. H. Laros.

PETTINOS, GEORGE F., Philadelphia.—The booth occupied by this company will be fitted up as a reception room; represented by George F. Pettinos and H. B. Taylor Jr.

PHILADELPHIA GREASE CO., Philadelphia.—Various grades of the grease made by this company for lubricating all classes of machinery and especially pneumatic tools will be exhibited; represented by Messrs. Dean, Maloney, White and Horace A. Smith.

PICKANDS, BROWN & CO., Chicago.—This company will exhibit by-product coke in conjunction with the Semet-Solvay Co. The front of Independence hall, Philadelphia, will be reproduced in a structure of coke, the top of the tower reaching about 15 feet above the floor. George A. T. Long, whose work with coke has attracted considerable attention at previous shows, will erect this year's exhibit; represented by Thomas W. Glasscot, James A. Galligan,

AT THE CHICAGO EXHIBIT, 1914

James A. Ballard, William H. Ball and George A. T. Long.

PITTSBURGH FURNACE CO., Milwaukee.—Photographs of the electric furnace installed by this company in steel mills and steel castings plants will be displayed; represented by J. F. Dirzuweit and E. V. Kane.

PORTAGE SILICA CO., Youngstown, O.—This company will exhibit photographs of its plant and samples of silica rock in its natural state and of the finished sand produced from it; represented by E. E. Klooz and L. R. Farrell.

PRIDMORE, HENRY E., Chicago.—A number of molding machines, including a plain electric jolt machine, a jolt strip and jolt roll-over machine, a hand roll-over machine and a hand stripping plate machine will be exhibited; represented by Mrs. Henry E. Pridmore, H. A. Pridmore, George Furman, H. G. Schlichter, D. F. Eagan, C. H. Ellis, J. W. Dopp, Hugh Gallagher and Marshall E. Pridmore.

PROVIDENCE GAS CO., Providence, R. I.—This company will exhibit foundry coke; represented by C. H. Tholl, M. B. Beck and W. G. Rich.

QUIGLEY FURNACE SPECIALTIES CO., New York.—A refractory material for bonding fire brick will be demonstrated. Temperature tests on this material will be made by means of electric furnaces and various metallurgical applications of this material will be illustrated. A refractory fire sand for making rammed-in linings, special tile and for repairing furnace structures will also be shown. A powdered coal system for preparing, transporting and burning powdered coal will be featured; represented by W. S. Quigley, J. H. McPadden, L. G. McPhee, H. M. Miller, C. E. Pullum, George R. Powell, C. E. Klein, F. W. Reisman, S. D. Enoch and F. G. Wenzel.

RACINE TOOL & MACHINE CO., Racine, Wis.—Three types of the high-speed metal cutting machines made by this company will be exhibited. The tools exhibited will be of 6 x 6-inch, 8 x 8-inch and 12 x 15-inch capacity respectively. A 6 x 6-inch machine will be operated and a high-speed rail cutting machine will be shown; represented by A. H. Goetz, E. R. Larson, T. A. Hyde, D. B. Maxwell, Ralph Maxwell, N. R. Petersen, F. J. Kidd and William Reinhardt.

RAILWAY MECHANICAL ENGINEER, Chicago.

RAINEY, W. J., Philadelphia.—Samples of Connellsville beehive and rectangular oven foundry coke and photographs of a number of operations producing this grade of fuel will be shown. By-product foundry and furnace coke and photographs showing the erection and operation of a by-product plant at Swedeland, Pa., will be shown; represented by A. F. Kempe, R. I. Willcox, H. B. Prescott and W. H. Vermilya.

REPUBLIC CREOSOTING CO., Indianapolis.—Exhibits of interior wood-block floor installations will be featured; represented by H. G. Stephens and G. Nelson.

RICH FOUNDRY EQUIPMENT CO., Chicago.—(See Sand Mixing Machine Co.)

RICHARDS-WILCOX MFG. CO., Aurora, Ill.—This company will exhibit overhead carrying systems including trolley and I-beam types of monorail tracks with switches, cross-overs, turntables, trolleys, etc. A traveling crane and hoists will be shown; represented by A. J. Eggleston and E. J. G. Phillips.

ROBESON PROCESS CO., New York.—Cores bound with the core binder manufactured by this company will be exhibited; represented by G. I. Lindsay, C. A. Rapallo, T. J. Ryan and T. J. O'Hara.

ROGERS, BROWN & CO., Cincinnati.—This company will exhibit samples of foundry coke, alloys, pig iron and fluor spar. Finished iron castings of intricate design produced from these materials will be shown and in addition, a 12-cylinder Liberty motor loaned through the courtesy of the Lincoln Motor Co., Detroit, and especially constructed by it as a permanent exhibit at the Smithsonian institute, Wash., will be exhibited; represented by S. W. Hubbard, T. A. Wilson, A. O. Sonne, H. W. Fernald, F. E. Fitts, R. W. Clark, J. A. Claussen, George R. Sullivan, Richard Peters Jr., S. B. Morrison, H. B. Carson, F. J. Waldo, A. F. Stengle, F. W. Bauer, A. J. Wentworth and J. R. Morehead.

ROOTS CO., P. H., & F. M., Connerswille, Ind.—A number of the smaller blowers manufactured by this company will be exhibited, including the first blower ever constructed by the P. H. and F. M. Roots Bros., 60 years ago; represented by E. D. Johnston and H. M. Papworth.

SAND MIXING MACHINE CO., New York.—This company will exhibit the following products of the Sand Mixing Machine Co., the American Foundry Equipment Co. and the Rich Foundry Equipment Co., which recently were combined and now operate under the name of the American Foundry Equipment Co.: An auto sand cutter designed to cut, mix and pile sand on molding floors a rotary sand blast table room; a gravity feed barrel; an annealing oven truck, and a core making machine; represented by V. E. Minich, Elmer A. Rich Jr., Hutton H. Haley, John D. Alexander, Charles G. Smith, Jerome E. Sweet and C. B. Schneible.

SELLERS, WM., & CO., INC., Philadelphia.—This company will exhibit a centrifugal sand mixing machine, belt and motor driven; a motor-driven universal tool grinding and shaping machine, and a motor-driven twist drill grinding machine; represented by Edward L. Holljes, Charles T. Wilson and Stephen A. Smith.

SHEPARD ELECTRIC CRANE & HOIST CO., Montour Falls, N. Y.—This company will erect a special structure of which various types of hoisting equipment will be exhibited. Among the types of hoisting apparatus shown will be a standard crane trolley operated by controllers from the floor; a cage operated hoist with an electric magnet; two standard types of floor operated hoists and a new type of electric cargo winch. This winch, which will be shown in operation, consists of a cast base upon which is mounted a back geared motor with a special drum and winch head. The head is so arranged that it works independently of the drum, so that the load may be held stationary at any point by means of ratchet and pawl while the boom is either raised or lowered or swung around by the winch

head. The power is furnished through a standard slow speed crane motor and a double gear train of internal gears; represented by W. C. Briggs, R. W. Hurst, F. E. Meeks, R. J. Wadd, N. P. Farrar, D. B. Patterson, H. W. Gledhill, John Jackson, W. C. Minier, G. N. French, Walter B. Briggs, R. H. McGredy, A. J. Barnes and John Guyer.

SIMONDS MFG. CO., Fitchburg, Mass.—Saws for cutting various kinds of metal will be exhibited and a metal saw sharpening machine will be demonstrated; represented by H. B. McDonald and Spencer Patterson.

SKINNER BROS. MFG. CO., St. Louis.—A motor-driven 4 x 4-foot heater for heating foundries and industrial plants will be shown in operation. Represented by E. C. Evans, C. V. Haynes, Mr. Sewell.

SLY, W. W., MFG. CO., Cleveland.—This company will exhibit the following: A sand blast mill; a turntable cabinet complete with sand and dust elevating and separating system; a hand sand blast cabinet; a sand blast cage; a tumbling mill; a resin mill; a sand blast pressure tank, and photographs and sand blast test plates; represented by W. C. Sly, George J. Fanner, E. J. Moore, P. W. Graue, D. E. Hadley and S. H. Baird.

SMITH, R. P., & SONS, Chicago.—Safety shoes for molders and foundrymen will be exhibited; represented by J. B. Smith Jr.

SMITH, WERNER G., CO., Cleveland.—Samples of the core oils made by this company will be displayed along with specimens of cores and castings made from these products; represented by Werner G. Smith, Frank H. Dodge, L. P. Robinson, M. S. Finley, W. E. Rayel, F. K. Sawyer, J. C. DeVenne and L. F. Ferster.

SPENCER TURBINE CO., Hartford, Conn.—A 15-horsepower turbine compressor for use in supplying air for cupolas will be exhibited; represented by H. M. Grossman and S. E. Phillips.

STANDARD SAND & MACHINE CO., Cleveland.—This exhibit will consist of a motor-driven sand mixer; represented by Harry E. Boughton.

STANDARD SHOP EQUIPMENT CO., INC., Philadelphia.—Standard methods and standard equipment for properly setting up work on machine tools will be displayed. The following appliances will be shown: T-head steel slot bolts, double and single end clamps, packing and step blocks, nuts and washers, bolt spacers and drop forge wedgers; represented by H. J. Stites and M. M. Sarben.

STERLING WHEELBARROW CO., Milwaukee.—Foundry flasks, wheelbarrows, core barrows, etc., will be exhibited. A feature of the exhibit of this company will be samples of very large flasks, complete with intricate bars; represented by I. R. Smith, H. H. Baker, A. E. Welch, J. J. Coyne, H. Kalthoff, R. F. Jordan, George H. Lambkin, Charles L. Kirk, J. W. Dopp and J. M. Patterson.

STRAUSS & BUEGELEISEN, New York.—This exhibit will consist of laminated glass manufactured by this company, welding goggles and goggles for all hazardous operations in the foundries; represented by M. Walter, L. V. Siegel, D. and J. Buegeleisen.

SULLIVAN MACHINERY CO., Chicago.—This company will operate a 14 x 8¾ x 10-inch angle compound belt-driven air compressor at 50 revolutions per minute with a displacement of 445 cubic feet of air per minute. The machine will be driven by a 75-horsepower General Electric motor, and will compress air for other exhibitors at the show. A 10 x 10-inch straight line single-stage belt-driven compressor equipped with a new design of plate valve, also will be exhibited; represented by Arthur E. Blackwood, J. B. Pratt and Alexander Milne.

SWAN & FINCH CO., New York.—Cores in which the core oil manufactured by this company has been used will be exhibited; represented by Richard Thackray, Edward F. Ryan, Mr. Chamberlin, C. G. Howe, C. B. Lamson, T. P. James, George J. Graham, J. A. Ellis and H. J. Waldron.

SWIND MACHINERY CO., Philadelphia.—This company will exhibit an 18-inch x 8-foot geared head lathe; a heavy-duty drill; a sheet metal cutter and an internal grinding machine. All of these machines are motor driven; represented by L. H. Swind, J. E. Brandt, W. J. Powers, M. R. Carson and D. M. McCracken.

TABOR MFG. CO., Philadelphia.—The exhibit will include plain power squeezer, combination jarring squeezer, power squeezing split pattern, jarring squeezing split pattern, plain jarring machine, jarring and roll over, hand ramming roll over, and jarring stripping plate types of molding machines. A saw and milling cutter also will be exhibited; represented by Wilfred Lewis, H. W. Brown, J. T. Ramsden, J. H. Coleman, H. W. Impey, W. E. Sewell, D. J. Martin, John Fendner, E. S. Lewis, Jacob Degler, Philip Shire and T. L. Sumner.

THOMAS ELEVATOR CO., Chicago.—Wrenchless chucks and drill press vises will be operated; represented by Messrs. Moorse, Cassell and Bolduck.

THOMAS IRON CO., Hokendauqua, Pa.—Samples of pig iron, ore and castings in which these materials have been used will be exhibited; represented by Philip E. Wright.

THOMPSON, LEWIS, & CO., INC., Philadelphia.—Several patterns made from mahogany many years ago will be shown by this company to demonstrate the quality of this wood; represented by Charles H. Thompson Jr. and L. P. Bransford Jr.

TRUSCON STEEL CO., Youngstown, O.—The exhibit will consist of pressed steel foundry flasks; a pressed steel platform for lift trucks; photographs and layouts of various types of industrial buildings, and side wall steel windows, top hinge continuous monitor steel sash and a tension operating device; represented by G. F. Danielson, G. F. Bateson, C. I. Anten, H. W. Jencks, G. F. Sparks and C. W. Close.

UNITED COMPOUND CO., Buffalo.—Vent wax and pattern wax will be exhibited; represented by John W. Bradley and L. F. Leney.

UNITED STATES GRAPHITE CO., Saginaw, Mich.—The booth occupied by this company will be fitted up as a rest room. Graphite and graphite products will be displayed; represented by R. A. Corrigan, J. G. Drought, F. B. Godard, H. F. Gump and G. D. Robinson.

U. S. MOLDING MACHINE CO., Cleveland.—The following machines will be exhibited: A plain air squeeze machine; combination jolt and squeeze machine; a combination jolt squeeze pattern draw machine; combination jolt squeeze stripping plate machine; a combination jolt stripping machine; a jolt roll over core machine, and a plain air jolt machine. These machines will be shown in operation; represented by J. N. Battenfeld, J. L. Battenfeld, C. F. Battenfeld and J. L. Murdock.

UNITED STATES SILICA CO., Chicago.—Samples of an abrasive for sand blasting and a form of silica for steel molding and core making; also samples of castings produced by these materials will be exhibited; represented by Volney Foster, Lewis B. Reed, H. F. Goebig and Oliver Cook.

VANDYCK-CHURCHILL CO., Philadelphia.—This company will exhibit a 3-foot sensitive radial drill with tapping attachment arranged for belt drive; a 5-foot triple purpose, plain arm, high duty radial drill equipped with speed-box and arranged for belt drive; a 3-foot triple purpose, high speed radial drill, motor driven; a 24-inch shaper, motor driven; a 16-inch tool room lathe, with complete equipment, belt driven; a 20-inch x 10-foot lathe, motor driven; a 30-inch x 30 x 8-foot planer, belt driven. These tools are manufactured by the American Tool Works Co., Cincinnati. The Vandyck company also will exhibit a motor-driven multiple milling machine made by the Kempsmith Mfg. Co., Milwaukee; a 16-18-inch motor-driven turret lathe, manufactured by the International Machine Tool Co., Indianapolis; a motor-driven universal grinder made by the Oakley Machine Tool Co., Cincinnati; a motor-driven cold saw manufactured by the Higley Machine Co., South Norwalk, Conn.; an exhibit of geometric threading tools manufactured by Geometric Tool Co., New Haven, Conn. As far as possible, the machines will be demonstrated on work; represented by C. M. Hamersly, Charles F. White, A. C. L. Black, J. K. Robson, George Crawshaw.

VIBRATING MACHINERY CO., Chicago.—This company will exhibit an electrically operated sand sifter and a gas unit for welding and cutting iron and steel with artificial or natural gas; represented by J. Schroeter, J. C. Miller and William Lindsay.

WILSON, T. A., & CO., Reading, Pa.—The booth occupied by this company will be equipped as a rest room for foundrymen. Safety goggles will be displayed; represented by M. C. Rider, E. A. Wagner, G. D. Richardson and N. Roy Miller.

WADSWORTH & CO., Cleveland.—Working models of tractor, crane and screen types of the new sand cutting machine being built by this company will be exhibited; represented by H. L. Wadsworth, George W. Beyerle and John L. Lake.

WADSWORTH CORE MACHINE & EQUIPMENT CO., Akron, O.—This company will exhibit a bushing core making machine; two motor-driven core cutting off and coning machines and steel reinforced core trays and bottom plates; represented by George H. Wadsworth and M. C. Sammons.

WALLACE, J. D., & CO., Chicago.—Woodworking machines including planers and complete equipment for a modern pattern shop will be shown; represented by J. D. Wallace and H. L. Ramsey.

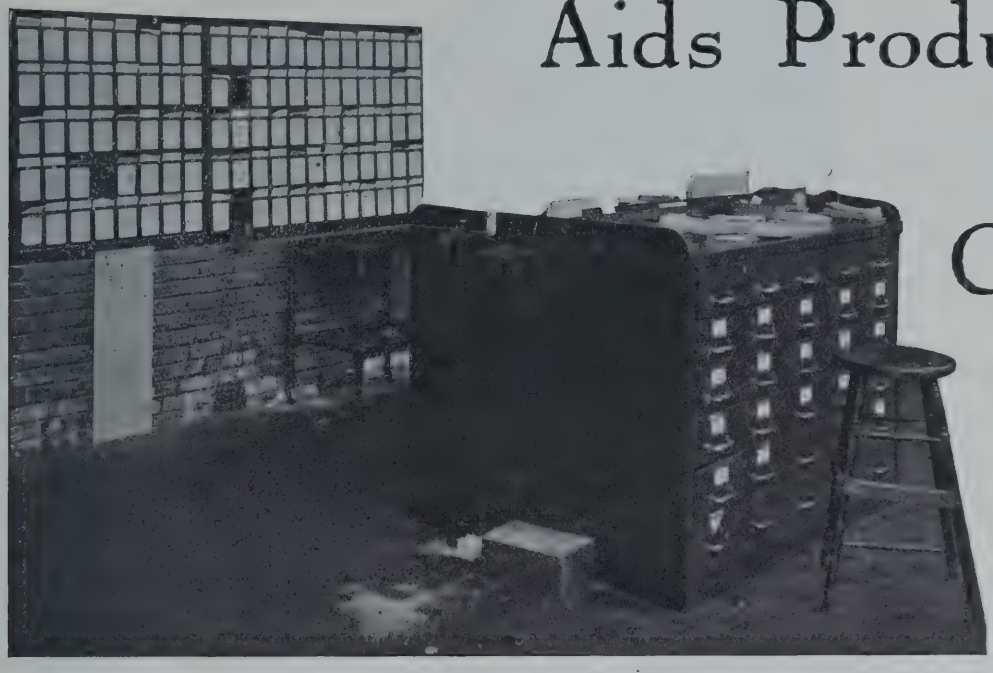
WARNER & SWASEY CO., Cleveland.—This exhibit will consist of a universal hollow hexagon turret lathe operating on gear blanks and a universal screw machine operating on a special design of screw; represented by L. K. Berry, E. R. Gardner, H. E. Yeager and W. L. Loegler.

WESTINGHOUSE ELECTRIC & MFG. CO., East Pittsburgh, Pa.—Electrical equipment for foundries and machine shops, including steel-clad electrical heating devices for heating pattern plates, will be exhibited. The heaters are mounted in the space below the plates within the framework of the molding machine. A 500-ampere arc-welding motor generator set, with control panel and accessories, also will be exhibited. Industrial motors, starters and controllers, meters, fans, etc., will be displayed.

WHITE & BRO., INC., Philadelphia.—Nonferrous metals of all kinds including casting copper, electrolytic copper, composition and bronze ingots, yellow brass ingots, manganese bronze, babbitt metals and other white metals; represented by Frank Krug, Raymond Hunter, Gillis Arsenault, G. Horace Krider, J. C. Ashmeads, F. A. Reinhardt, Harold F. Reinhardt and Ray Galbraith.

WHITEHEAD BROS. CO., New York.—The booth occupied by this company will be fitted up as a rest room; represented by Alfred J. Miller, Charles E. Andrews, Andrew Y. Gregory, Alexander Haigh, V. L. Whitehead Jr., R. L. Cleland, J. T. Kelly, R. J. Hashagen, T. F. Hogan and J. H. Whitehead.

WHITING FOUNDRY EQUIPMENT CO., Harvey, Ill.—This company will exhibit an operating model of a crane trolley; a round steel plate tumbling barrel; a turntable with grooved tracks; a 2-ton charging car; a 2-ton worm geared crane ladle and photographs and drawings of installations made by the company; represented by R. H. Bourne, A. H. McDougall, W. R. Hans and R. S. Hammond.



WHITMAN & BARNES MFG. CO., Akron, O.—This company will demonstrate a patented twist drill; represented by George Hine, R. A. Ammon, A. A. Williams and Ralph Templeton.

WOOD'S, T. B., SONS CO., Chambersburg, Pa.—Equipment used in connection with the system of taper snap molding employed by this company, including taper snap flasks and automatic snap jackets will be exhibited. A flask will be operated in connection with a power squeezer machine; represented by Charles M. Wood and Victor Lesher.

WOODISON, E. J., CO., Detroit.—Various types of molding machines, core machines and core oil, snap flasks, mold jackets and other foundry supplies will be shown; represented by E. J. Woodison, C. H. Woodison, J. C. Woodison, G. A. Burman, J. F. Webb, W. H. Muir, W. J. Wark, R. W. Davidson, J. M. Witters, M. A. Bell, R. S. Hoffman, W. H. Haggman, W. M. Burroughs, E. A. Mead, W. M. Maybank, H. T. Taylor, F. F. Shortsleeves, M. M. Werckman, D. D. Baxter, H. M. Chamberlin, J. W. Shotts and M. T. Thomson.

YOUNG BROTHERS CO., Detroit.—An oven compartment equipped with gas and electric heat will be exhibited. The method of heating by oil or coke also will be indicated. This oven will be arranged to handle cores on lift racks by means of a hand or power lift truck; represented by George A. Young, R. B. Reed, G. G. Parry, T. P. McVicker, W. C. Wagner and A. H. Ackermann.

Efficient Planning and Routing Aids Production in New Cleveland Plant

BY E. W. KREUTZBERG

Fig. 1—Foreman's Desk in Automatic Department. Each Compartment in the Board on the Wall Represents a Machine

IN MANUFACTURING large quantities of small parts, production depends largely upon the ease and rapidity with which the work progresses through its various stages from raw material to the finished product. Experience has proved that in order to insure the steady movement of pieces from one operation to another, each job must be carefully studied before work on it is commenced so that every detail affecting its execution may be anticipated. Once a schedule of operations has been intelligently worked out, it serves as a time table on which the production department and the foreman of the various operating units may depend in handling the job.

Routing, which is the dispatching of work from one machine or department to another, goes hand in hand with planning. Efficient routing is impossible if the operations required to finish a job are not properly planned in advance. On the other hand, the most elaborate planning system is worthless unless it is accompanied by an adequate method of routing.

An unusually good example of a plant in which carefully planned work is efficiently routed is found in the recently completed Coit road works of the National Acme Co., Cleveland. The plant is devoted exclusively to the manufacture of the products of automatic screw machines and allied secondary operation equipment, the average monthly output being in excess of 50,000,000 pieces. The problem of maintaining a satisfactory organization to handle this large production is complicated by the fact that a great many orders of widely varying sizes are executed, involving small parts of many different designs. In planning and routing work it is necessary to consider the capacities of the 1800 machines in the plant, including automatic screw machines, bolt threaders, screw slotters, drillers, grinders, milling machines, second-operation machines, etc. Allowance also must be made for handling a large proportion of the total output of the plant in a heat-treating department which accommodates among other pieces, 250,000 nuts daily and consumes 900 gallons of fuel oil.

FIG. 2—REPRODUCTION OF TICKET USED IN THE BOARD SHOWN IN FIG. 1

The automatic machine products are made exclusively from brass, steel and iron bars which are unloaded from railroad cars and carried on electric trucks to a spacious stock room, 80 feet wide, extending across the full length of the southern bay of the plant. The machines are arranged so that the work of smallest diameter is performed in the eastern portion of the shop, the size of the work increasing progressively in each battery of machines from east to west. The bar material in the stock room is stored in a similar manner, with the small sizes in the east and the largest in the west end of the department. The bars are stacked in racks consisting of horizontal steel beams in which adjustable vertical metal posts, which serve as partitions, are fastened. The bar stock is handled by electric hoists manufactured by the Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., which run on an overhead monorail system and are equipped with specially designed metal slings for handling the bars. The storage racks and one of the hoists are shown in Fig. 5.

All of the work which passes through the shop is classified as stock or special jobs. Stock jobs comprise the work of standard design, such as bolts, nuts,

screws and studs, which can be finished and stored in anticipation of actual orders. Special jobs are those resulting from orders to customer's sample or blueprint and for which machines must be specially tooled to produce. The designs of a number of representative jobs are shown in Fig. 19.

When an order is received, proper record of it is made in the office of the works manager and a sample of the required piece or a blueprint with specifications is sent to the estimating department in the northeast corner of the plant, adjacent to the offices of the works superintendent and chief inspector. The estimators calculate the speed at which the job can be handled, decides upon the size and type of machine best fitted to do the work and determine the amount of metal, in pounds, required to complete the order. The preliminary survey of the job made by the estimators forms the basis of cost estimates worked out in the cost department.

From the estimators the sample or blueprint goes to the chief inspector who examines its different dimensions, threads, drilled holes, knurls, etc., and orders the required complement of gages to be used by machine operators and departmental inspectors. He also must study the job carefully, anticipating irregularities which might lead to rejection of work.

The sample or blueprint next goes to the general foreman who confers with the departmental foremen upon the method of handling the job. They decide what tools are required, issue the proper orders and send the sample or blueprint, with necessary directions, to the tool room.

Forming tools play an important part in the work of automatic machines. These, together with an adequate complement of tools for each operation, are made in the tool room and delivered to the foreman of the automatic department. After each job is completed, the tools, gages, samples of the work, and the production record are assembled and filed in a specially designed metal rack where it remains for five years.

When a job is received in the automatic department, a card similar to that shown in Fig. 2 is made out. White cards are used for stock jobs and pink cards for special jobs. When the work is assigned to a machine, the card for the job is placed in the compartment of the wall rack shown in Fg. 1 corresponding to the number of the machine. The rack serves as an indicator of the working status of the machines. The three empty compartments appearing in Fg. 1 indicate that only three machines are idle.

As soon as a job has been assigned to a machine, the sample or blueprint and the tools are turned over to the lineman who has charge of the machine. Linemen are experienced mechanics who are familiar with every detail regarding the operation of automatic machines. Each lineman is in charge of a line or battery of machines and is responsible for setting up machines for jobs and making repairs and adjustments. The time required for rigging up an automatic for a special job varies according to the intricacy of the work. When the lineman has adjusted tools and speeds until he can accurately reproduce the sample or conform to the blueprint in quantities corresponding to the speed designated by the estimator, he takes a finished piece and delivers it to the departmental inspector. When he has examined and O. K.'d the sample, the machine is turned over to an operator who is responsible for maintaining production at the prescribed rate until the job is finished.

FIG. 4—EXTERIOR VIEW OF THE COIT PLANT OF THE NATIONAL ACME CO., CLEVELAND, WHE

FIG. 3—PRODUCTION BOARD IN THE CLEARING DEPARTMENT

Each evening a night gang takes the day's run from the machines and replenishes the supply of oil for the next day. The work, which is mixed with turnings, is scooped up into pails by means of specially shaped hoes and carried on electric trucks to the cleaning department. A tin ticket bearing the number of the department and the machine is placed in each pail. In the cleaning department the pails are piled together without any attempt at classification, the tickets in the buckets being relied upon to do this later. The oil is first removed in centrifugal extractors. The dry mass of metal next is placed on a sifter whose inclined screen and jarring action causes the automatic products to gradually slide down the sloping screen into steel boxes at the foot. Most of the scrap in the form of tiny chips, falls through the sifter into boxes to be later dumped into trucks. Drillings and borings are too

UCTS ARE TURNED OUT AT THE RATE OF MORE THAN 50,000,000 PIECES MONTHLY

large to pass through the mesh of the screen and are easily removed by the workman in charge of the apparatus. The power sifter is clearly illustrated in Fig. 6.

The work, free from turnings, is subjected to a steam bath in specially designed washing machines made by G. S. Blakeslee & Co., Chicago. Each of these machines consists of a moving, electrically-operated conveyor and two tanks. Workmen place the products, still in the steel boxes in which they left the power sifters, on the conveyor which carries them into the first of the two tanks where they come in contact with a boiling solution of soda, alkali and water. The boxes next enter a rinsing bath which removes final traces of oil from the products. The boxes are removed from the conveyor, sprayed with thin oil to prevent rust and placed on trucks which carry them to the assorting department, shown in Fig. 12. Here the remaining scrap, consisting of bar ends, etc., is removed.

Progress of Work is Checked

Many of the products of the Acme company cannot be completed on one automatic screw machine and must go to other machines for supplementary operations. The clearing department, which receives the cleaned pieces from the assorting department, is responsible for routing unfinished products to the proper machines for completion. A close check is kept on the progress of each job by means of the production board shown in Fig. 3, which provides for a record of the work of every machine in the automatic department. The large numbers in a column on the left hand side of the board indicate machine departments, while the smaller numbers, in horizontal row, represent the machines. Small hooks in the board support tickets and samples of the work. Each ticket bears information regarding the progress of the work while the finished piece aids the clearing department in tracing the order.

The products of each day's run are weighed, the number of pieces being determined by weight rather than by actual count. As each pail is weighed, the tin ticket which has been previously mentioned, is removed and a white paper ticket bearing the number of the machine, the number of the department and the name of the firm for which the job is being done, is put in its place. The tin tags, having served their purpose, are returned to the automatic departments. The weight of the finished product, as determined in the clearing department, is subtracted from the weight of the bar stock used for the order, and the difference, which represents the scrap, is credited to the customer.

If the weighing of a day's run shows that production on an order is falling behind, the clearing department refers to the production board which shows at a glance which machine is behind in output. The foreman in charge of the automatic is notified of the shortage and provision is made for increasing the output.

The shipping department, a portion of which is shown in Fig. 15, is in the north side of the plant adjoining the clearing department. The finished products are carried to the shipping room in large electric trucks.

A small portion of the special work going through the plant requires polishing in addition to the regular first and secondary operations and for this class of products a special department has been established, comprising a number of vertical polishing machines, as shown in Fig. 9, and additional units of different sizes and shapes. Bolt heads, nuts, screws, etc., which require polishing, case-hardening, etc., pass through the clearing department as in the case of products direct from the machines.

Many of the nuts and screws are case-hardened before they enter the stock room. A battery of case-hardening furnaces, made by Strong, Carlisle & Hammond Co., Cleveland, is shown in Fig. 7. As the automatic products come from these furnaces, they are quenched by means of the apparatus shown in Fig. 8.

Oil Drains From Scrap

About 50 tons of turnings are produced daily from the automatics and nut and special operation machines. This is hauled out of the plant in big dump trucks similar to that shown in Fig. 6, and deposited in a large concrete pit in the rear of the plant. Here it remains for a day or two until practically all of the oil still remaining in it drains into a tank underneath the bin. The scrap is then loaded into cars by means of a locomotive crane made by the Orton & Steinbrenner Co., Chicago.

The Coit plant of the National Acme Co. embodies many features calculated to facilitate production. The main building, shown in Fig. 4, is a 1-story struc-

FIG. 18—A VIEW OF ONE OF THE WASHROOMS IN THE COIT PLANT OF THE NATIONAL ACME CO.

ture with sawtooth roof covering approximately 7½ acres. This type of construction, which permits the use of large areas of continuous sash above all working floors, affords good daylight illumination. Artificial lighting is provided for by high-powered electric lamps spaced at intervals of 25 feet and located 11 feet above the floor.

An unusually effective heating and ventilating system has been installed. Each of the four units consists of a supply fan, heater, air washer and return fan, vacuum pumps and circulating pumps. The air washers of the two larger units have a capacity of 90,000 cubic feet of air per minute. The air entering the washers may come from outside the plant, or if desired, returned air may be re-employed by opening louvre dampers which control the volume of air to be recirculated. The washed air enters the heater, where it is heated by means of live steam reduced to 5 pounds pressure and exhaust steam from pumps and engines. The condensation from the heaters is collected in four heavy-duty traps and discharged by means of a vacuum pump into feed water heaters in the boiler room. The washed and heated air is distributed in the plant through supply ducts suspended above the lower chord of the trusses. The supply and return fans may be driven by motor or steam engine.

Fig. 18 shows one of the wash rooms of the plant. The floor throughout the main building is of woodblock. In each department where oil is used extensively, sawdust is thrown on the floor in the morning and swept up in the evening. The sawdust, with its accumulation of oil, is burned.

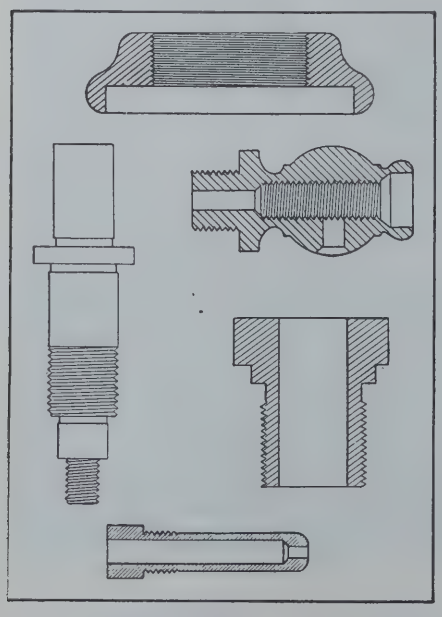

FIG. 19—CROSS SECTIONS OF CHARACTERISTIC AUTOMATIC PRODUCTS

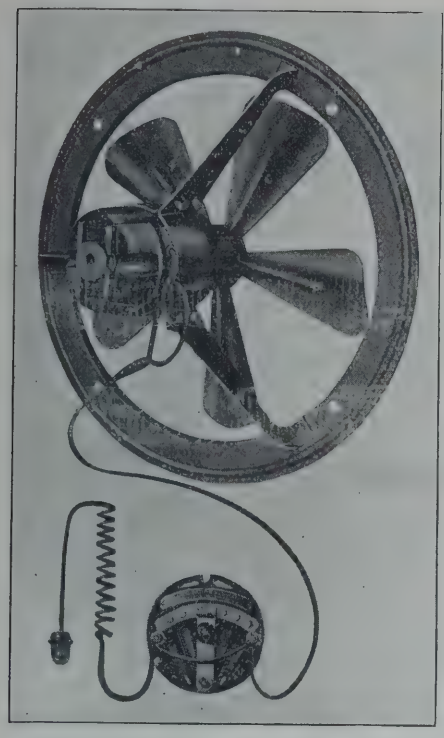
Cafeteria Serves 1500 *Employes*

Among the features recently added to the plant is a cafeteria system, consisting of several serving units in convenient parts of the building and a central kitchen in which food is prepared for all units. The cafeteria is well equipped and amply fulfills the needs of the 1500 employes. Separate dining rooms are provided for men and women.

The National Acme Co. also operates a large plant on Stanton avenue, in which automatic machines, threading dies and taps are manufactured. Prior to the time the Coit plant was completed, the manufacture of machines and machine products was carried on in the old plant. Building operations on the Coit plant were commenced in the fall of 1917 and during the war a portion of its capacity was devoted to the production of parts for Liberty motors. The officers of the company are A. W. Henn, president; E. C. Henn, vice president and general superintendent; and N. S. Rathburn, secretary and treasurer. W. R. Mitchell is works manager of the Coit plant.



Pattern Plates Dried by Electrical Heaters

Moisture, which collects on the surface of cold-metal patterns, comes from the damp sand and from the atmosphere on humid days. When a pattern is wet the sand of the mold adheres to it causing small holes on the surface of the mold which then produces a rough casting.

The collection of moisture can be

HEATING METAL PATTERNS ELECTRICALLY

VENTILATING FAN, SPEED CONTROLLER AND FLEXIBLE CORD

prevented by heating the pattern. The heat applied, however, must not be so great as to cause the sand in the mold to dry, as it would then crumble away and again the casting would have a rough surface. Furthermore, the heat must be applied in such a way that the pattern can be conveniently changed when desired.

The usual method of heating is by means of a gas flame left burning in the space underneath the pattern within the frame work of the molding machine. It is difficult to keep the flame low enough so that it will not heat the pattern too much. A larger flame than necessary is, therefore, employed at some distance from the surface of application. This makes an inefficient arrangement, as most of the heat is dissipated into the surrounding space. Some trouble is also experienced in keeping the flame properly regulated.

In order to obtain a more efficient and convenient method for heating molds the Westinghouse Electric & Mfg. Co. manufacture electric heaters, one style of which is shown in the accompanying illustration. Two steel-clad heaters are shown mounted in the space immediately below the metal pattern plate, within the frame-work of the molding machine. In order to use as little heat as possible, they are located just below the thickest pattern used. They are attached to supporting angles connected to the frame of the machine. It is obvious then, that any pattern of any thickness and of any size within the capacity of the machine, may be attached to or removed from the molding machine without being interfered with by the heaters, and without disturbing the heaters.

An asbestos insulating plate is inserted just below the heater to prevent undue loss of heat.

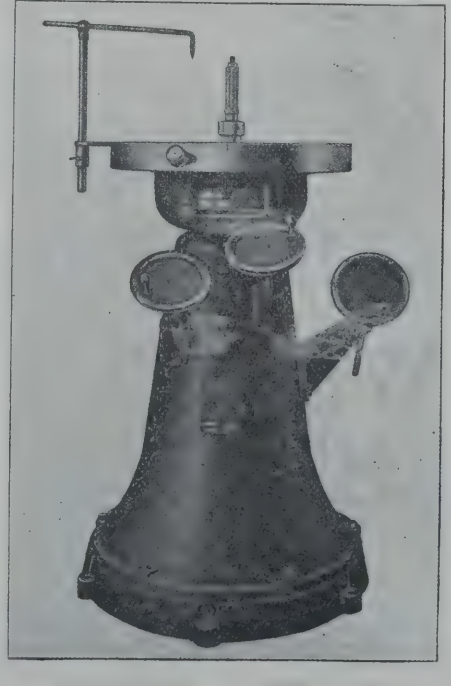
The heaters consist of slotted ribbon resistors insulated in mica troughs, the whole being enclosed in a heavy sheet-steel casing. The two heaters used on each machine have a total rating of 300 watts and operate on 110 volts. Connection is made to a wall recepticle convenient to the machine, by means of a flexible cord having a separable attachment plug on the end of it.

If for any reason, such as the machine standing idle, the pattern plate should become overheated, it is only necessary to pull the plug from the recepticle and leave the heater disconnected until the plate cools to the proper temperature.

Small Ventilating Fan is Easily Installed

A light fan has been designed by the Buffalo Forge Co., Buffalo, for ventilating close or fume-filled offices, chemical plants or shops. It is claimed that the 5-blade fan, which is 16 inches in diameter, can handle 1000 cubic feet of air per minute. The motor, which is totally enclosed, has a variable speed and operates on any 110 or 220-volt direct-current or single-phase alternating-current of from 25 to 60 cycles. Ball bearings are used to produce smooth and noiseless running.

The motor is supported in a pressed steel tripod which offers small resistance to the flow of air. No wiring is necessary in installing the fan, the flexible cord and plug being made to fit an ordinary light socket. A speed controller designed to give six speeds ranging from 500 to 1000 revolutions per minute is part of the fan equipment. The fan is rated as approximately 1/30 horsepower.



Designs New Machine for Dynamic Balancing

To insure quiet running, rotating parts should be carefully balanced. Otherwise vibration is bound to be in evidence. This applies to all revolving units that are run above normal speeds such as flywheels, gears, propellers, turbine rotors, etc. An expert workman can balance almost any running part in the engine lathe provided he is given plenty of time. However, as he is guided by rule-of-thumb only, the results are gained at a high labor cost.

To permit the balancing of rotating parts quickly, the machine shown in the accompanying illustration recently was developed by the Crawford Tool & Mfg. Co., Chicago. This machine is designed to handle rotating parts which need not be in static balance. When the machine is set in motion it indicates the amount of vibration that is present. Then, by means of tables which accompany the machine, the correct amount of metal to remove from the heavy side is readily ascertained.

The operation of the machine is comparatively simple. The operator puts the part to be balanced on the spindle and locks it securely in place. The machine is then started at low speed and if the indicator does not show a vibration exceeding 10 points the speed is increased. Then by manipulating the hand wheels at the front of the machine, the part is brought in balance. This is accomplished by throwing the spindle off center. The amount to remove from the part to bring it in balance is easily found. Thus after the heavy side has been lightened, as for instance by drilling, the part is tested again.

It is said that the machine is simple to operate and that with a little experience an ordinary operator can bring the piece to be tested into dynamic balance within eight seconds. A chart accompanying the machine gives the number and depth of holes to drill to remove various amounts of metal in balancing.

SELF-CONTAINED BALANCING MACHINE

Government's Stocks Increase

Liquidation of Contracts Progressing so Rapidly That War Department's Iron and Steel Tonnage Advances From 577,021 to 643,515 in Month — 87 Per Cent of Contracts Now Settled

WASHINGTON, Sept. 23.—Liquidation of contracts by the war department has progressed so rapidly that the stocks of iron and steel it had on hand Sept. 9, 643,513 tons, practically all of which were held by the ordnance department, exceeded by approximately 65,000 the quantities on hand Aug. 9, when the total was 577,021 tons. Figures showing the tonnage on hand on the former date are presented in an inventory completed last week by the raw materials and scrap section of the war department.

Of the stock on hand, 335,999 tons was listed as scrap. This included such items as 174,123 tons of shell forgings, as compared with 224,219 tons of similar material on hand Aug. 9. The increase in stocks on hand is reflected chiefly in adapter and booster assemblies, scheduled as scrap, of which there was 86,771 tons, as compared with only a light tonnage on Aug. 9. Billets showed a decrease from 110,382 tons to 93,186 tons, and ingots from 46,270 tons to 35,572 tons. Nonferrous metal on hand totaled about 110,000 tons.

The itemized schedule of tonnage held by the ordnance department, representing virtually the entire total, follows:

Raw Materials:	Tons
Ferromanganese	37
Ferrosilicon	162
Pig iron	4,985
Speigeleisen	476
Zirconium ore	740
Manganese ore, ground	120
Miscellaneous	24
Total	6,544
Semifinished	
Billets	93,186
Ingots	35,572
Nickel steel ingots	3,731
Total	132,489
Finished	
Band iron	23
Bar iron	42
Flat iron	52
Galvanized iron	37
Sheet iron	72
Structural iron and steel	624
Armor plate	1,800
Miscellaneous sheets and plates	75,932
Flange steel	2,088
Rails	1,065
Cold-rolled rods and sheets	16,975
Hot-rolled rods and sheets	1,721
Drill rods	237
Welding rods	69
Shell rods	37,354
Adapter steel	1,095
Annealed steel	1,011
Beveled steel	11
Coil steel	113
Copper-clad steel	5
Decarbonized steel	36
Galvanized steel	162
Gun steel	1,817
Hexagonal steel	982
Machine steel	223
Reinforcing steel	503
Screw stock	10,277
Special steel	588
Spring steel	93
Strip steel	1,431
Tool steel, carbon	2,744
Tool steel, high speed	233
Miscellaneous tool steel	827
Tin plate	1,886
Terne plate	586
Bars	93
Miscellaneous	400
Square bars, 2½ inch	30
Plates and angles	177
Strap iron	8
Tubing	538
Pipe and tube	600
Total	164,560
Alloys	
Manganese steel	105
Chrome steel	78
Chrome nickel steel	71
Nickel steel	3,179
Nickel steel plates	79
Chrome vanadium steel	511
Total	4,023
Scrap, total	335,999
Aluminum	70
Brass	108,311
Bronze	267
Copper	363
Lead	1,013
Zinc	10,887

Contracts reported on Aug. 30 as liquidated by the war department totaled 22,030, or 87.4 per cent of the 25,196 contracts suspended. Of the liquidated contracts 10,022 or 45.5 per cent relate to purchase and storage. The value of liquidated contracts is $1,981,005,000, which is 52.5 per cent of the total value suspended, $3,774,964,000. The value of uncompleted portions of contracts liquidated during the week ended Aug. 30 was $40,670,000, payment to contractors in settlement being $6,433,000, the saving effected being $34,237,000, or 84.2 per cent.

An outlay of $251,000,000 will be required to secure relinquishment of the $1,794,000,000 of suspended contracts still unliquidated, assuming that future liquidation in each bureau can be effected at the same rate of cost as has obtained in the past. The bureaus having the largest values of unliquidated contracts are: Ordnance, $1,390,000,000; air service, $250,000,000, and purchase and storage, $134,000,000.

Tractors and heavy artillery constituted a large part of the August production. The important items include 95 175-millimeter recuperators; nine 155-millimeter gun forgings; 13 155-millimeter guns; nine 240-millimeter howitzer forgings; 27 240-millimeter howitzer machinings; 18 240 millimeter howitzer recuperators; 18 240-millimeter howitzer carriages; 20 12-inch railroad car mortars; 600 Browning tank guns; 92 10-ton artillery tractors, and 53 20-ton artillery tractors.

Allied Nations in Trade Conference

WASHINGTON, Sept. 23.—Delegates from England, France, Belgium and Italy will be present as representatives of the metal industries of their countries at the international trade conference to be held at Atlantic City, Sept. 30-Oct. 3, at the invitation of the Chamber of Commerce of the United States.

Among the British delegates will be Bailie John King, chairman of the National Light Castings association. French delegates will include M. Paul Schneider, president of the French mission and of the Creusot Works; M. Pousset, M. Peson and M. Dion, engineers, the first named being assistant to M. Schneider. The French delegates will represent chiefly the steel industry. Among the Belgian delegation will be Albert Never, engineer and manufacturer, and Louis Canon-Legrande, president, permanent committee of the international congress of chambers of commerce; president of the Federation of Commercial and Industrial associations of Belgium, and president of the Chamber of Commerce of Mons. The Italian delegation will include Commander Pio Perrone, of G. Ansaldo & Co., representing the shipyards and metal manufacturers of Italy.

Under the heading of major topics at the conference is scheduled economic readjustment of commercial and industrial conditions in England, France, Italy and Belgium. It is deemed essential that a frank state-

ment be made as to what is needed to place these countries on a basis of stable and enlarged production. This may involve an inventory of available supplies and resources, with the view of arriving at an estimate to serve as a guide to American business men, manufacturers, producers, bankers, etc., in planning their trade relations in the future.

Foreign exchange and all the forms in which questions of credits may arise will be discussed. England recently announced a plan for credits up to three years in connection with sale of British goods to unsettled parts of the Near East. Italy may have special needs for capital for rehabilitation and expansion of its industries and may find value in an opportunity to describe the relation of its proposed taxation on capital to new investments. Even the German mark and its exchange value may be considered.

"It is recognized that wars have been due to trade rivalry," says the national chamber's announcement. "Perhaps it has not been sufficiently noticed that the commercial hostility which leads to armed conflict may probably be a cumulative effect of innumerable irritations of unfairness and discrimination, having an influence in official circles which are in communication and sympathy with the commercial class. These practices are all manifestations of a spirit of hostility which might possible be lessened by discussion. A general consideration of unfair competition in foreign trade to see how far the principles of fairness, which have been applied in legislative and administrative regulation to domestic trade, might be applied to international trade."

There will be an American committee for every subject, including producers, shippers and economists who will meet from day to day with the foreign delegates. By this method of procedure every foreign delegation will have opportunity to state the needs of his country to the appropriate committee.

Government to Complete By-Product Ovens

Washington, Sept. 23.—Expenditures to the extent of $15,000,000 are being made by the war department for the construction of by-product coke ovens, witnesses told the house committee on war expenditures last Friday. The building of the ovens had progressed to such a point by the time the armistice was signed that it was held to be impractical to cancel the contracts under which they are being erected. Witnesses included Col. J. H. Burns, former Capt. George R. Roe, of the ordnance bureau, and Russell S. McBride, of the bureau of standards. It was stated that the supply of toluol exceeded the army's needs.

The contracts involved four plants, including those of the Donner Union Coke Co., Buffalo; the Domestic Coke Corp., Fairmount, W. Va.; the Birmingham Coal & By-Products Co., Birmingham, Ala., and the International Coal Products Co., Clinchfield, Va. The contracts for the first three plants were given to the Koppers Co., and involve an expenditure of $13,000,000. The expert adviser of the bureau of ordnance for the building of the plants was C. J. Ramsberg, who is associated with the Koppers Co.

Captain Roe, the engineer in charge, said that the government, which is advancing the money to build the ovens, has the right to take any part of their product, with the condition that, when completed, the prospective owners will take them off the government's hand at an appraisal which may be as high as 85 or 90 per cent of the cost.

The contract for the plant at Clinchfield went to Ford, Bacon & Davis, engineers, the government advancing $2,000,000 to the owners, which is to be repaid in full in four annual installments with 5 per cent interest.

Submit Plan For Disposal of Merchant Fleet

Washington, Sept. 22.—A plan for the gradual disposition of merchant vessels will be urged upon congress by the National Merchant Marine association if recommendations of the executive committee of the association are adopted.

The committee is convinced that ultimate private ownership and operation are essential to the upbuilding of a merchant marine but at the same time its investigations have brought it to the conclusion that an immediate sale of all the ships is not only undesirable but impractical.

The committee recommends that the government sell its steel vessels of desirable types to American individuals or firms as the demand from responsible purchasers develops. The smaller vessels, the committee thinks, should be sold at once, without restriction as to purchasers.

Pending the development of a market for the government ships, the committee recommends that the vessels be chartered to private concerns. Such government vessels as are operated by the government the committee feels should be used to develop new trade routes and should not be used to compete with privately operated lines where those lines are giving adequate service.

Freight Rates to Uruguay and Argentina Reduced

Washington, Sept. 23.—Reductions ranging from $2 to $7.50 a gross ton have been made by the shipping board in freight rates on iron and steel articles from United States Atlantic ports to ports in Uruguay and Argentine. Plain wire is included in the list. The reductions, which became effective Aug. 21, include the following:

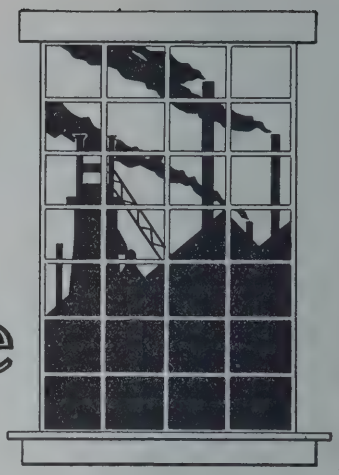
Iron and steel articles to Montevideo, Uruguay and Buenos Aires, Argentine, from $20 to $18; barbed wire, from $22.50 to $20.

Iron and steel articles to La Plata, Argentine, from $22.50 to $20; barbed wire, from $25 to $22.50.

Iron and steel articles to Rosario and Bahia Blanca, Argentine, from $25 to $23; barbed wire, from $27.50 to $25.

Iron and steel articles to Port Madryn, Argentine, from $35 to $30; barbed wire, from $40 to $32.50.

Col. Woods Makes Plea For Technical Men



Washington, Sept. 23.—More than 15,000 discharged officers and enlisted men of technical and professional training and executive ability have been in communication with Col. Arthur Woods, assistant to the secretary of war, concerning their employment in civil life, since the establishment of his office in Washington. Of this number some 10,000 have been referred to opportunities for employment in practically every line of business requiring men of special training.

"During the war, and since the armistice, so many changes have been made in the personnel of manufacturing concerns and business organizations in general, that a large number of technical men on their return find it necessary to look for new places in their professions," said Colonel Woods. "Theirs has been a difficult problem for several reasons. One is that while they have been directing their energies along new lines, their work back home has often been undergoing radical changes.

"Some have not been placed, and others are to be relieved from service. It is for such men that we are making effort to open new fields. The revival of the construction of public works has helped much, but this source cannot be expected to assume the full burden, and we must look to the business world for opportunities. We hope that they will be offered to us."

Little Stories of Business Life

A Precious Quarter

TO write a $4,000,000 check in payment of a property which five big steel companies had tried in vain to obtain within the past two years, then be virtually held in pawn in a barber shop waiting for some one who knew him to come in and pay for his shave is an experience that befalls few of us. But it happened to Charles M. Schwab recently. Mr. Schwab went to Pittsburgh, met James J. Flannery and J. Leonard Replogle, went out to the Bridgeville vanadium works, inspected the plant and then wrote a check for $4,000,000, payable to Mr. Flannery. Later in the day Mr. Schwab stopped for a shave in the barber shop of the Dusquense club.

"Nobody I knew came in for nearly an hour," said Mr. Schwab in telling the story. "Then I saw Willis L. King, vice president of the Jones & Laughlin Steel Co., and Willis loaned me a quarter. I paid the barber and got out of 'hock.'"

Blast Furnace Twins

NOT often is it possible for two crews of blast furnace workers to compete with practically all elements exactly balanced, and to compare production figures from month to month. Such a case now exists in the Chicago district, two stacks having been built from the same plans at almost the same time by the same engineers and both under the same ownership, but located several miles apart so that absolutely separate organizations control them. One of these is at the plant of the Iroquois Iron Co., South Chicago, and the other at the plant of the Mark Mfg. Co., Mark, Ind., both subsidiaries of the Steel & Tube Co. of America. So closely do these stacks run that more than a few hundred tons difference in the monthly output never is noted. In the 31 days of August, the tonnage was about 400 tons in favor of one stack. The sport of competition between the operating forces of the two plants is keen and it serves to produce the best possible work from those responsible for results.

Preparedness

HOW the foresight of the Perrone brothers, operating the great Ansaldo Co., at Genoa, probably saved Italy from defeat at the hands of Austria is related by Frank A. Vanderlip in his new book "What Happened in Europe." When Germany began the war, and before Italy became involved, the Perrone brothers converted their plant into an ordnance establishment. They could not obtain at that time orders from either the allies or from their home government. Regardless of this fact, however, they made 2000 pieces of ordnance of the same design as the most efficient French guns.

"Then come the Ceperetto disaster," Mr. Vanderlip relates. "Not until that awful defeat did the Italian government turn to them (the Perrone brothers) with cries for guns. When the first order was placed the officials were confounded on being told that the guns were ready for immediate delivery. These 2000 guns were at once put in the field to take the place of the vast losses which the Italian army had sustained, and furnished Italy a service in stopping the advance of the Austrians the value of which can hardly be measured."

Steel Spines and Millions

FOR years metaphors have been taken from the world's great basic industry, the iron and steel business. We have heard of "the iron heel" and "the mailed fist," many times during the past five years. Ancient history refers to "the iron-clad army." Memory also brings "the iron chancellor" into prominence when Bismarck is mentioned. The Bible refers to "the pen of iron" and "the rod of iron" while Shakespeare speaks of "the steel couch of war" and wrote: "Grapple them (friends) to thy soul with hoops of steel." Modern oil stock venders, likewise make use of such similes. One Texas oil company's get-rich-quick propaganda appeals to the gambling instinct direct. The promoters are "playing a game that has made millionaires over night;" but state "it is not a game for weaklings but one for 'steel-spined speculators.'"

Averting Strike Loss

AN incident connected with the Akron, O., machinists' strike, indicates how a fair-minded operator of a machine shop in Cuyahoga Falls, O., kept his shop running full and his men at work after they had declared their intention of walking out in sympathy. One morning after the workmens' spokesman had delivered their ultimatum, the owner of the shop went out into it, called his men around him and said:

"Men, you have told me that you are going to strike in sympathy with your Akron friends and I don't blame you. Were I in your place, I should strike too. But, let's look at this proposition in the right light and do a little sane financiering. We all live

here in Cuyahoga Falls; if you strike, you'll be without work for the duration of the walk out and at the end you'll be out just so much money. I'll tell you what I'll do. You stay on and work and let the Akron men strike, if they want to. If they strike and gain their demands, whatever they are, I'll adopt them for this shop union or nonunion. If the award is made retroactive, it will be made retroactive here as well. Now, what do you say, are you going to stay on at work and keep this shop running full?"

A chorus of "sure" was the response and the shop has seen no idle moment since.

Owe Schwab a Title

SCHWAB should have been made a duke. If any man ever deserved the gratitude of England, Schwab is that man. But he has not even received the "order of the bad egg."

Thus Baron Fisher of Kilverstobne, former first lord of the British admiralty, in a recent article on the war compliments Charles M. Schwab for the service he rendered England in delivering "a batch of submarines" in record time.

"When I left the admiralty on Jan. 1, 1910, there were 61 efficient submarines and 12 were building," Baron Fisher wrote. "When I returned to the admiralty in October, 1914, there were only 51, so I sent for Mr. Schwab, of the Bethlehem Steel Works, and he delivered a batch of submarines in five months, an unprecedented feat, as 14 months was the record until then. These H type submarines built by Schwab went unconvoyed from America to the Dardanelles and acted there prodigiously."

Music Hath Charms

FEATURED at the recent convention of the National Association of Organists, in Pittsburgh, was an address by Frank E. Morton, acoustic engineer of the American Steel & Wire Co., Chicago, New York and Cleveland. It was entitled, "The Organist's Influence and Responsibility," and presented the great and pressing need of a new kind of music to be used as a stimulating force in modern industry. Mr. Morton urged the organists to realize the perils of the music famine in this vitally important field and to exert all their influence in encouraging an output of the right sort of music for use in the workshops of today. He said in part:

"For scientific agriculture the old plantation melodies are not adaptable; for the vast woolen and cotton mills of today the spinning song is out of date; the herdsman's pastoral is too feeble to combat the cacophonous chorus of a stockyard; stokers in a liner's engine room or deckhands on an oil tanker do not respond to barcarole; roller process mills fail to chime in with the rollicking ditties of the jolly miller; and the village blacksmith can sing no role in the great ensemble of an automobile factory.

"Music of today is not impotent to typify anything beyond the most primitive activities of man. Industry is not unpoetical, inartistic, unmusical because its magnitude for the moment staggers the imagination of the music purveyors so that they turn from it to paltry trifles.

"For a time science, too, lost its contact with life; perched itself on an inaccessible peak and considered it derogatory to its Godlike achievement to be of practical, human everyday assistance. But science for science's sake has had its day. Live science has become a reality, a big reality. Live music, that will do its part in turning the wheels of the world's workshops, is a possibility of the future."

Machinery by Air

THE feasibility of transporting machinery and supplies by airplane to the numerous gold and silver mines in the States of Sinaloa, Mexico, is to be investigated by the British government, according to an article in a recent issue of *Commerce Reports*. According to the story, it appears that a British company is prepared to organize and operate an air service between the mines and railway stations for the transportation of machinery and supplies to the mines, which, due to their mountainous location and the absence of roads, at present are practically isolated. At present it is practically impossible to transport heavy machinery to these mines and the only machinery which can be transported must be carried on the backs of burros, whose maximum limit of carrying is about 500 pounds each. It is understood that it would be the purpose of the proposed company, to transport machinery weighing several tons.

Eminence in Small Places

MANY articles in common use come into our hands without a thought as to their production, thus the obscure little town of Westfield, Mass., produces 90 per cent of the world's whips, and another little New England town, Alton, N. H., has the world's largest plant for the manufacture of cork screws. William R. Clough, the manager of the latter company, is the inventor of a machine which automatically turns out the completed articles. A piece of wire is fed into the machine at one end, and comes out in the form of finished cork screws at the other. These machines while in existence more than 20 years are still protected by patent interests, and although they are leased to anyone desiring to manufacture cork screws, they are never sold.

Purpose, the Stabilizer

SECRETARY LANE of the interior department, in appearing before the senate committee on education in behalf of the Americanization bill, summed up what was accepted as a comprehensive view of the reasons for the industrial unrest in this country. He said:

"The people want thought given to their concerns. They knew where they were going during the war. They were all co-operating for the destruction of the enemy. They enjoyed the definiteness and the concreteness of that objective. They could see where they were going each day. Then peace came and they lost that objective.

"Life seemed comparatively without purpose. They were thrown back upon themselves and to purely selfish concerns. We lost our national morale because we failed to keep alive the idea of Americanism as we had kept it alive in the war. We had been going forward purposefully in the great work of winning the war and we did not shift back quickly enough to the work of putting our steam into the work of giving a new motif to the American drama."

Benefic Combination

AN interesting contribution to the literature on the high cost of living comes from the department of agriculture. Incidentally, it indicates dealers apparently are making some profits which, under pressure, they are willing to forego. This is the item:

"Through efforts of the farm bureau office of Eddy county, N. M., baling ties were obtained at an actual saving of $450. The orders were pooled and placed through a local store. In addition to the above saving, prices charged by other dealers dropped from $1.75 to $1.30 a bundle."

Piez Declares for Open Shop

Former Director-General of Emergency Fleet Corp., Urges Employers Not to Yield a Particle on Principle Merely to Obtain Temporary Peace—Sees no Hope for Unions Until Leaders Who Violate Pledges are Expelled

ORGANIZED labor cannot hope to make further progress until it has purged itself of leaders who violate agreements made with employers, Charles Piez, former director-general of the Emergency Fleet corporation, told representatives of the Associated Business Papers at their annual meeting in the Congress hotel, Chicago, Sept. 18. Mr. Piez declared in favor of the open shop, and narrated the experience of the Link-Belt Co., of Chicago, of which he is president, to prove that the open-shop principle must prevail, at least until labor is ready to abide by its solemn covenants. Particular significance was attached to his reference to the open shop by reason of the attempt of organized labor in the iron and steel industry to force the issue on employers.

Mr. Piez declared the Link-Belt Co. has operated an open shop for 13 years despite frequent attempts to unionize it. It has done so, he pointed out, because on four successive occasions trade union leaders with whom it had dealings failed to keep their pledges. The employes now recognize that the company is right in refusing to deal with "the welchers" of the trade unions.

Union leaders broke their agreement in the case of the Seattle shipbuilders' strike, Mr. Piez said. The Fleet corporation was bound to certain labor policies which it did not formulate and upheld them when certain labor leaders demonstrated they could not be trusted. It demanded strict adherence to the principles to which the men had subscribed. He urged all employers to stick to principle and not yield in the slightest for the sake of maintaining peaceful relations.

The administration's labor policy, he stated, involved permission to unionize many plants which for years were nonunion, and also provided for shop committees. Labor conditions which obtained in war time have had an effect on the present, but Mr. Piez said he was not sure that shop committees will prove a solution for the labor problem, chiefly because of the delay which is necessarily encountered.

A great share of labor unrest is due to the fact that employes have a wrong understanding in regard to the profits made by employers. Foreign-language newspapers and propagandists are teaching the workers that their employers are making enormous profits, with the inevitable consequence of breeding distruct and avarice. This situation should be met squarely and employers should do all in their power to refute the statements. Mr. Piez said much depends on the training and capacity of foremen and superintendents. His experience as a manufacturer, he declared, convinced him that the only logical method for paying workmen is on a production basis.

Issue Must Be Met Squarely, Says Piez

IF there is any cloud on the horizon of American business, if there is any menace to the continued prosperity of American industry, it lies in the present day labor unrest," said Mr. Piez. "No matter where it had its origin the unrest is being capitalized today by a group which is not aiming at a mere improvement in the conditions and hours of labor, but which is aiming at the control of industry and the control of our great government as well.

"There are some 700 or 800 foreign-language publications, all of them containing poisoned articles against the fairness of the distribution of the profits of industry and against the fairness of our system of government. There are something like 2500 paid lecturers drawn from foreign-born and native intellectuals, who put up a continuous story of the wrongs of the present wage system and the present social regime. Perhaps the biggest cause of unrest, and I have met this not only in my own business repeatedly, but also in my experience with the fleet corporation, is the exaggerated notion which the men have of the profits of industry.

WE have run an absolutely nonunion shop in Chicago for 13 years, and we have done it in the face of a combined effort to unionize us. Why? The men realize that we are justified in our position because in the case of four successive agreements we had with the unions, the unions welched on each and every one of them. The men realize I won't deal with a welcher in business, and until the unions purge themselves of such leadership, a leadership that renounces a solemn covenant and is perfectly willing to breach an agreement for a temporary advantage, the Link-Belt Co. will have nothing to do with organized labor in this city.

Some six years ago we were threatened with a strike at our Indianapolis plant. We have there something like 2200 men. The superintendent called me up and asked me if I wouldn't come down and address the men. I have been in the habit of getting all our workmen together and talking to them collectively for many years, finding this to be highly effective. I hurried to Indianapolis and found when I got there that the strike was threatened not by any conditions inside of our plant but because of some grudge against another plant with which we had nothing to do, and over which we had no control. The strike involved the machinists and toolmakers, two of the very vital crafts in our industry.

"We called them together and I gave them a talk. After I got through, I asked them whether they had any questions to ask. One man who had been with us many years, a very able toolmaker, said: 'Mr. Piez, don't we earn our day's pay in two hours' work?' And I said, 'Well, now, let's examine that. How many hours a day do you work? Nine a day, don't you?' He said, 'Yes.'

"'What do you get?'

"'Sixty cents an hour.'

"'Then your proposition is that you earn $5.40 in two hours' work, for which we pay you $1.20?'

"He said, 'Yes, that is right.'

"I said, 'That means that we are making a profit of $4.20 a day out of your labor. Four dollars and twenty cents for two hours, or $2.10 per hour

profit out of your labor. That is three and one-half times your hourly rate, and if we carried this same argument through, our profit must be equal to something like three and one-half times our total pay roll.'

"I got a blackboard and went through the figures, demonstrated that if his conception of his earnings and the value of his earnings and our profits was right, the profits of the concern would have to be about three and one-half times our pay roll.

"This happened in March, soon after our annual meeting. I sent for our annual report, and then demonstrated that our profits for that particular man were less than $1 per day; the total about 25 per cent of the pay roll instead of 350 per cent. The man said he never knew our profit was so small.

"The radical preachings in the foreign press constantly emphasize the fact that between 80 and 90 per cent of the earnings of the individual go to the master as profit. In the Seattle strike the feeling was that the earnings of the owners were 90 per cent of the total earnings of the man; the company got $60, out of which it paid him $6. A very simple and quick calculation showed the absolute fallacy of that; showed that the profits computed on that conception were between four and five times the value of the annual output.

Sane-Minded Being Misled

"That statement was repeated to me at a conference held in Washington where there were 120 representatives of labor of the western coast. I am giving emphasis to it at present because I believe the fact that the sane-minded, intelligent American workmen have the idea that they are being treated unfairly, and are receiving too small a share of the profit, lies at the very bottom of the general unrest.

"I have no fear that they are going to lead the American workmen into the camp of Bolshevism, but I do fear they are going to change their perspective, because these statements are insiduously made and never refuted.

"Manufacturers shroud their business in too much secrecy. They don't talk it over with their men. I would feel like a thief if I thought that part of the earnings of our company were filched from the men by withholding from them a just part of their earnings. And on that account I am prepared at any time to discuss it with them, to be converted to their side or convert them to mine, if that is possible.

"I have thought that the best way to reach our men is to reach them through our superintendents, our foremen and subforemen. I find that most of those men are intelligent, active, alert Americans, typically good citizens, upon whose judgment we rely to create sound public opinion, and they must be the judges of the correctness of our theories and our methods, and serve as our champions.

"I find among these men there are wrong theories. Some have gotten away from the feeling that this government is a government by majority; they feel there is virtue in an organized minority, an aggressive, vociferous minority, because in certain cases the general public has bowed to the demands of just such a minority. I feel, therefore, that there is absolute need of bringing the foremen and the subforemen back to a realization of the fundamental principles of constitutional government and of business economics."

Mr. Piez then said his company operates on open-shop principles and has done so for 13 years in the face of repeated efforts to unionize it. In the case of four successive agreements his company had with the unions the unions violated them, and he declared that until the unions purge themselves of leaders who renounce their covenants his company will have nothing to do with them. Continuing he said:

"That same doctrine dominated the Emergency Fleet corporation in the Seattle strike. There, too, was an absolute breach of an agreement, solemnly signed; an agreement drawn up in the presence of the leaders of the Puget sound movement, breached three months before its expiration. Why? Because the leaders there were advised that by demonstrating their power they could win. They didn't win. Whether men are employes of the government or of private industries, if they breach an agreement they ought not to win.

"The fleet corporation took control and declined to have any conference with the men until they returned to work, and the fleet corporation resisted some very powerful political and social pressure to confer with the men. The men had had their hearing before a properly constituted board in accordance with their agreement. They were awarded less than they asked for, and they appealed to the appeal board provided in the agreement, and they lost before that. There was no opportunity for further compromise.

"Somewhere you must stop. You can't have a supersupreme court about the supreme court. That isn't democracy. We emphasized the principle there, and it was a very beneficent principle. It is a good doctrine because some employers are willing to compromise, even though a matter of principle is involved.

"The conditions under which labor should work were not developed by the fleet corporation. I accept my full share of responsibility for the things done by the corporation, but I accept no responsibility for the labor principles under which we were compelled to work. The principles involved practically permission to unionize plants that for years had been nonunion; and it involved the creation of shop committees.

"Most employers, recognizing that the administration had declared in favor of these principles, went wholeheartedly to work to carry them out as best they could, but I remember a case on the west coast in which the shipbuilder appointed a shop committee of three, which consisted of two sons and one nephew. That was hardly in the spirit of the agreement, and it came very near upsetting the entire industry in that district.

"I am not prepared to say that the shop committee is an entire solution of the difficulties that are likely to arise. Some one has said that perhaps it was a good thing the ten commandments were handed down direct, and did not come through a committee, because they might not have arrived yet.

Favors Reasonable Partnership

"I want partnership with our men, but recognize there are many ways of securing it. Partnership must be based on fairness and must involve acceptance of risk, as well as participation in profit. It must, therefore, be confined, in many cases in industry, to the immediate work which is under the control of the partner, and he must not be held responsible for the failure or success of policies or theories with which he had nothing to do. You can't make a partner of the man who is not responsible for the risk the partnership involves, and you can't expect a workman to sacrifice part of his income in such a partnership. You must confine his interest to the work under his control and give him part of the profits which extra effort or intelligence on his part bring about.

"My company has been paying on a production basis for many years and we have had no labor troubles. We try to keep step with the conditions, but we always adhere to the policy of paying on the basis of production. It is the only fair way; it is the way every man in business, from the top down, ought to be paid.

By-Product Plant

To be Built by Nova Scotia Steel Company—New Furnace Planned

Toronto, Ont., Sept. 22.—It is announced that the Nova Scotia Steel & Coal Co. will in the near future erect a by-product coke plant at its Sydney mines to cost over $2,000,000. This will necessitate a further enlargement of the present plant and the construction of an additional blast furnace, which will cost about $1,500,000.

The International Bushings Co., Ltd., has been incorporated, with head office in Toronto, and a capitalization of $25,000,000, to manufacture metals from ore to finished products.

It is understood the company will be largely a holding company, associated with the Pressed Metals Co., and will take over the latter's patent rights on bushings. It will control the output of bushings manufactured under these patents, and it plans for a large business with England, France and Germany. It is being financed in Toronto.

The company is making preparations to erect a plant in Port Huron to take care of large American contracts.

A conference was recently held between the directors of the Lake Huron Steel Corp. and the municipal officials of Goderich, Ont., as a result of which it is announced that the corporation will adhere to its original decision to establish its plant at Goderich. It receives a free site of 250 acres, and has asked for freedom from city taxes for 10 years. The company will use 14,000 horsepower of electrical energy at the outset and this may be increased to 20,000. It is estimated that 1500 men will be employed in construction, and that the maximum number of employes when the plant is working at full capacity will be 4000.

The employes of the Dominion Steel Corp., in Sydney, N. S., have petitioned the Canadian government to appoint a royal commission to inquire into the suspension of operations at the plant. The petition also asks the government to inquire into the profits made during the last five years and the amount of bona fide capital invested. It declares that no satisfaction can be obtained from the management as to when operations will be resumed, and that in view of the hardship to employes and the business interests of Sydney there is a necessity for immediate action by the government.

Steel companies in western Canada have amalgamated under the name of the Canadian Western Steel Corp., Ltd. The company will have in operation at an early date three rolling mills, located at Collingwood, Ont., Medicine Hat and Redcliffe, Alberta. A bolt and nut plant will also be established at Medicine Hat, and open-hearth furnaces will be built in Collingwood.

The Gurney Foundry Co. is about to increase its capital from $750,000 to $2,000,000 and a new issue of stock will be made.

Toolbuilders to Meet

On Oct. 15 and 16 the National Machine Tool Builders' association will hold its eighteenth annual convention at the Hotel Astor, New York City. The program is in course of preparation and soon will be mailed to the membership. Worcester, Mass., is the headquarters of the association this year, since President Albert E. Newton is vice president and general manager of the Reed-Prentice Co., that city, and association general manager is Charles E. Hildreth, president and general manager of the Whitcomb-Blaisdell Machine Tool Co., also of Worcester.

Will Hold Last Hearing

The National Screw Thread commission has returned from Europe where it held a number of conferences in England and France on the subject of international screw thread standards. The results of the conferences and other efforts of the commission, are requests from Great Britain and from France for further Anglo-American and Franco-American conferences for the purpose of arriving at an international standard for screw threads.

The last public hearing in America on national screw thread standards will occur on Monday, Oct. 6, at 10 a. m., in the Engineering Societies building, 29 West Thirty-ninth street, New York. The engineering bodies interested and the industries manufacturing and using screws will meet and give full and final consideration to the report.

The National Screw Thread commission was represented at the European conferences by the following: E. C. Peck, chairman, United States army; F. O. Wells, vice chairman, and L. D. Burlingame, American Society of Mechanical Engineers; E. Buckingham, H. L. Horning, Society of Automotive Engineers; J. O. Johnson, United States army; L. B. McBride, United States navy; H. C. Dickinson, United States department of commerce; and H. W. Bearce, United States bureau of standards, and Robert Lacy, United States army, technical secretaries.

Ore Tax Bill

Vetoed by Governor of Minnesota—Effort to Pass it Second Time Fails

St. Paul, Minn., Sept. 22.—The tonnage tax bill, introduced by Senator C. M. Bendixen, of Morgan, Minn., at the present special season of the legislature, was passed by a large majority in both houses and then vetoed by Governor Burnquist. It provides for a levy on the value of ores, to be collected from individuals, partnerships and corporations engaged in the production of ore. The tax would be placed only on the profits, and concerns operating on a bare margin would be exempt. The bill was introduced with the argument that the land from which the ore is being taken is constantly decreasing in value and in time will be practically worthless, while farming lands become more valuable.

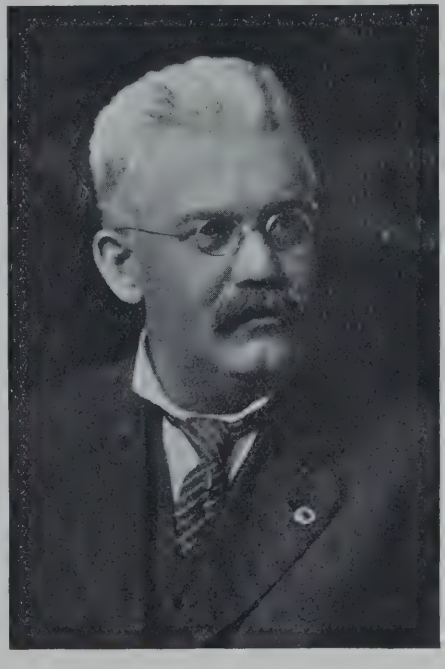
The proposal brought a storm of protest from the mining sections of the state and large delegations called upon the legislators in an effort to defeat it. Hundreds of telegrams were sent by citizens who declared the levy would cripple the range towns and drive thousands of workmen and their families to other fields. The governor in defending his veto declared that the ore land already is assessed 50 per cent higher than farm lands, and that while the land is decreasing in value the ore is continually being made into taxable objects. The executive maintained that if the profits in one enterprise are to be taxed profits in all industries also should be taxed. He stated that one of the fundamental principles of taxation lies in equality and that taxation should not be used as an instrument to impose unfair and excessive burdens on any particular class, industry or section.

Proponents of the measure profess to see in the governor's veto a victory for the nonpartisans and socialists whom, it is contended, have been furnished an argument in favor of their own principles of taxation. Members in both houses were bitter over the governor's action and a move was started to extend the session in an attempt to pass the bill over the veto. This effort was defeated.

Group insurance for its 600 employes, for amounts varying from $750 to $3000, depending upon length of service, has been contracted for by the Pittsburgh Iron & Steel Foundries Co., Pittsburgh. With each year's service with the company, $100 is added to the amount of insurance.

Obituaries

THEODORE O. VILTER, president of the Vilter Mfg. Co., Milwaukee, died Sept. 18 at his summer home in Pine Lake, Wis., aged 62 years. He had been in failing health for several months. He was chairman of the general committee in charge of the meeting of the American Foundrymen's association at Milwaukee in 1918, and had served as president of the Milwaukee Metal Trades association and also of a Wisconsin association of ice machinery manufacturers. He was born Oct. 25, 1857, at Oldenburg, Germany, coming to America while a schoolboy. At 17 he began to earn his living as a blacksmith's helper, later serving an apprenticeship as a machinist and became foreman of the shop. He was able a few years later to buy an interest in the company, known as the Weisel & Vilter Mfg. Co. In 1887 Mr. Vilter and his brothers bought out Mr. Weisel, enlarging the business, and changed the name to the Vilter Mfg. Co. He was a director of he National Foundrymen's association and the National Metal Trades association in addition to his Milwaukee connections.



Charles Mathias Jacobs, widely known English engineer and the designer of the McAdoo and Pennsylvania railroad tunnels under the Hudson river at New York, is dead at his home in London. He was 69 years old.

John McCaffrey, aged 73 years, died Monday at his home in Philadelphia. He formerly was vice president of the McCaffrey File Co., of that city of which his brother Hugh is head. Of late years he dealt in horseshoers' supplies.

Oliver Harold Lane, South American representative of the Hopedale Mfg. Co., Milford, Mass., for the past two years, died recently in Buenos Aires, aged 50 years. When 18 he went to work for the Draper Co. and for many years was private secretary to the late Gen. William F. Draper.

Otto A. Ruemelin, second vice president and works manager of Pawling & Harnischfeger Co., Milwaukee, manufacturer of cranes, hoists, monorail systems, etc., died in that city Sept. 1. His association with the Pawling & Harnischfeger Co., extended over a period of 30 years, beginning as an aprentice. After several years as a journeyman machinist, Mr. Ruemelin was promoted successively to the foremanship of various departments. Later he became assistant superintendent and then superintendent. In 1912, he was made works manager, and later was elected second vice president.

A. L. Dunning, Ravenna, O., who was believed to be the first American manager of a bessemer steel plant, died recently in that city. He took charge of the Cleveland Mill Co., Newburg, in 1867 after it had been shut down because of inability to agree with the two Englishmen who had been running it.

THEODORE O. VILTER

Col. William W. Castle, former appraiser of machinery at the Boston custom house, died Sept. 15 at his home in Weymouth, Mass., aged 76 years. He was born in Cleveland, Sept. 21, 1843, the son of the president and principal owner of the Cuyahoga Works. He came to New England in 1872 and bought the Belfast Foundry & Machine Co., Belfast, Me., which was destroyed by fire in 1873.

James Robert Fletcher, factory manager of the P. & F. Corbin division of the American Hardware Corp., New Britain, Conn., died while undergoing an operation at his home in that city, Sept. 14, aged 52 years. He had been connected with the division 12 years, coming from the Yale & Towne Mfg. Co., Stamford, Conn., as assistant to the superintendent. On the resignation of William T. Hartman, he became superintendent, afterwards being promoted to be factory manager. He was a member of the American Society of Mechanical Engineers.

John Richard Kidston Law, chairman of William Jacks & Co., Ltd., 19 Saint Vincent place, Glasgow, Scotland, iron and steel merchants, aged 62 died Aug. 29, following a slight hemorrhage of the brain, suffered three weeks previously. Early in life, Mr. Law was a tea planter in Ceylon but in 1890, he became associated in business with the late William Jacks and his brother, Bonar Law, and upon the death of Mr. Jacks, Mr. Law became senior partner, Bonar Law having retired some time before. His chief interest was in scientific subjects of which he possessed a wide and accurate knowledge. He also was an inventor and a mechanical tea roller which he produced now is used widely in Ceylon and India. At the time of his seizure he was engaged on the invention of a new type of engine.

W. Cromwell Gurney, aged 46, president and general manager of the Gurney Foundry Co., Toronto, Ont., was overcome by an attack of heart trouble Sept. 17, and died within a few minutes. He was prominent in business circles and was the eldest son of the late Edward Gurney, founder of the Gurney Foundry Co. Since the death of his father he has managed the company. Mr. Gurney was born and educated in Toronto, and had been connected with the Gurney Foundry Co. since the time he entered upon commercial activities.

Sheet Wage Unchanged

The present rate of wages paid for rolling sheets will be continued for the next two months as a result of the bimonthly settlement made in Youngstown, O., Sept. 11, at a conference between James H. Nutt, secretary of the millowners' association, and representatives of the Amalgamated Association of Iron, Steel and Tin Workers. This settlement follows the lines of the settlement with the puddlers announced Aug. 28 at which time the rate was unchanged, being based on a 2.50c bar iron card in force the previous 60 days.

Many File Views In Basing Case

Producers and Consumers of Steel Present Variety of Arguments on Question of Single Price Base—South Presents Claims for Birmingham Base—Say Change Would Favor Steel Corporation

NUMEROUS written arguments both favorable and opposed to the Pittsburgh basing point on iron and steel prices which have been filed with the federal trade commission by producers and consumers in all parts of the country testify to the far-reaching importance that is attached to this question by industry in general. The names of those companies which had filed declarations in this matter were published in the Sept. 11 issue of THE IRON TRADE REVIEW. These documents and communications have advanced many interesting and original points bearing upon the general subject. Consumers of steel in the south especially have been active in bringing their viewpoint to the attention of the commission, and in furtherance of their claims of Birmingham as a proper basing point.

An important aspect of the question has been raised through the statements presented by independent steel producers who do not have mills in the Chicago district. One of the most prominent and comprehensive of these is that filed by the Bethlehem Steel Co., which is published in large part below, together with the statements of record made by various other producers and consumers of steel.

Says Chicago Prices Depend On Pittsburgh

BY E. G. GRACE, PRESIDENT,
Bethlehem Steel Co.

THE question presented by the petition herein affects the following three classes of manufacturers of iron and steel:

(a) Those whose only mills are in the Chicago district, such as Inland Steel Co., Interstate Iron & Steel Co. and Steel & Tube Company of America which are named as respondents in the petition;

(b) Those whose only mills are in the Pittsburgh district or in other districts east of the Chicago district, such as Jones & Laughlin Steel Co., Bethlehem Steel Co., Cambria Steel Co., Lackawanna Steel Co. and Republic Iron & Steel Co.; and

(c) Those which have mills in both the Pittsburgh district and the Chicago district or which have subsidiaries that have mills in the Pittsburgh district and other subsidiaries that have mills in the Chicago district. United States Steel Corp. seems to be the only company coming within this class.

This statement is prepared from the point of view of the manufacturers of class *(b)*, that is, those who do not have mills in the Chicago district.

I. The use of the so-called "Pittsburgh base" is simply a convenient method of quoting prices and the abolishing of that base or the establishing of other bases would not affect prices but would cause confusion and inconvenience in the steel industry.

There seems to be a great deal of confusion of thought with the petitioner herein about the purpose and effect of the use of the so-called "Pittsburgh base" in connection with the prices of steel and iron. As a matter of fact the use of the Pittsburgh base has nothing whatever to do with, and has no influence upon, the prices which manufacturers of steel charge for their products. It is simply a convenient method of quoting prices—convenient to both the manufacturer and the purchaser. Its use in no way affects the freedom of each manufacturer to make any price he chooses in any territory.

In using the Pittsburgh base in quoting prices the manufacturer simply states to a prospective customer in a given territory in effect that the price of the product offered is so many dollars per ton plus an amount equal to the freight between Pittsburgh and the point of delivery. The use of this base gives precisely the same result to customers as if each manufacturer were to quote prices f.o.b. the point of delivery or f.o.b. mill, because in any case the ultimate price would be computed on the basis of the price at the mill plus freight to the point of delivery. The objection to quoting prices f.o.b. the point of delivery is that manufacturers would have to make extended computations based on varying freight rates. The objection to quoting prices f.o.b. mill is that similar computations would have to be made by the customers before they would be able to compare quotations. With the use of the Pittsburgh base, however, manufacturers can readily make quotations, and customers can compare with equal ease the quotations of different manufacturers, since the freight from Pittsburgh to a given point is the same for each customer.

Manifestly, if a manufacturer in the Pittsburgh district wishes to make a low price for delivery in the Chicago district in order to take the business from the mills in that district, all he has to do is to make a low price f.o.b. Pittsburgh. His freedom to make a low price is just as great when the price consists of a price at Pittsburgh and the freight to the point of delivery has to be added as when it consists of a price at the point of delivery in which the freight is included although not shown as a separate item.

If the use of the Pittsburgh base in quoting prices were abolished, prices paid by the customers would, upon the last analysis, be made up in just the same manner as before; that is, in every case they would include two elements—the price which the manufacturer fixes for his product at his mill and the freight to the point of delivery.

The charge that the use of the Pittsburgh base in quoting prices is the result of a combination or understanding between steel manufacturers hardly calls for serious consideration. Bethlehem Steel Co. does not have any agreement or understanding amounting to an agreement with any one or more of the respondents named in the petition herein, or with any other producer of steel, for or covering discriminations in price between purchasers of rolled steel in the Pittsburgh district or elsewhere or for the maintenance of prices of rolled steel in and throughout the Chicago district to members of the petitioner herein or to other consumers in such district; nor does it believe that any such agreement or understanding between said respondents, or any of them, or between any of them and any other producer or producers of steel exists.

The Pittsburgh base has been used in quoting prices almost from the beginning of the steel trade in this country and is thoroughly understood by both manufacturers and purchasers. It is a matter of common knowledge that the custom of quoting prices f.o.b. Pittsburgh was established more than half a century ago when practically all the steel of the country was manufactured at Pittsburgh. It has been continued to the present time by force of habit and custom as well as because of its convenience to all concerned, notwithstanding the development of new centers for the manufacture of steel at Chicago and elsewhere. It fits present conditions because in normal times the Pittsburgh district is still the largest producer of iron and steel in the country.

It is, therefore, submitted that to forbid the use of the Pittsburgh base in quoting prices for steel and iron prod-

ucts would result merely in great inconvenience to the steel trade, not only to manufacturers but to purchasers, and would benefit no one.

II. The real question raised by the petition is whether it is unlawful for a manufacturer who has mills in both the Chicago district and the Pittsburgh district to sell the products of his Chicago mills in the Chicago district at prices higher than those at which he sells the products of his Pittsburgh mills in the Pittsburgh district, although the cost of the products in both districts is the same.

As we understand the petition and the matters complained of, the real question raised is not the propriety of using the Pittsburgh base in quoting prices for rolled steel products, but is found in the charge that the respondents discriminate in the price of such products in favor of competitors of members of the petitioner herein who are located in the Pittsburgh district or the territory east of the Chicago district and against such members and other consumers of rolled steel products located in the Chicago district, in violation of Section 2 of the Clayton act, it being asserted that the effect of such discrimination may be substantially to lessen competition or tend to create a monopoly in the particular line of commerce. We do not believe that respondents Inland Steel Co., Interstate Iron & Steel Co. and Steel & Tube Company of America, which have mills only in the Chicago district, quote different prices to different purchasers within any given district which come within the prohibition of such Section 2, although such prices may be the cost of the production of the product plus freight from Pittsburgh to the point of destination. If this be so, then the charge applies only to United States Steel Corp. (assuming, as charged, that its subsidiaries Illinois Steel Co. and Carnegie Steel Co. act under its direction and control) because its subsidiaries in the Chicago district sell the products of their mills to consumers in that district at prices higher than is charged for the products of its subsidiaries in the Pittsburgh district to consumers in the Pittsburgh district, although, as is alleged, the cost of production is no greater in the Chicago district than in the Pittsburgh district.

It is apparent that his charge against United States Steel Corp. in no way involves the propriety of the use of the Pittsburgh base in quoting prices, because the result would be the same whether the price charged in the Chicago district were *(a)* the price charged in the Pittsburgh district plus $5, as the freight from Pittsburgh to Chicago, or *(b)* a price $5 a ton higher than the price for the same product in the Pittsburgh district. The resulting price to the consumer would be the same in either case.

We are, therefore, brought face to face with the question whether the practice of United States Steel Corp. (treating the matter as if it owned and operated the mills of its subsidiaries) in charging higher prices for its products in the Chicago district than it charges in the Pittsburgh district is in violation of Section 2 of the Clayton act. For the reasons stated in Subdivision V hereof, the decision of this question will vitally affect the steel manufacturers whose mills are in other districts and the steel trade and business generally.

III. If the practice complained of be declared a violation of Section 2 of the Clayton act the effect would be to prevent a manufacturer from taking advantage of the favorable location of his mills with respect to his competitors and the operation of the law of supply and demand, to fix prices and to restrain rather than promote competition.

It seems too clear for argument that a manufacturer whose only mill is in the Chicago district is free to charge any price he can obtain under the competitive conditions prevailing in that district, even though his profit be larger than that of the manufacturer in the Pittsburgh district who sells his product in that district or in the Chicago district; provided, of course, that the effect of any discrimination in price (if it shall not be within the exceptions stated in Section 2 of the Clayton act) may not be substantially to lessen competition or tend to create a monopoly. Presumably the purpose of the manufacturer in locating his mill in the Chicago district was to gain an advantage over the manufacturer whose mills were located in the Pittsburgh district or elsewhere at a considerable distance from Chicago and who in making prices for the Chicago district has to consider the item of freight.

It is equally clear that the manufacturer whose mill is in the Pittsburgh district is free to make any price that may be necessary to effect the sale of his products in the Chicago district under the competitive conditions prevailing in that district, even though that price, less the freight from Pittsburgh to Chicago, be lower than his Pittsburgh price, because the effect of such sales can hardly be to lessen competition or to tend to create a monopoly. He is certainly free to make any reduction in price necessary to meet the competition of the manufacturers of the Chicago district; otherwise, there would be a restriction of competition and the manufacturers having mills in the Chicago district would have an unfair advantage.

The same results should follow in the case of a manufacturer who has plants in both the Pittsburgh district and the Chicago district. Such manufacturer should be free to secure for the products of his mill in the Chicago district the best prices obtainable under the competitive conditions in that district, even though the products of his mill in the Chicago district are sold at higher prices and at a better profit than the products of his Pittsburgh mills marketed in the Pittsburgh district.

If United States Steel Corp. can get a higher price in the Chicago district for the products of its mills in the Chicago district than for the products of its mills in the Pittsburgh district, it is not because of the Pittsburgh base, but because competitive conditions make the higher price possible. The fact is that the mills in the Chicago district do not supply even one-half of the steel consumed in that district. The remainder must come from the mills outside of that district, chiefly those in the Pittsburgh district, the cost of the products of which to consumers in the Chicago district must of necessity include the freight from the mills to the point of delivery in the Chicago district. Therefore, in normal times the prices charged by the manufacturers in the Pittsburgh district for their products delivered in the Chicago district will necessarily control prices in the Chicago district, even though the result may be that the manufacturers in the Chicago district make a larger profit upon their product than is made by those in the Pittsburgh district.

If the time shall ever come when the mills in the Chicago district have sufficient capacity to supply all the needs of that district and can continue to manufacture as cheaply as the mills of the Pittsburgh district, then the owners of the mills in the Chicago district, in normal times, will naturally have the trade of that district to themselves and the owners of the other mills will be excluded from competition.

It thus appears that the difficulty which the Chicago district fabricators experience in doing business outside of their own territory is due not to the effect of the use of the Pittsburgh base in quoting prices or to any discrimination in price on the part of the manufacturers against the Chicago district, but to the fact that their fabricating plants are located in the Chicago district, which does not produce enough steel to supply their demands, and the fact that steel shipped from Pittsburgh (from which a very large part of the steel consumed in the Chicago district must come) costs in the Chicago district several dollars more per ton to the manufacturers than steel produced at mills in the Chicago district. Such fabricators are able to compete in the Chicago district on somewhat better than equal terms with the eastern fabricators, because the freight rate paid by the eastern fabricators upon their finished product from their mills to points in the Chicago district is higher than the freight rate paid by the Chicago fabricators on the steel which enters into their finished product.

IV. What the members of the petitioner desire is a fixing of prices which will result in enlarging their field of competition and narrowing the field of competition of their competitors—this without reference to the effect upon competition generally.

In the last analysis what the Chicago fabricators are seeking is not to secure relief from a discrimination in price against them, but to secure a discrimination in price in their favor, so that they may be able to enlarge their territory and overcome the handicap now resulting from the fact that the price of steel is higher in Chicago than in Pittsburgh —a handicap which, as has been already pointed out, is due solely to competitive conditions and not to any arbitrary fixing of prices by the manufacturers or to discrimination. A fabricator in St. Louis, where there is no steel mill, might with equal justice complain of his inability to compete with the Chicago fabricator because the cost of his fabricated steel to the Chicago consumer would necessarily be increased by the freight from St. Louis to Chicago.

The members of the petitioner obviously desire to be able to buy at the Pittsburgh price all the steel produced in the Chicago district, and to buy from the Pittsburgh district at the Pittsburgh price, plus freight, enough additional steel to meet their demands. As the freight rate on rolled steel is less than that on fabricated steel, it would be impossible for Pittsburgh fabricators to compete in the Chicago district at all. The members of the petitioner, on the contrary, would then have, not only a

protective tariff amounting to the difference between the freight rate on rolled steel and that on fabricated steel, but also, to the extent that they could purchase rolled steel in the Chicago district at the Pittsburgh price, a protective tariff amounting to the entire freight rate on fabricated steel from Pittsburgh to Chicago. They would thus be able to establish a complete monopoly in their district, and it may well be questioned whether they would not resist any attempt to restrict their selling price to cost plus a reasonable profit.

If United States Steel Corp. were forbidden to sell in the Chicago district the output of its mills in that district at a price higher than that at which it sells in the Pittsburgh district the output of its mills in that district, or, to put it more positively and concretely, were required to sell in the Chicago district the products of its mills in that district at a price not to exceed cost plus a reasonable profit, the result to the members of the petitioner would not be what they seek. What the result would be would depend on where United States Steel Corp. sold the products of its mills in the Chicago district. If it chose to sell those products to consumers outside of the Chicago district the condition complained of would continue or would perhaps be made worse. If it chose to sell to consumers in the Chicago district the effect would be to lessen competition. The other manufacturers in the Chicago district would not find it necessary to lower their prices until the capacity of the mills of United States Steel Corp. in the Chicago district should be increased so that their products would be sufficiently substantially to meet the demand of that district, for they could continue with their existing prices to compete successfully with the manufacturers in the Pittsburgh district and other districts east of the Chicago district. Until such mills had so increased their capacity, competition between fabricators in the Chicago district would be very much disturbed and confused, if not substantially lessened: first, because only favored fabricators would get the lower priced steel, with the result that instead of all the fabricators being in competition for construction work in the Chicago district, they would be divided into two classes, the favored fabricators and the others, the second of which could not compete with the other; and secondly, because, with the price of steel in the Chicago district fixed lower than the law of supply and demand requires, the tendency would be to prevent the manufacturers (other than United States Steel Corp.) whose mills are outside of the Chicago district and who now compete with the manufacturers whose mills are located in the Chicago district from continuing to bid for the Chicago business. By reason of this shrinkage in their source of supply, the fabricators in the Chicago district would find that their field of competition was a correspondingly more restricted one and that such increased restriction would continue, at least until the supply of the mills of United States Steel Corp. in the Chicago district had been exhausted.

Even if all the manufacturers in the Chicago district could be required to sell at the lower price, it is apparent that in normal times the same unfavorable conditions would obtain. Although the confusion at such times might be somewhat less, it would still exist and not only the fabricators but the ultimate consumers, *i. e.*, the owners, would experience unnatural and unfair results. One owner putting up a building, whether for purposes of sale or rent, would necessarily have to pay more for his building than another because the one would have to pay more for his steel than the other. The latter will have been artificially favored.

It is submitted that the law of supply and demand should not be disturbed and that the incentive to invest money in steel mills in the Chicago district should not be diminished. The policy of our laws has been to allow the law of supply and demand the fullest play and to protect its operation from the interference of artificial influences. The petition herein seeks to disturb it and we believe that injury is bound to result.

V. Why steel producers generally are interested in the decision of the question involved.

The question may be asked why the steel manufacturer whose only mills are in the Pittsburgh district or elsewhere outside of the Chicago district is interested in the question involved herein, inasmuch as the granting of the relief sought would affect only United States Steel Corp., which through its subsidiaries, has mills in both the Pittsburgh and Chicago districts. The answer is simple. The mills of manufacturers of iron and steel have been located at the particular places because their owners have seen some advantage in locating them there. This advantage may be because of nearness to the ore or coal supply, or because of favorable transportation rates on raw material or finished products, or because the supply of finished products manufactured in a particular district was small compared with the demand therefor. Undoubtedly most of these reasons caused the owners of the mills in the Chicago district to locate them there. A prohibition against taking advantage of a favorable location could not be limited to United States Steel Corp. in respect of the mills of its subsidiaries in the Chicago district, and if it should be decided that none of the manufacturers in that district can be allowed to take advantage of their favorable location or, in other words, that the operation of the law of supply and demand must be restricted, then similar applications by consumers of steel in other districts would inevitably follow with similar decisions, and similar confusion and disturbance would result all over the country.

This precedent, once established, could not be limited in its application to manufacturers of iron and steel, but, on applications which would surely be made by consumers of other products, would necessarily have to be applied to other manufacturers, with the result that the natural laws upon which business has been founded since the beginning of civilization would be upset. The effect of such a decision would be far reaching. The advantages which induce investments in plants being negatived, loss of such investments to a considerable extent at least would follow and business chaos might well be expected.

The effect of the application of such a precedent upon the structure of the freight rates of the country should also be considered. That structure has been built up with a view to promoting competition by equalizing competitive conditions to the largest extent consistent with the interests of the carriers. If the principle upon which the granting of the relief sought by the petitioner herein must be based were logically applied to all the business of the country, a readjustment of freight rates would necessarily follow and the confusion mentioned above would be greatly increased.

We sincerely trust that this commission will not venture even a short way upon such a course, but will promptly decide that the business success of the country requires that the freest play be given to the law of supply and demand and will, therefore, dismiss the application herein.

Change Would Help Corporation

BY F. W. BEACH, GENERAL MANAGER OF SALES,
Mansfield Sheet & Tin Plate Co., Mansfield, O.

THE practice of using Pittsburgh as a basing point on all iron and steel shipments may possibly not be defended as a strictly logical principle, yet the custom dates back to the time when the industry really started in Pittsburgh. No doubt at all, that was the cheapest point of production and the cheapest point for the assembling of raw material, hence the cheapest place for production.

If the iron and steel industry should discontinue the use of Pittsburgh as a basing point, there is no logical reason why every community in the United States where iron and steel are produced should not be made a separate basing point.

If only the Chicago district were concerned, then a solution might be found. It requires no prescience to conclude that other regions such as Birmingham, Ala., Pueblo, Colo., Cleveland, Youngstown, O. (and the entire Mahoning valley), many other points in the state of Ohio, Philadelphia, Duluth, Minn., Wheeling, W. Va., Buffalo, N. Y., the New England section, and others will set forth claims for basing points. This would certainly bring about a very chaotic condition. Skilled labor on sheet and tin mills are compensated upon a sliding scale basis, as an example, when the price of sheet steel advances 5 cents per 100 pounds, the men's wages automatically advance 2½ per cent, and reductions accordingly. Therefore, the wages of the thousands of men employed by the industry are standardized, and if each locality should have a different basing point, you will readily see that it will be the means of bringing about a condition which will dissatisfy these men. The consuming trade have established their business to meet the existing conditions, and any radical changes would certainly disturb all relations with the mills, as well as with all of the buyers. The ultimate result would be that every producer and

consumer would be largely limited to their own particular zones, thus cut off largely from other centers by freight rates. In our own case, assuming Chicago as a basing point, we could not absorb the freight from Mansfield to Chicago district without loss. The establishment of Chicago as a basing point would certainly act as a hardship to every independent manufacturer of steel, and the only company who would have any advantages under such conditions would be the United States Steel Corp., with its many subsidiary companies scattered in practically all of the abovementioned centers. *This in itself is reason enough for not disturbing the present arrangement.* While theoretically every community should enjoy the advantages and suffer the disadvantages of its natural geographical location, other industries not having been established upon this basis, the question becomes one of weighing the advantages which would be derived from a change against the disturbance which would result, especially at a time when the industries are faced with a solution of many disturbing factors resulting from war conditions.

Your commission, no doubt, will find this to be a more complicated matter to determine, what you must avoid doing than to determine what you ought to do if the way were clear. Almost anything you might be disposed to do would be likely to involve you in something else. For instance, if you should order Chicago district mills to sell f.o.b. Chicago at f.o.b. Pittsburgh price, you will be ordering one mill to sell at another mill's price. It might be difficult to draw a line and avoid, in substance, ordering one Pittsburgh mill to sell at another Pittsburgh mill's price. Eventually your commission would be fixing prices for the entire iron and steel industry. If there were deviations, whom would the commission punish, those who sold below the set price, or those who exacted a higher price?

Should the decision merely be that a mill must not quote on a remote basis, but only f.o.b. the respective mill, there would be a change in form, but not in substance. The mills would take the Pittsburgh price, add the freight to destination point, deduct the freight from its mill, and quote the resulting price at the mill.

Summing up the entire situation, no one is now injured when buying on one common basing point, viz., f.o.b. Pittsburgh, why change? It seems advisable to leave well enough alone, making no attempt to destroy or change the present established market center of the country.

Southern Consumers Opposed

TOMLIN-HARRIS MACHINERY CO.,

Cordel, Ga.

THE application of the Western Association of Rolled Steel Consumers for a complaint against the United States Steel Corp., and others, should in our opinion be granted to the Chicago district, and territory tributary thereto, and not only should this be done, but the Birmingham district, and territory tributary thereto should be included, for as we understand it, Judge Gary and Mr. Schwab of the United States Steel Corp. have stated that steel could be produced as cheaply or cheaper in the Birmingham district than in any other place in the United States, and this being true, it is unduly prejudicial to the western and southern consumers of steel articles to pay a price for these articles based on the Pittsburgh price plus freight from Pittsburgh to destination, while the freight from Birmingham to destination might be and in all instances in the south, are considerably lower.

ATHENS FOUNDRY MACHINE WORKS,

Athens, Ga.

IN READING the application of the Western Association of Rolled Steel Consumers for complaint against the United States Steel Corp., and others, we feel that a great injustice is being done the manufacturers of the south in that we have to base our prices on Pittsburgh instead of some southern point. Wherein if the South could have a basing point say at Birmingham, Ala., and the West at Chicago we would save $6.20 per ton which would then allow us to compete with eastern manufacturers not only in our own city but would allow us to reach out into other fields.

As it now stands with Pittsburgh as a basing point we cannot compete with the eastern manufacturers in our own city due solely to the difference in base price which is based on Pittsburgh at a difference of freight rate of $6.20 per ton.

We are a small concern and would use only about 100 tons per year but the difference between prices being based on Birmingham, Ala., and based on Pittsburgh freight rates would be enough to pay 5 per cent on our capital.

We feel that your commission should grant the application and should establish at least three basing points for rolled steel, say one at Pittsburgh for the east and north, one at Chicago for the west and north and one at Birmingham for the south and west.

BRUNSWICK MARINE CONSTRUCTION CO.,

Brunswick, Ga.

WE HEARTILY endorse the complaint of the West Association of Rolled Steel Consumers. We use a large quantity of steel both for general manufacturing purposes and for steel shipbuilding. In competition with concerns located in eastern territory for the sale of manufactured articles, you can readily see that they can sell in our territory at a lower price than we can sell in theirs, because, while we receive our steel from Birmingham, from which point the freight rate to Brunswick is only 25 cents per 100 pounds, we pay the rate from Pittsburgh, which is 59 cents, whereas, the northern and eastern manufacturer, who actually receives his steel from the Pittsburgh district, pays only the actual freight rate from that point.

The same situation exists in connection with steel shipbuilding. Our steel plates come direct from Birmingham, from which point the freight rate of 25 cents to Brunswick is practically the same as the rate from Pittsburgh to shipbuilding points on the Delaware river. Yet instead of paying the actual rate, we are charged 59 cents per 100 pounds, on the theoretical Pittsburgh basis—or more than twice the freight rate that our northern competitors pay.

After looking into the situation, the federal trade commission will see that the present condition is unjust to the South as a whole, and we hope will have such measures adopted as will render it unnecessary for the southern rolled stock consumer to pay more than the actual freight rate from point of shipment.

SOUTHERN BRIDGE CO.,

Birmingham

AT present we obtain a certain proportion of our rolled steel shapes, say 60 per cent or greater, from local mills in this district, on which we pay at the rate of Pittsburgh base plus $3 per ton.

In competition with fabricators from the Pittsburgh territory to points north we are thus placed at a disadvantage, for, assuming that our costs of fabrication are the same as that of fabricators in the Pittsburgh district, we are handicapped in the sum of $3 per ton in bidding on fabricated steel work to points that carry an equal freight rate between this city and Pittsburgh.

Upholds Base

BY L. E. THOMAS, PRESIDENT,

Reading Iron Co., Reading, Pa.

IN reference to the complaint received by your honorable commission from the Western Association of Rolled Steel Consumers, regarding the discontinuance of Pittsburgh as a basing point, I beg to advise that the continuance of this practice is of vital importance to this company.

The raw material consumed by us in the manufacture of our product, which consists of wrought iron pipe and tubing, comes almost exclusively from the coal regions of western Pennsylvania, and the ore mines of the lake regions, placing us at a distinct disadvantage with our principal competitors, all of whom are located in the Pittsburgh district. Furthermore, 75 per cent and upwards of our finished product is shipped to the west and southwest, passing through Pittsburgh, placing us at a further disadvantage in the matter of freight in the distribution of our product, as compared with our competitors.

The machinists' union representing toolmakers and skilled hands in all of the greater Boston districts held a meeting recently and decided upon a new wage scale, providing for 90 cents an hour, together with a 44-hour week.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

HORTON PENROSE, general manager of Shimer & Co., Philadelphia, Pittsburgh, and San Francisco, has resigned and will give his entire attention to the Penmore Fuel & Iron Co., in which he has been interested for some time. Mr. Penrose was resident manager in the Pittsburgh district for Shimer & Co. for several years, relinquishing this position to become general manager a little more than a year ago. He has been connected with the iron and steel business for the past 15 years, having previously been connected with the traffic department of the Baltimore & Ohio railroad. Ferdinand G. Schultz has resigned as Pittsburgh district sales manager for Shimer & Co., effective Oct. 1. Mr. Schultz has no definite plans as to future activities after that date.

John Blume formerly with the Holt Mfg. Co., Peoria, Ill., has been made assistant foundry superintendent for the Avery Co., Peoria.

C. Sinclair Weeks and A. Stanley North have been elected assistant cashiers of the First National Bank of Boston.

Charles F. Pace has been made district sales manager of the Hutchins Car Roofing Co., Chicago, and has opened offices in the Railway Exchange building, St. Louis.

L. R. Custer, formerly development engineer for the Midvale Steel & Ordnance Co., recently was elected vice president of the Cambria Steel Co.

George W. Bender, district manager at the New York office of Mudge & Co., Chicago, has been made manager of sales and service with headquarters in Chicago.

L. E. Purnell recently has been made district manager at Cleveland for the Ajax Metal Co., Philadelphia. The new offices of the company are in the Schofield building, Cleveland.

V. L. Curran has resigned as purchasing agent of the Sparks-Withington Co., Jackson, Mich., to become general manager of the Jackson Screw Products Co., that city. He has been succeeded by James T. Beadle.

John C. Moran, for the past year purchasing agent for the Lord Construction Co., Providence, R. I., has been appointed naturalization examiner for the district of Rhode Island.

E. M. Champion, former factory manager of the Bay City, Mich., plant of the C. R. Wilson Body Co., has been appointed factory manager in charge of production of the main plant in Detroit.

John C. Craig, formerly assistant superintendent, recently became superintendent of the rolling mills of the Steelton, Pa., works of the Bethlehem Steel Co., succeeding W. W. Leck, resigned.

Frank B. Roth, formery president of the Philadelphia chapter of the American Association of Engineers has been made chief engineer of the Lehigh Structural Steel Co., Allentown, Pa.

Auguste Griffoul who for the past few years has been foreman of the brass foundry department of Babcock & Wilcox Co., Barberton, O., has accepted a position as superintendent of foundries for the Flour City Ornamental Iron Co., Minneapolis.

Herbert DuPuy, chairman of the board of directors of the Crucible Steel Co. of America, who recently underwent an operation at the French hospital in New York City, is reported to be making good progress toward recovery.

H. Earl Sweitzer has been made sales manager in charge of sales and advertising, of the Allsteelequip Co., Aurora, Ill. For about one year he has been assistant sales manager and prior to that time was advertising manager of the Appleton Mfg. Co., Batavia, Ill., for several years.

G. H. Dorr, Washington, assistant director of munitions, who, since the signing of the armistice has been in charge of the work of cancellation of contracts, has resigned and will resume the practice of law in New York. His successor has not been named.

Joel B. Ives, of the engineering and contracting departments of the American Steel Export Co., New York City, has sailed for Italy. He will confer with the export company's agent, M. Ferraris & Co., on matters referring to the Italian market for steel and metal products including machinery and equipment.

W. Edward Lindsay has been made engineer for the Lancaster Structural & Foundry Works, Lancaster, Pa., which company has purchased the property of the Lancaster Machine & Structural Works. Edgar G. Hess, formerly connected with the Lancaster Foundry Co., has been made works manager of the Lancaster Structural & Foundry Works.

Ray M. Cheney who has been with the Badger Co., Boston for the past two years, has resigned to take charge of a foundry near Calcutta, India, for the Bemis Brothers Bag Co., Boston. The Bemis Brothers company has a large jute textile mill in India for which they propose to construct all required machinery in that country, owing to the high importing costs.

E. Phelps Langworthy, formerly assistant works manager of the American Steel Foundry, Indiana Harbor, Ind., has been made manager of the steel castings plant of the American Radiator Co., Buffalo. G. W. Merrefield, formerly with the Clark Equipment Co., Buchanan, Mich., has been appointed assistant to Mr. Langworthy and will have charge of sales.

Donald H. C. Tulloch, former secretary of Boston branch, National Metal Trades association, has been elected secretary of the Manufacturers association of Jackson, Mich. He resigned his Boston position to enter the service and was commissioned a lieutenant in the C. A. C. Before going to Boston he was secretary of the Employers' association of Berkshire county, Mass., with headquarters in Pittsfield.

E. M. Mentzer has been promoted to be manager of the tin plate plant of the Weirton Steel Co., Weirton, W. Va., succeeding J. C. Griffin, who resigned recently to become affiliated with the Bethlehem Steel Co. Mr. Mentzer formerly was manager of the Weirton company's tin plate plant at Steubenville, O., in which capacity he is succeeded by W. F. Singer, formerly assistant to J. C. Williams, general manager of the Weirton Steel Co.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

G P. GOODMAN, who for several years has represented the Hisey-Wolf Machine Co., Cincinnati, in the east, will on Oct. 1, take charge of the portable tool department of F. H. Niles & Co., Inc., New York City. This company handles not only the Hisey-Wolf line of electric machine tools but the pneumatic hammers and drills manufactured by the Pittsburgh Pneumatic Co. Other changes in the Niles company are the appointment of F. H. Crawford as secretary and J. E. Haetten as sales manager.

Anthony Dobson has been placed in charge of a newly established Detroit branch office of the Carborundum Co., Niagara Falls, N. Y.

S. S. Newton recently resigned as president and director of the Luther Grinder Mfg. Co., Milwaukee, after 18 years of service. He is succeeded by W. T. Hardy.

Jay V. Hall, former general sales manager of the Olds Motor Works, Lansing, Mich., has joined the executive staff of the Willys Corp. at its Duesenberg plant.

David H. G. Penny, vice president, in charge of the foreign department of the National Bank of Commerce, New York, sailed for Europe, Sept. 18, to confer with the foreign representatives of the bank.

Carl F. Dietz, vice president and sales manager of the Norton Co., Worcester, Mass., is to sail the latter part of the month on a European trip that will keep him away until about the first of the year. He is to establish new sales agencies in several foreign countries.

Otto J. Lof, for several years representative in Germany of the Norton Co., Worcester, Mass., who returned a few months ago after having been interned during the war, has sailed for Europe, having been assigned a new district, comprising Norway, Sweden and Denmark.

Jesse G. Vincent, vice president of the Packard Motor Car Co., Detroit, has been commissioned a colonel in the United States officers' reserve corps aviation section of the signal corps in recognition of valuable services rendered the war department in perfection of the Liberty motor.

W. C. Irwin has been made district sales representative for St. Louis and the southwest, with headquarters in the Frisco building, St. Louis, for the Dunbar Mfg. Co., of Chicago.

M. W. Seeman, sales engineer of the Cleveland Osborn Mfg. Co., Cleveland, has been appointed director of European sales of this company with headquarters in London. Mr. Seeman will promote the sale of the extensive line of molding machines manufactured by the Cleveland Osborn Mfg. Co. throughout Europe.

Henry J. Gross, formerly vice president and general manager of the Norcross Bros. Co., Worcester, Mass., is now vice president and treasurer of the recently amalgamated building firm of Anglin-Norcross, Ltd., Montreal. It has taken over the Canadian interests of the Norcross Bros. Co., which is liquidating its affairs.

Dr. George C. Barlow resigned recently as president of the United States Tractor & Machinery Co., Menasha, Wis., due to poor health. Joseph G. Sailor, formerly president of the Sailor-Whitmore Machine Co., that city, who has been vice president of the United States company for some time succeeds him as president.

A. A. Gloetzner has been elected president and general manager of the Covert Gear Co., Inc., Detroit, succeeding P. A. Clum as president. Since early this year he has been vice president and prior to that he was chief engineer and manager of sales. He will make his headquarters in the Lockport, N. Y., office of the company, spending two days weekly in Detroit.

Henry Blanchard, sales representative at Chicago for the Baldwin Locomotive Works and the Standard Steel Works Co., has been made manager of a branch sales office in the Merchants National Bank building, St. Paul, Minn.

Walter E. Flanders, of Detroit, who recently resigned as head of the Maxwell Motor Co., has become identified with the L. D. Rockwell Co., manufacturers' agents for the Precision Die Casting Co., Dahlstrom Metallic Door Co., Delaware Seamless Steel Tube Co., American Tube & Stamping Co., Donner Steel Co., and other firms, with offices in the Book building, Detroit. Mr. Rockwell was formerly with the Standard Welding Co.

George W. Crane now is president of the Seneca Falls Mfg. Co., Inc., Seneca Falls, N. Y., builder of lathes, etc., succeeding Marshall J. Root, who recently became vice president of the Fairbanks Co., New York. Since 1900, Mr. Crane has been affiliated with Pierce, Butler & Pierce Corp., Syracuse, N. Y., manufacturer of boilers, radiators, etc. He commenced as timekeeper, later became salesman and finally assistant sales manager.

Charles Riddell, formerly manager of the Chicago office of the Baldwin Locomotive Works and the Standard Steel Works Co., has returned to his duties in Chicago after an absence of 18 months on special duty at the Philadelphia office. Arthur S. Goble, who has been in charge of the Chicago office, has been made manager of the St. Louis office.

Albert E. Newton, vice president and general manager of the Reed-Prentice Co., Worcester, Mass., president of the National Machine Tool Builders association, and vice president of the National Metal Trades association, has withheld the use of his name as president of the latter organization at its next annual meeting. It is expected he will be re-elected president of the National Machine Tool Builders association, at its annual meeting.

Henry W. Benkart has been appointed Buffalo representative for the Lakewood Engineering Co., Cleveland. His offices are located in the Ellicott Square building and he will devote his efforts to the general construction field. His experience in the construction business covers a period of about 10 years, the greater portion of which time he was superintendent of construction for the Dravo Construction Co. For about five years, he has been agent for various companies manufacturing contractors' equipment, including the Lakewood company. Other lines have been discontinued and he now represents the Lakewood company exclusively.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

CONSTRUCTION of the plant of the recently organized Wyckoff Drawn Steel Co., at Ambridge, Pa., rapidly is nearing completion and in anticipation of having it in full operation in December, the company now is booking orders for delivery in the first quarter of 1920. The company, which is headed by A. W. Wyckoff, for several years engaged in the steel business and later as distributor in the Pittsburgh district of the Chalmers and Reo automobiles and who recently returned from war service in France, includes in its directorate several men prominent in business and financial circles in Pittsburgh.

The vice president of the company is G. R. Nutty, vice president of the Gulf Refining Co., Pittsburgh, while the directors include A. L. Humphrey, president of the Westinghouse Air-brake Co., Pittsburgh; William McConway Jr., vice president of the McConway & Torley Co., Pittsburgh, and R. B. Keating, vice president of the West Penn Power Co., Pittsburgh. J. J. Komara, formerly with the Columbia Steel & Shafting Co., Pittsburgh, is works manager of the company, and Joseph T. Somers, who is general manager of sales formerly was eastern district sales manager, with headquarters at Philadelphia, for the Columbia Steel & Shafting Co.

The plant of the company will have an initial capacity of 5000 tons a month of cold drawn rounds, squares, hexagons, special shapes, screw stock and alloy steel, but provision has been made for plant enlargements and increased production. All equipment for the plant has been purchased and now is in process of installation.

* * *

THE New Britain Machine Co., New Britain, Conn., is about to begin making a moderate-priced farm tractor to be known as the New Britain. Edward Glass is in charge of production.

* * *

THE South Beloit, Wis., plant of the Stewart Speedometer Corp. will be doubled in size and the force of employes will be increased more than 600 within the next six months, according to G. J. Behrendt, general manager of the Beloit shop. Production will be greatly increased after new machinery is installed.

* * *

INSTALLATION of additional pulverizing and drying machinery recently was completed by the Franklin Soapstone Corp., Henry, Va.

* * *

AN ELECTRIC furnace has just been ordered from the Electric Furnace Construction Co., Philadelphia, by the Vancouver Engineering Works, Ltd., Vancouver, B. C.

* * *

THE Continental Axle Co., Edgerton, Wis., which has been incorporated with $200,000 capital to manufacture motor truck, trailer and tractor axles, has elected the following officers: President, Andrew McIntosh; vice president, James Higgins, Racine, Wis.; secretary, E. L. Menhall; treasurer, William McIntosh; general manager, James W. Menhall. Work is progressing on the new machine shop which the company is building at Edgerton and which will be ready about Nov. 1.

* * *

THE James Mfg. Co., Fort Atkinson, Wis., maker of steel stanchions, bubbler fountains and other dairy farm specialties, is reported to be undertaking a $150,000 works improvement program which includes provision for complete malleable and gray-iron foundries as well as additions to the machine shop, sheet metal department and other shops. Plans are being prepared for a brick and steel addition, 100 x 450 feet, work on which will begin shortly after Sept. 15. W. D. James is president and general manager.

* * *

ENGAGED in the manufacture of drills for boring square and hexagonal holes as well as chucks for the drills, the Detroit Hexagon Drill Co., Detroit, has had to lease a 4-story building with basement. This gives it 50,000 square feet of floor space at the corner of Woodward and Atwater avenues and equipment now is being installed. The company's old machinery is being removed to the new address but it soon will be necessary to install new screw machines and grinders, since at present two outside concerns are making its product. The company is incorporated for $300,000, $200,000 of which is paid in. J. W. Donaldson is president and treasurer; William T. Manning, vice president; Earle R. Trombly, secretary; W. A. Smith, general manager. These with W. E. Brown, chief mechanical and electrical engineer for the Great Lakes Engineering Co., complete the board of directors. Mr. Smith also is identified with the Russell Wheel & Foundry Co., Detroit.

* * *

WITH its head office at Jackson, Tenn., the Martin Tool Holder Co., has been incorporated at $100,000. The company was organized for the purpose of manufacturing and selling a tool holder invented by T. O. Martin. To meet the large demand several machine tool manufacturers have been asked to manufacture the holder under contract. The company contemplates the building and equipping of a plant in the near future. R. L. Beare is president; I. A. Rainey, secretary and treasurer; R. F. Spragins is director and attorney; T. O. Martin is general manager.

* * *

THE Oneida Electric Truck Co., Green Bay, Wis., is being organized with a capital stock of $300,000 by local business men and officers and stockholders in the Oneida Motor Truck Co., also a $300,000 corporation which for over two years has been manufacturing gasoline commercial cars in Green Bay. The new company has taken over basic patents on an electric truck design which has been employed in a fleet of 50 cars used for the past year by the American Railway Express. For the present the electric truck will be manufactured in the present plant of the Oneida Motor Truck Co., together with gasoline cars. Officers of the new corporation are: John T. Phillips, president; F. H. Bogart, vice president; William Hoberg, treasurer; S. H. Cady, secretary. Mr. Bogart is vice president and factory manager of the old Oneida company. LaFayette Markle, president and general manager of the existing concern, is a director in the new corporation.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE foundry department of the Globe Co., Sheboygan, Wis., formerly the Globe Foundry & Machine Co., has been organized as a separate corporation known as the Globe Foundry Co., with a capital stock of $100,000, and will start work about Oct. 1 on the erection of a new gray iron foundry. When this is ready, the present Globe foundry will be converted into an addition to the machine shop now a part of the works. The Globe Co. is the outgrowth of the Honold Mfg. Co., of Sheboygan, which two and a half years ago purchased the plant and business of the Globe Foundry & Machine Co., and changed the name to the Globe Co. It has outgrown the present works and to facilitate development a new corporation has been formed, having the effect of separating the foundry and machine shops. G. F. Honold and Fred Leicht of the Globe Co. appear as incorporators of the new company with Gus A. DeWilde Jr., of Sheboygan, who becomes a stockholder and officer. Plans are being prepared for a new brick and steel casting shop to cost about $75,000. Later purchases of considerable new tool equipment will be made.

* * *

THE Wilton Tool & Mfg. Co., Boston, has purchased a half acre with factory buildings in the Roxbury district in that city, of the Boston Belting Co., which it will occupy after extensive improvements have been made.

* * *

NEGOTIATIONS have just been concluded by which the Jordan Motor Car Co., Cleveland, has purchased the property of the Metal Parts Mfg. Co., adjoining the Jordan company's factory. Edward S. Jordan, president of the automobile company, said acquisition of the metal parts property will increase the ground area occupied by the Jordan company by one-third, which will permit an increase of more than 30,000 square feet in floor space.

* * *

THE Barr Co. of Pittsburgh recently purchased the plant of the Loucks Iron & Steel Co., Roanoke, Va., including all of the equipment of the plant. The Barr Co. has begun work on dismantling the plant and selling the machinery and scrap. Equipment for a finishing mill, puddle mill, machine shop and pump house is included in the purchase.

* * *

THE Robbins & Myers Co., Springfield, O., is adding to its capital $2,500,000 to give greater scope in operations, it is announced. The company manufactures electric motors. It was organized in 1878 as a foundry. Sales last year amounted to $6,901,076, and officials state that orders this year will place this item around $9,000,000.

* * *

THE sum of $115,000 has been raised by popular subscription in Attleboro, Mass., to help finance the Mossberg Pressed Steel Co., a new corporation which will be managed by Frank Mossberg, president of the Frank Mossberg Co., makers of wrenches, etc., in that city. The new company has leased the plant of the Attleboro Steam & Electric Co. and will start operations immediately.

* * *

THE plant and equipment formerly owned by the Delta Foundry & Machine Corp. has been taken over by J. F. Shea, the plant's former manager. A new partnership between Mr. Shea and his former foreman, Mr. Dixon, has been formed to operate the plant on nonferrous casting work under the name of the Marine Castings Co., 116 Fifty-seventh street, Brooklyn, N. Y.

* * *

FREYNE, BRASSERT & CO., Peoples Gas building, Chicago, engineers, have been retained by the Lavino Furnace Co., Philadelphia, in connection with improvements being made at its Sheridan, Pa., blast furnace.

These engineers likewise have been retained by the Algoma Steel Corp., Sault Ste. Marie, Ont., as consulting and supervising engineers in the remodeling of its No. 4 blast furnace.

* * *

WITH the reorganization of the James Ohlen & Sons Saw Mfg. Co., Columbus, O., the merger of the Ohlen company and the George M. Bishop & Co., Lawrenceburg, Ind., is carried out. The name of the new company is the Ohlen-Bishop Mfg. Co. The two plants will be operated from a central office located in Columbus. E. D. Rogers is president of the merged companies; H. J. Bradbury, vice president; and L. W. Seymour, is secretary and general manager. The officers with J. J. Chester, Frank Macklin and R. V. Mitchell comprise the board of directors.

* * *

THE Fitzgerald Mfg. Co., Torrington, Conn., has just received from the General Motors Co. an order for 500,000 automobile horns. This is one of the largest orders for automobile parts ever awarded a Connecticut company. The Fitzgerald company has just completed a 2-story addition to its plant, and a large 3-story addition is planned for construction in the near future.

* * *

EXTENSIONS are contemplated by the Lima Locomotive Works, Lima, O., which will increase the plant's capacity approximately 50 per cent and which will involve an expenditure of $1,250,000. Additions will include a new erecting shop with a capacity of about 70 locomotives per month; a superheater shop extension to the boiler and tank shops; and additional power plant equipment. New machinery amounting to approximately $300,000 will be purchased. Plans have been completed but their carrying out is delayed because of the general labor condition.

* * *

THE Milwaukee Electric Crane & Mfg. Co., Milwaukee, has taken contracts for installing a 10-ton standard Milwaukee crane in the structural fabricating and erecting shop of the Lakeside Bridge & Steel Co., and a similar unit for the Worden-Allen Co., Milwaukee. A 15-ton Milwaukee foundry crane has been purchased by the Pelton Steel Co., Milwaukee. The Haskell & Barker Car Co., Michigan City, Ind., has contracted for two special wheel-handling cranes. The Jaeschke Bros. Foundry Co., Milwaukee, which is doubling the size of its gray iron foundry, will equip with one 5-ton and one 2-ton Milwaukee cranes.

Bolshevism Bankrupt — Hoover

Lenine's Theories Wrecked on Rock of Underproduction — Radicals in America Would Plunge Nation Into Insane Experiments—Only Hope for World is Work and Increased Production — General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

THE one great outstanding fact of the world today is the overwhelming unsatisfied demand for commodities. From every section of the United States and from every quarter of the globe this cry for goods and more goods is being heard. For four years the energies of 30,000,000 men in the world were diverted from peaceful pursuits to war. The ravages of war and disease combined have removed 10,000,000 able bodied men from the field of production. Consequently the world is incomprehensibly short of goods, while at the same time it is facing the task of supplying the deficiency with a working force depleted by 10 per cent as compared with prewar days.

Moreover the toilers that do remain are clamoring for shorter hours and engaging in industrial disputes and strikes, of which there have been 3000 in this country since the armistice. The reduction from a 10 to an 8-hour day, being generally insisted upon means a further curtailment of production of 20 per cent, for the argument is rarely heard now that a man can do as much in eight hours as in 10.

Despite all this, high wages are stimulating the demand for current wants, consequently the upbidding of luxuries and necessities is an important factor in soaring living costs. Obviously the watch-words of the world today should be "work" and "increased production."

Herbert Hoover, back from Europe last week, says Bolshevism is bankrupt—wrecked on the rock of underproduction. Russia has had its fling of Utopia—and it has starved. It has found that there is no magic which will turn laziness and idleness into riches or five and six hours of labor into 10 hours of production. Bolshevism won for labor fabulous wages, but labor under bolshevism failed to produce enough goods to begin to go around and the high wages meant nothing.

Lenine early saw the approaching economic collapse and he began to lure back the old experienced managers, with salaries unheard of before the war. These managers rode in state to the factories in luxurious limousines by the order of the "commissary." Now, according to Mr. Hoover, a widespread reaction has begun. The fashion of private ownership of land and factories, camouflaged somewhat at present, is coming back. Bolshevism in Russia given full rein is strangling itself.

Common Sense is Preached

Enlightened socialists honest with themselves are not blind to the folly of impeding the process of production. John Spargo says that "every serious student of the problem has realized the first great task of any socialist society must be to increase the productivity of labor," and that "it is all very well for propaganda among the masses to promise a great reduction in the hours of labor and at the same time a great improvement in the standards of living." This writer further admits that even if the capitalists were expropriated and the working class should come into possession of the organization of production "there would not be enough in the fund now going to the capitalist class to satisfy the requirements of the workers, even if not a penny were paid to the former owners."

But these things are not for the ears of the ignorant upon whose continued unenlightenment, combined with a plastic discontent, the agitator feeds. Like the unconscionable profiteers in necessities, who do not create but take advantage of a shortage of goods, the agitator is seeking to profit at the expense of a weakened, prostrate world, bewildered by the giant impact of a great war and by the strange unadjusted economic aspects of peace.

He has sought to inflame the masses by jangling incessantly the high cost of living harpstring, thereby causing appalling curtailment of production through strikes, when he knows that stimulated production is the one and only means to bring about a substantial and lasting decline in the prices of things. He is striving to stir up class consciousness among the wage earners who actually are better off than ever before, with wages higher in proportion to the cost of living than they ever received. He would fan their resentment against imagined wrongs and lull them with false promises, impossible of fulfillment. Behind these feverish attempts to advantage from the existing unsettlement there lies an insidious actuating motive in the minds of the radicals who now apparently control the American Federation of Labor.

They are not thinking of the welfare of their dupes because responsible labor leaders admit that higher wages and shorter hours at this time will merely serve to aggravate the high price sore. The real goal of the radicals is the overthrow of the existing social order. What else could be the significance of the defiance by the steel union heads of the pleas of President Wilson and Mr. Gompers an indication emphasized by the Boston police strike and the disclosure that police in 37 cities have been organized.

With the sworn protectors of lives and property under the absolute dictation of labor leaders, labor would be ready to impose the rule of the minority upon the majority. The Boston strike revealed the thin veneer which separates civilization from anarchy and has aroused the American people to the danger. The organization of police was a fatal error of the unions and the collapse of the Boston strike was a staggering blow. Without public sentiment labor cannot win a great strike and unions which would jeopardize not only the country's promised tremendous prosperity, but its institutions as well, in order, not to improve the conditions of workmen, but to compel surrender to the organizations will find themselves riding to an inevitable fall. America is not Russia and there will be no rule of the minority here.

To Absorb Other Works

At a special meeting Sept. 17 the stockholders of the Clinton-Wright Wire Co. voted to increase the capital stock from $12,500,000 to $16,000,000 and deferred action on changing the name to the General Wire Co. until an adjourned meeting Nov. 3. Some of the stockholders oppose depriving individual companies of their

identities because of their value as an asset. The resignation of Charles F. Fairbanks, Lexington, Mass., president and treasurer of the former Clinton Wire Cloth Co., as a director was accepted, he having resigned to devote all his time to the Eastern Specialty Mfg. Co., Boston. The stockholders filled the directorate to its legal number of 11 by the election of Harry W. Goddard, president and treasurer; Frank Kilmer, Grafton, Mass., secretary and assistant treasurer; and George M. Thompson, manager, all of the Spencer Wire Co., Worcester and Spencer, Mass., which was recently taken over. The company is anticipating further consolidations notably with some large steel company so that it may be supplied with raw materials.

French Form Steel Group

In order to deal in commercial, industrial and financial transactions for the purchase and sale of steel, with the exception of molding steel, an important French steel group has been formed under the name of Le Groupement des Sinistres du Nord et de L'Est. The nominal capital of the group has been fixed at 1,000,000 francs, and offices have been opened at 52 rue Taitbout, France. The group is composed of a number of firms the names of which are Societe des Acieries de Longwy; la Societe Anonyme des Usines de l'Esperance; la Societe Anonyme des Acieries de Micheville; la Compagnie des Forges et Acieries de la Marine et d'Homecourt; la Societe Metallurgique de Senelle-Maubeuge; Doremieux Fils et Cie, a Saint-Amand-Les-Eaux; la Societe Anonyme des Boulonneries de Bogny-Braux; la Societe en commandite Lefort et Cie.

Buys Tool Plant

The Fastfeed Drill & Tool Corp., 30 Church street, New York City, recently incorporated under the laws of New York, with a capital stock of $500,000, has purchased the factory at Toledo, O., operated by the McCarthy Drill & Tool Corp. J. D. McGrath, formerly treasurer of the McCarthy corporation, now is managing director of the new corporation.

The Fastfeed corporation will continue to operate the Toledo plant and will specialize in the exclusive manufacture of high-speed steel tools. Important additions to and improvements in the present equipment are planned and it is probable that an enlarged organization will be necessary to handle the contemplated increased production. For the present there will be no change in the operating staff.

Reorganize Company

Reorganization of the Hobbs Mfg. Co., Worcester, Mass., maker of paper box machinery, vending machines, nut locks and spring washers, and the increase of its capitalization from $300,000 to $700,000 has been announced. New York interests purchased the business November, 1918. The board of directors has been increased to seven.

Purchases Forge Shop

The Moore Drop Forge Co. has just completed its negotiations for the purchase of the Page-Storms Drop Forge & Wrench Mfg. Co., Chicopee, Mass., and has now assumed control of the business. This marks the practical closing out of Westinghouse interests in New England, for all of the common stock in the Moore Drop Forge Co. previously owned by the Westinghouse Co. has been purchased. The combined plants will be operated under one manager and will employ together, about 1000 men. The new officers will be: President and general manager, F. D. Fuller; treasurer, Albert H. Chapin; secretary, John M. Williams.

Profits From Shells

Shareholders of the Universal Tool Steel Co., Toronto, Ont., have received the annual report of the company for the year ending Dec. 31, last. This shows gross profits on shellmaking of $540,876, and a loss on boltmaking of $30,146. The net income for the year was $278,382. A dividend of 2 per cent on the common stock absorbed $189,824, and a dividend on the preferred shares amounted to $6000. The common stock outstanding is $9,500,000 and preferred $100,000. The company was busy on munitions practically up to the end of last year.

Financial Crop Ends

THE Vulcan Detinning Co., reports for the quarter ending June 30 net income after taxes and other charges, of $62,444 as compared with $45,999 in the corresponding period of 1918.

* * *

Amendments to its articles of incorporation have been filed by the Chain Belt Co., Milwaukee, increasing its capitalization from $1,000,000 to $2,800,000.

Export Demand

For Ammonium Sulphate Improves—By-products Market Firm

New York, Sept. 22.—An improved export demand is in evidence for sulphate of ammonia. Foreign buyers, particularly in the Orient, are inquiring on good tonnages, and a fairly good amount of trading is resulting. A drawback, however, to actual sales is the scarcity of spot material. Sizable shipments for some time past have been made by the producers, with the result that supplies now are relatively low. Domestic demand is quiet. The market on sulphate of ammonia may be quoted at $3.40 to $3.65, f.o.b. producers' plant for spot and $3.25 to $3.40 on contract orders.

Sellers of naphthalin are becoming further sold ahead. One leading seller is now unable to make shipments under Nov. 1. This sold-up condition applies particularly to flakes, although balls cannot be easily had under three or four weeks, it is understood. A feature of this market at present is a revival in the interest of the drug trade. These interests along with the dye manufacturers are bringing about considerable activity. Naphthalin, in flakes, is holding a 6½ to 7½ cents, f.o.b. producers' plants on spot and contract business, and naphthalin, in balls, 8½ to 9½ cents. These prices are unchanged from last week.

Prices of benzol are holding steady. Pure benzol is quoted at 24 to 29 cents and 90 per cent at 22 to 24 cents. Toluol also is strong, the market being around 26 to 30 cents.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Tuluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.65

Contract

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.25 to 3.40

The capital stock of the Pettigrew Foundry Co., Harvey, Ill., has been increased from $15,000 to $100,000.

Heavy Equipment Sale Increases

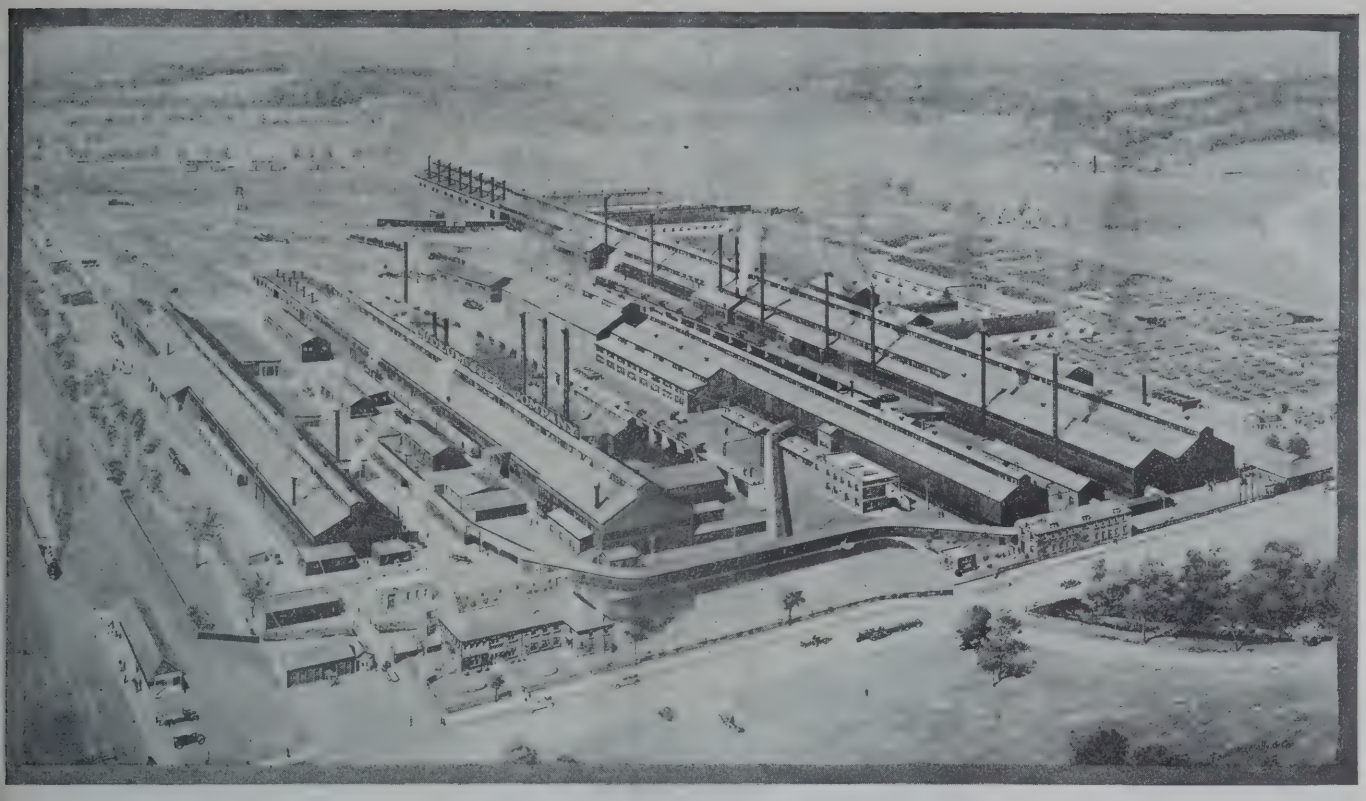
Machine Tools Slacken in East But More Freely in Cleveland—Crane Awards Are Numerous in Pittsburgh and in New York Markets—Standard Oil Closes For 28 Jib Cranes For Bayway

CONTRASTING conditions are noted in the eastern and middle western machine tool markets. In the east tool trading last week was quieter than in several months, while in the middle west, sellers have been particularly active. Inquiries are fairly heavy and sizable orders are being placed. Some eastern buyers apparently are holding up their purchases until the air is cleared of strikes and while this condition is true in a small measure in Cleveland and surrounding territory, sellers generally believe the strike will be settled before it affects their business to an appreciable extent.

Crane activity abounds in practically every market. Sellers of this type of equipment claim they have all the business they can handle. In New York, crane awards on old inquiries are particularly heavy and considerable new inquiry is current. The largest closing is by the Standard Oil Co., for Bayway, N. J. on 28 jib cranes. It also bought a 25-ton overhead for Bayonne, N. J. Crane purchasers include the Phoenix Utilities Co., of Thousand Springs, Idaho; Lehigh Valley railroad, Ashmore, Pa.; Dilts Machine Works, Fulton, N. Y.; Honolulu Iron Works, New York City and the American Smelting & Refining Co. Electric cranes were purchased by the West Penn Power Co., and the United Gas & Electric Co., New York City, while locomotive crane purchasers include L. Brenner, Lebanon, Pa.; Peace Bros., Flushing, L. I., N. Y.; J. Lipsitz Co., Chelsea, Mass.; Beacon Oil Co., Boston, and Henry W. Peabody & Co., New York City. In Pittsburgh, four, five and six cranes were bought by the Kelly-Springfield Tire Co.; Interstate Iron & Steel Co., Chicago, and the Slick-Knox Co., Wheatland, Pa., respectively. The McKinney Steel Co., Cleveland, also was a recent purchaser of electric cranes.

Inquirers for cranes include the Carnegie Steel Co., which wants four 5-ton cranes but will probably take two each 5 and 10-ton; the American Metal Co., and the Phelps, Dodge Co., New York City, the latter wanting 12 overhead cranes; the Nazareth Foundry & Machine Co., Nazareth, Pa.; Hagameyer Trading Co., and American Trading Co., New York City.

Two fair sized inquiries for tools as well as many smaller ones are out in Cleveland, one for 28 tools from A. Bentley & Sons Co., Toledo, O., and one from the Canadian Fairbanks Co., Ltd., Montreal, Que., 15 tools, including some heavy equipment such as bulldozers, steam hammers, etc. The Baldwin Locomotive Works, Philadelphia, is supposed to have wound up its purchases for the present. Many automobile companies figure among the buyers in the middle west.



Prices have become stabilized and are near the wartime level. Deliveries on heavy machines are deferred about eight weeks; spot delivery being offered only on some types of lighter equipment.

Crane Awards Feature Eastern Equipment Mark

FEATURING the eastern equipment market is considerable activity in cranes. Numerous awards are being made, and several sizable new inquiries are out. The largest single award this week involved 28 jib cranes for the Bayway, N. J., plant of the Standard Oil Co. of New Jersey. Other orders include a 40-ton overhead crane for the Phoenix Utilities Co., for Thousand Springs, Idaho. This business was placed through the Electric Bond & Share Co., New York City, with the Toledo Bridge & Crane Co. The Whiting Foundry & Equipment Co. has been in receipt of considerable business. Orders booked by this company within the past few days include a 10-ton electric crane for the Lehigh Valley railroad, Ashmore, Pa.; a 5-ton electric crane for the Dilts Machine Works, Fulton, N. Y.; a 10-ton crane for the Honolulu Iron Works, with offices in New York City; a 10-ton electric crane for the American Smelting & Refining Co., for shipment to Mexico, and a 25-ton overhead crane for the Bayonne, N. J., plant of the Standard Oil Co.

New inquiries in the electric crane market include three cranes for the American Metal Co., New York City. One crane is to be of five tons capacity, and the remaining two of 10 tons capacity each. The Phelps-Dodge Corp., 99 John street, New York City, is in the market for 12 overhead cranes, ranging in capacity from five to 60 tons. The Nazareth Foundry & Machine Co., Nazareth, Pa., is inquiring for a 15-ton overhead crane. The Hagermeyer Trading Co., 17 Battery Place, New York City, is asking bids on a 7-ton traveling crane for export. The American Trading Co., 25 Broadstreet, New York City, is in the market for a small special crane for shipment to France.

Several sizable orders have been placed in the locomotive crane market. L. Brenner, scrap merchant, Lebanon, Pa., has bought a 15-ton Browning Crane. The American Car & Foundry Co., 165 Broadway, New York City, has purchased a 25-ton crane from the Orton & Steinbrenner Co. This latter company also has been awarded a 15-ton locomotive crane by J. Lipsitz, Chelsea, Mass. The Orton company also has been awarded a 15-ton crane by the Beacon Oil Co., Boston, Mass., and a 15-ton crane by Henry W. Peabody & Co., 17 Battery Place, New York City, for export. The Hugh Nawn Contracting Co., Fifth

and good reasons have we for being so.

Our plant, the culmination of over sixty-five years of specialized steel making, is one of the most complete in the world.

From ingot to finished product, it guards the quality of Ludlum Steel thruout every operation of its manufacture, by a system of analysis and inspection that is unequaled anywhere.

Its thousands of loyal employes labor daily to uphold the high reputation of Ludlum Steel.

Its mammoth steam hammers, its rolling mills, heat-treating furnaces, chemical and metallurgical laboratories, machine shops—every department of its entire organization is working tooth and nail to produce *quality*.

Write for our Ludlum Steel Catalog which describes in detail the manufacture and treatment of our steels.

LUDLUM STEEL COMPANY, General Offices and Works: WATERVLIET, N. Y.

Branch Offices: Chicago, Cincinnati, Cambridge, Mass., Cleveland, Detroit, Philadelphia, Buffalo, Pittsburgh, New York City

avenue and Forty-third street, New York City, is figuring on some conveying equipment. This company is contractor in charge with the construction of the $5,000,000 Gilboa dam in New York state. Peace Bros., Flushing, L. I., have bought a 15-ton used locomotive crane.

Additional awards in the electric crane market include a 5-ton bucket handling crane for the West Penn Power Co. This order was placed by Sanderson & Porter, 52 Williams street, New York City, with the Milwaukee Electric Crane & Mfg. Co. A similar crane was recently ordered from the Milwaukee company by the United Gas & Electric Co., 61 Broadway, New York City.

The past week in the machine tool market has been one of the most quiet periods in some time. Inquiries were small and scattered, and orders were relatively few. Pending settlement of the steel labor question and an improvement in foreign exchange rates, this situation is likely to continue, according to leading interests in the trade. The Baldwin Locomotive Works, Philadelphia, possibly the largest buyer of late, has completed its purchases, covering on approximately $100,000 worth of equipment.

While not so buoyant as they were last month, prices nevertheless, remain strong. The situation with regard to deliveries also is showing little change. Some of the heavier machines, such as large boring mills and planers, are holding around six to seven months; the lighter equipment, for the most part, is available for almost spot delivery.

On Oct. 2, bids will be opened at Washington on a quantity of miscellaneous machinery. This includes three chaser grinders; two power grindstone frames; 10 drill grinders; one heavy guide bar grinder; two nut-facing machines; 17 16-inch shapers; three cutting off machines; three hack saws; two millers; 11 drilling machines; one belt-lacing machine; five engine lathes; three pattern-makers' lathes; three turret lathes; one balancing machine; one steam hammer.

Crane Awards Heavy in Pittsburgh

SEVERAL crane inquiries which have been out in the Pittsburgh district for several weeks past recently, have been closed. The Pittsburgh Crucible Steel Co. has bought a 15-ton Morgan bucket crane while the four cranes inquired for in connection with the new plant of the Kelly-Springfield Tire Co. also have been placed, three small cranes going to the Shaw Electric Crane Co., Muskegon, Mich., and a large one to the Morgan Engineering Co., Alliance, O. The interstate Iron & Steel Co., Chicago, has ordered five Morgan cranes and the Slick-Knox Co. also has contracted for six Morgan cranes, four 15-ton and two wall cranes. The Erie Foundry Co., Erie, Pa., has closed for a 50-ton Champion crane with a 10-ton auxiliary. The Milwaukee Electric Crane Co. has taken a 4-motor, 34-foot span bucket crane from the West Penn Power Co.

The Carnegie Steel Co. has put out an inquiry for four 5-ton cranes with an alternative proposition for two 10-ton and two 5-ton cranes. Inquiry for a line of mill equipment is reported from a large French steel manufacturer making a substantial addition to his plant. Steady demand still is noted for machine tools and builders of a number of lines now are not promising deliveries short of eight weeks.

Cleveland Sellers Undisturbed by Strike

WHILE it is rather early for the sale of machine tools in Cleveland to be affected by the general iron and steel strike, dealers believe the trouble will be settled before this occurs. Business is in an extremely healthy condition; in fact sellers are at a loss to explain the reason for the sudden influx of inquiries and orders in view of the present unsettled labor situation. It is conceded, however, that considerably more business would be transacted if the labor trouble would subside. This recent activity is particularly true of heavy equipment, including cranes. Automobile plants, tractor manufacturers, oil well equipment builders, etc., are taking heavy planers, boring mills, etc. Sellers of cranes have all the business they can handle and inquiries are coming from all parts of the country. The McKinney Steel Co., Cleveland, recently purchased 20 and 40-ton electric cranes.

Two large machine tool inquiries are current in the Cleveland market, one from A. Bentley & Sons Co., Toledo, O., and the other from the Canadian Fairbanks Co., Ltd., Montreal. The former calls for 28 miscellaneous machines, including eight engine lathes, two each

American Exports of Machinery to Java Increase

AMERICAN trade in machine tools with the Netherland East Indies, beginning in 1902 with a valuation of but $20,000, increased in 1917 to more than $2,000,000, giving it leadership over all other countries.

The Netherland East Indies was a neutral territory during the war and the German name still carries a certain good will in engineering circles. The German firms in Java have not only kept their doors open and their organizations complete throughout the war, but they have been able to show a profit on the business done. British manufacturers are also well organized.

United States consular reports say:

The position now held by American manufacturers can be maintained if those interested will make a reasonable effort. As yet America has done very little work in the Java market, but Germany's record, in the accompanying table, shows what can be accomplished by good and persistent salesmanship. Active effort, with American methods, will show even better results, especially if started at once. American banks have opened branches in Java; American steamers now run direct and regularly. Conditions are right, and it seems probable that trade energy can be expended more profitably in the Netherlands East Indies than in many of the other markets of the world.

The table below gives the value of the total machinery imports and the share of this trade held by three principal exporting countries from 1900 to 1917, inclusive. Although these figures include the machinery imported into the whole archipelago, by far the greater part of this equipment went to Java:

Year	Great Britain	Germany	United States
1900.....	$ 901,686	$ 70,350	$ 20,100
1901.....	597,774	77,184	75,174
1902.....	309,138	147,534	29,346
1903.....	332,454	131,856	19,296
1904.....	387,528	147,131	38,592
1905.....	614,658	197,784	49,848
1906.....	509,334	438,582	45,828
1907.....	707,922	561,996	50,250
1908.....	1,033,542	526,620	46,632
1909.....	648,828	476,772	36,984
1910.....	817,668	736,062	85,224
1911.....	1,290,822	1,053,642	106,128
1912.....	2,191,704	1,511,520	122,610
1913.....	1,835,532	2,208,990	204,618
1914.....	1,973,418	1,349,916	295,068
1915.....	1,159,368	223,914	379,890
1916.....	1,568,604	26,934	1,165,800
1917.....	1,518,756	7,236	2,474,312

Handle It with a Crane

FOR handling heavy materials; for storing coal; for storing and rehandling anything, or switching cars, the Link-Belt Locomotive Crane is a useful and profitable machine around the yard. When not in use for the specific purposes for which it is purchased you will find there is always some other profitable work for such a machine to do. Write for Locomotive Crane Catalog No. 370.

And remember this, a Link-Belt Crane will be on the job every day—no layoffs, strikes, or demands for higher wages. Our Crane is "Built for Service", and you can always depend upon it.

LOCOMOTIVE CRANES

turret lathes, radial drills, goose neck drills, sensitive drills, planers, shapers, horizontal boring mills; three vertical boring mills, a milling machine, etc. The inquiry from the Canadian Fairbanks Co. is for shipment to Vancouver and specifies, one double end punch and shear, shear to have 36-inch throat, punch to have 36-inch throat to punch 1¼-inch holes in 1-inch plate; one angle iron bending machine for bending 4 x 4-inch angles; one bull dozer to bend I-beams up to 15 inches; one 1500-pound steam hammer; one gear cutting machine capable of cutting 36-inch spur gears, 2-inch circular pitch, also to cut bevel gears up to 36 inches in diameter; one horizontal boring mill, capable of boring to the center of a 102-inch circle; one gear cutting machine, suitable for cutting 36-inch spur gears, 2-inch circular pitch, also for cutting 36-inch bevel gears, 2-inch circular pitch; one 42-inch open side planer, 12-foot bed; one angle iron bender for 4 x 4-inch angles or channel irons; one double end punch and shear, to shear 1-inch plate, shear to have 36-inch throat, punch to have 36-inch throat capable of punching 1½ or 1¼-inch hole in 1-inch plate; one 1500-pound crosshead type steam hammer; one 36-inch triple geared lathe, 14 feet between centers; one 4 or 5-foot radial drill, either full universal or with universal box type table; one 3-inch bolt threader; one bull dozer, suitable for bending and straightening I-beams up to 15 inches.

A heavy demand is noted from automobile manufacturers. Among the equipment wanted by the Holmes Automobile Co., Canton, O., is some tapping machines. The F. B. Stearns Co., Cleveland, desires to obtain some automatic screw machines. The Templar Motors Corp., Cleveland, and the Peerless Motor Car Co., that city, also are understood to be in the market for some equipment. The Dort Motor Car Co., Flint, Mich., is preparing for expansion and has issued some tentative inquiries for equipment. The Hudson Motor Car Co., Detroit, and other Michigan automobile companies are in the market. The Columbia Axle Co., Cleveland, is still in the market for Warner & Swasey screw machines, tapping machines, drills, etc.

Other smaller inquiries are received from various industries. The Broadfoot Iron Works Co., Wilmington, N. C., wants a lathe, a milling machine, a key-seating machine and some other equipment. The Apex Electrical Mfg. Co., Cleveland, wants two grinders, a bandsaw, etc. The Ohio Blower Co., Cleveland, wants a 48-inch power square shear. Wilcox, Lynn & Co., Ravenna, O., machinists, want a 20 to 24-inch lathe. The United States Tire Co. and the Cleveland Osborne Mfg. Co., Inc., both of Cleveland, are in the market for some miscellaneous equipment. The Electric Vacuum Cleaner Co., also of Cleveland, has purchased a semi-automatic Frazer grinder, increasing the hourly production on a small grinding job from 40 to 1500. The Kilby Mfg. Co., Cleveland, wants a 12-foot boring mill, taking 7 feet or more under crossrail. The Aetna Brass Mfg. Co. Cleveland, still is advertising for used polishing lathes, and the Manitowoc Shipbuilding Co., Manitowoc, Wis., is asking for a heavy gate shear or Bliss type, doubled geared, double crank, press ram pressure capacity 600,000 pounds, 84 inches between housings.

Prices remain firm at recent advances. In some cases they now are within 12½ per cent of the highest prices asked during the war.

Chicago Buyers Take Light Equipment

MOST buying of machine tool equipment in the Chicago market at present is of light machinery rather than heavier types. In the experience of some dealers there is a special demand for millers and it is now difficult to place orders for reasonable delivery for the No. 2 size. This demand indicates renewed activity in small machine shops, as millers usually are bought after lathes and other primary equipment has been installed and business enlarges. This also fits into the situation which has continued over several months, buying of single tools rather than complete equipment.

Considerable demand is noted for tools to be used by manufacturers of heavier types of tractors and by refrigerating machinery manufacturers especially.

Deliveries are becoming more delayed, and 60 to 90 days is about the average. All prices which had been reduced since the first of the year have gone back to their former level and any tendency toward a change seems to be upward rather than downward. The Moline Plow Co. has not yet made inquiry for equipment for its general machine shop recently burned, and, as indicated last week, it is understood this machinery will be bought from government stocks. Montgomery, Ward & Co., who are building an engine manufacturing plant at Springfield, Ill., complete from foundry to paint shop, continues to place orders for the necessary equipment.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

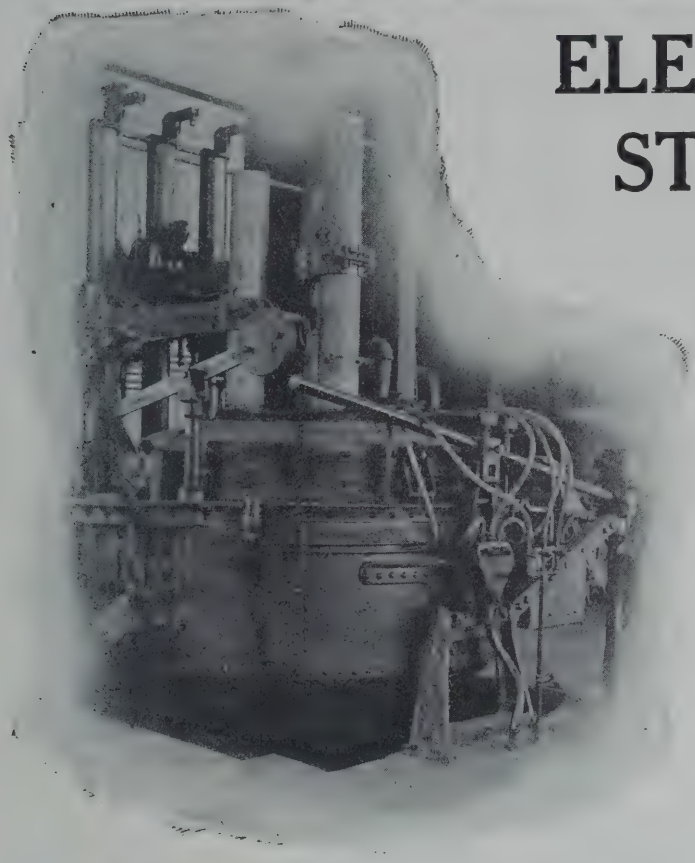
PORTLAND, ME.—The Arkin Fastener Co. has been incorporated with $60,000 capital by William Shepherd Linnell, B. L. Merryman and William M. Bradley.

PORTLAND, ME.—The Theatric Welding Co. of America, Inc., has been incorporated with $75,000 capital by James M. Graham, Charles M. Parker and Lewis G. Parker.

PORTLAND, ME.—The East Coast Fisheries Products Co. has been incorporated to build vessels and boats with $50,000,000 capital by Frank I. Cowan, H. W. Baston and Clement F. Robinson.

BOSTON.—The S. A. Woods Machine Co. plans a plant, 2-stories, 70 x 250 feet, to cost about $90,000.

BOSTON.—The S. M. S. Co. has been incorporated to manufacture machinery, motor vehicles, tires, etc., with $45,000 capital by Thomas J. Sullivan, Arthur M. Marston and Lewis W. Skillings.



BOSTON.—The R. L. Harper Co. has been incorporated to manufacture engines, motors, machines, etc., with $50,000 capital by Robert Lee Harper, Robert C. McGowan, and Henry D. Nunn.

CAMBRIDGE, MASS.—The Cambridge Machine & Tool Co. has been incorporated with $35,000 capital by Antonio Marciano, Vinent Popoli and Huran H. Seron.

EVERETT, MASS.—The Beacon Oil Co. will build

FARRELL-CHEEK

ELECTRIC FURNACE STEEL CASTINGS

Every electric furnace steel casting made in our foundry is carefully nursed from the day it enters as an order until it is ready for the final, critical examination. The same master workmen, who made the enviable reputation of the Farrell-Cheek Foundry, are now turning out superior electric furnace steel castings.

MEMBER OF STEEL FOUNDERS' SOCIETY OF AMERICA QUALITY SERVICE PRICE LEADERS OF THE WORLD ASSOCIATED NEW YORK, U.S.A.

And so it is easy to understand why Farrell-Cheek electric furnace steel castings make good. They ***are*** better. The metal is right to start with, and every operation in the making is scrutinously watched to ensure the maintaining of the high standard which characterizes all Farrell-Cheek Castings.

Your work is completed and delivered quickly. Give this exceptional service your consideration, too.

Say you saw it in THE IRON TRADE REVIEW

a 1-story, 36 x 90-foot machine shop, 53 x 108-foot boiler house and a 39 x 95-foot storehouse to cost $70,000.

FALL RIVER, MASS.—The New England Oil & Refining Co. has let the contract for a $500,000 plant to include seven steel tanks.

LOWELL, MASS.—Knowlton & Newton Co., Inc., has been incorporated to do a general sheet metal business with $20,000 capital by Harry W. Knowlton, Joseph N. Leonard, Lexington, Mass., and Wilmer A. Newton.

LYNN, MASS.—The Hancock Perfecting Lineup Machine Co. has let the contract for a 1-story, 48 x 128-foot factory.

NORTHAMPTON, MASS.—C. A. Maynard, Green street, manufacturer of garden tools, plans to rebuild his forging shop which was recently damaged by fire.

NORWOOD, MASS.—A Hershenson & Co., Inc., has been incorporated to deal in iron, metals, etc., with $3000 capital by Alek Hershenson, M. Hershenson and Jacob Miller.

SPRINGFIELD, MASS.—The Duckworth Chain & Mfg. Co. contemplates a plant, 1-story, 50 x 120 feet.

SPRINGFIELD, MASS.—The Forging Service Co. has been incorporated with $25,000 capital, by J. Howard Jones, N. C. French and Walter H. McCarthy.

SPRINGFIELD, MASS.—Bids have closed for a 4-story and basement, 50 x 101-foot addition to the factory of the Bemis & Call Hardware & Tool Co., maker of wrenches, to cost $45,000.

WATERTOWN, MASS.—Bids closed Sept. 22 for a machine shop, 42 x 362 feet, at the United States arsenal.

WALTHAM, MASS.—W. H. Nichols has let the contract for a 80 x 150-foot machine shop to cost $25,000.

WOLLASTON, MASS.—Bids closed Sept. 24 for the erection of a plant for the Tubular Rivet & Stud Co.

WORCESTER, MASS.—The Worcester Pressed Aluminum Co. has been incorporated with $150,000 capital by Cornelius A. Brosnan, Edwin W. Whitmore and A. E. McGrath.

PROVIDENCE, R. I.—The American Boiler Tube Thimble Co., 95 Orms street, has been organized to manufacture metal products, by John F. McKenna and others.

BRIDGEPORT, CONN.—The American Tube & Stamping Co. has plans for alterations and extensions to its plant.

BRIDGEPORT, CONN.—The Perfection Shear Co. has been incorporated with $5000 capital by E. F. Von Wettberg, G. P. Brett Jr. and A. Dunn.

DANBURY, CONN.—A $55,000 machine shop, 1-story, 90 x 200 feet, will be erected here by Doram Bros., hatters' machinery.

ELMWOOD, CONN.—The Whitlock Coil Pipe Co. has awarded a contract for a 1-story machine shop, 48 x 71 feet.

NEW BRITAIN, CONN.—The Trumbull Electric Co. contemplates a plant addition, 4-stories, 50 x 106 feet.

NEW HAVEN, CONN.—The American Radiator Co. has awarded a contract for a 2-story building, 100 x 135 feet, to cost about $85,000.

WATERBURY, CONN.—Plans have been completed for a $60,000 plant, 50 x 120 feet, for the Manufacturers Foundry Co.

WINSTED, CONN.—Plans are being prepared by the Fitzgerald Mfg. Co. for a plant to manufacture automobile accessories.

North Atlantic States

BROOKLYN, N. Y.—Barber & Co., 17 Battery place, is having plans drawn for a machine shop, 1-story, 100 x 100 feet, to cost $50,000.

BROOKLYN, N. Y.—The Columbia Tinware Co. has been incorporated with $20,000 capital, by J. Levitt, J. Menoff and S. Antoville, 351 East Forty-ninth street.

BROOKLYN, N. Y.—Laverne C. Brown, Inc., boats and cras, recently was incorporated with $50,000 capital, by J. P. Moran, L. C. and A. L. Brown, Hotel Commodore.

BROOKLYN, N. Y.—The Kenmore Sheet Metal Works, Inc., has been incorporated with $5000 capital, by M. and R. and M. L. Krissberg, 1079 Coney Island avenue.

BUFFALO.—The Federal Metal Hose Corp. has been incorporated with $78,750 active capital, by C. C. Baysar, I. W. Smith and C. Palmer.

BUFFALO.—The Buffalo Nipple & Machine Co. is arranging to build a factory in this city to cost $10,000.

BUFFALO.—The National Plyer Co., Inc., hardware specialties, has been incorporated with $25,000 capital, by K. B. MacDonald, 34 Penhurst Park, W. R. Daniels, 903 D. S. Morgan building, and others.

ELMIRA, N. Y.—This city is considering a bond issue of $5,000,000 for an extension to its waterworks plant.

JAMESTOWN, N. Y.—The Mobilex Accessory Co., auto accessories, has been incorporated with $25,000 capital, by A. Wedeborg, A. E. Tunberg and W. E. Tiffany.

JAMESTOWN, N. Y.—The Chautauqua Electric Power Co., capital $750,000, will remodel the plant of the Supreme Furniture Co. at Falconer, N. Y., to make electric cars. Address E. J. McGee, of this city.

LOCKPORT, N. Y.—The Lockport Auto Radiator Corp. has been incorporated with $30,000 capital, by J. L. Branch, C. D. Nye and F. M. Capell.

NEW BALTIMORE, N. Y.—The New Baltimore Shipbuilding & Repair Corp. has been incorporated with $45,000 capital by W. W. Stebbins, W. J. Wade and R. B. Drew, 597 Henry street, Brooklyn, N. Y.

NEW YORK.—The National Auto Accessories Co. has been incorporated with $25,000 capital, by H. and M. and L. Epstein, 127 West 112th street.

NEW YORK.—The Feridus Machinery Co. has been incorporated with $10,000 capital by S. E. and B. Aaron and B. Salinsky, 31 Essex street.

NEW YORK.—Charles Cory & Son, 290 Hudson street, nautical instruments, has plans for a 6-story plant, 76 x 150 feet, to cost $185,000.

NEW YORK.—The Adeco Industrial Co., engines, etc., has been organized by Albert West and Frederick Cardway, New Rochelle, N. Y.

NEW YORK.—The Wilson-Maeulen Co., 781 East 142nd street, pyrometers, etc., is having plans prepared for a 3-story addition, 50 x 100 feet.

NEW YORK.—The New York Wire Cloth Co., 233 Broadway, is taking bids for a 2-story addition, 45 x 80 feet, to cost about $30,000.

NEW YORK.—The Monofer Shipbuilding Co. has been incorporated with $30,000 active capital, by L. F. Sniffin, J. L. Druck and F. Kweton, 49 Wall street.

NEW YORK.—The Acme Furnace Equipment Co. has been incorporated with $21,000 capital, by E. W. Sturart, R. W. Owens and F. M. Clute, 100 Broadway.

NEW YORK.—The Raymond Mfg. Co., machine shop and foundry supplies, has been incorporated with $150,000 capital, by H. O. Zurich, 5 Wilson court, Ocean Parkway, M. Sonken, 178 DeKalb avenue, Brooklyn, N. Y., and M. Cohen, 1226 Boston road.

NEW YORK.—The Supreme Metal Products & Refining Works, Inc., welders, toolmakers, etc., has been incorporated with $30,000 capital, by M. Berinkow, 94 Wilson street, Brooklyn, N. Y., B. Bernstein, and R. Bernstein, 522 West 136th street, New York.

NIAGARA FALLS, N. Y.—The Carborundum Co., Buffalo avenue, has had plans prepared for a 3-story addition, 99 x 224 feet, to cost $150,000.

NORTH PELHAM, N. Y.—The American Tekstag Products Co., boiler metal preserving materials, has been incorporated with $35,000 capital, by J. Meyer, C. Adams and L. M. Moehler, 1 Madison avenue.

ROCHESTER, N. Y.—The Francis Metal Door & Window Corp. has been incorporated with $25,000 capital, by A. W. and I. M. and G. D. Francis.

ROCHESTER, N. Y.—The North East Electric Co. 348 Whitney street, has let the contract for an addition, 76 x 140 feet, to cost $60,000.

UTICA, N. Y.—The Utica Heater Co. has awarded contracts for three additions, to cost about $20,000.

BEAVER FALLS, PA.—The Keystone Driller Co. is having plans prepared for a 2-story plant 40 x 60 feet.

BOYERSTOWN, PA.—The Boyerstown Brass Foundry Co. has been incorporated with $50,000 capital, by W. M. Johnson, A. R. May and Garrett J. Henves.

CARBONDALE, PA.—The Carbondale Machine Co. has awarded a contract for a machine shop, 1-story, 20 x 220 feet, to cost about $60,000.

CONNELLSVILLE, PA.—The Sligo Iron & Steel Co. will build a warehouse 60 x 270 feet.

CORAOPOLIS, PA.—The Standard Steel Spring Co. is having plans prepared for two 1-story buildings.

ELLWOOD CITY, PA.—This city is considering the erection of a municipal garbage disposal plant.

ERIE, PA.—The Westcott Valve Co. has plans for a plant at Seneca Falls, N. Y., to cost $25,000.

ERIE, PA.—The board of water commissioners will build a 15,000,000-gallon reservoir.

ERIE, PA.—The Rickart-Shafer Co., machine tools, plans a new plant, 50 x 152 feet.

FLEETWOOD, PA.—The Cambria Car & Foundry Co. has been incorporated with $50,000 capital, by William J. Thiele, Herman J. Widmar and J. M. Gastmann.

LANCASTER, PA.—The E. T. Fraim Lock Co. is having plans drawn for a machine shop, 1-story, 44 x 82 feet.

MONACA, PA.—This city is considering plans by Elmer E. Sproul for a waterworks plant.

PHILADELPHIA.—Contracts for a machine shop addition, to cost $13,000, have been awarded by the Robert E. Lamb Co.

PHILADELPHIA.—Property has been purchased by the Wicaco Screw & Machine Works, Inc., for a $100,000 plant.

PHILADELPHIA.—Contract for a $35,000 machine shop and laboratory for the Sharpies Specialty Co. has been awarded. The building will be 1-story, 75 x 104 feet.

PHILADELPHIA.—The Atwater Kent Mfg. Co., mechanical and electrical equipment, has been incorporated with $5000 capital, by Atwater Kent, Ardmore, Pa., W. J. Little and Paxson Deiter.

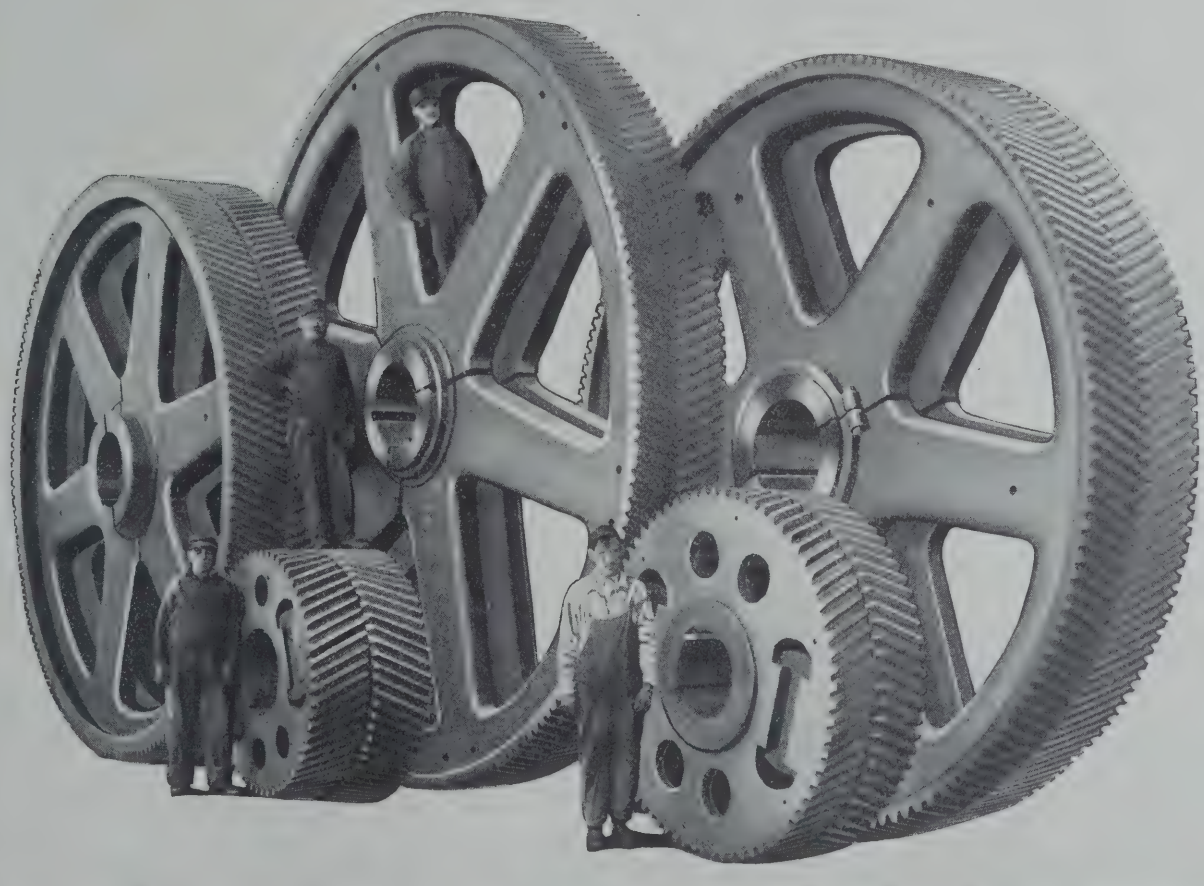
PHILADELPHIA.—The Philadelphia Metal Lathing & Furring Co. has been incorporated to manufacture metal lathing with $5000 capital, by M. H. Jester, 102 North Dewet street, John J. Bauer, 2139 North Twelfth street, and others.

PITTSBURGH.—The Pittsburgh Valve Foundry & Construction Co., Twenty-sixth street and the Alle-

FOR ECONOMY OF SPACE AND POWER

—are you wasting either?

When you figure on big reductions with a train of spur gears be sure to take into consideration the wastage of space and power. Herringbone Gears make direct reductions as high as 20 to 1, thereby saving space and power losses.



This type of gear has many other advantages: The action is continuous and smooth; there is no shock of transference from tooth to tooth; the teeth do not wear out of shape; the bending action of the load on the teeth is less than with straight gearing; "back-lash" is entirely absent; friction and mechanical losses are reduced to a minimum; herringbone gears can be used at greater velocities than any other kind.

Herringbone Gears are hobbed from the solid by means of special machinery to get precision heretofore not attained in gear cutting. They are far more efficient than belts, ropes, worm gears or compound trains of spur gears. They are particularly quiet in action and cause practically no vibration—two big advantages which are lacking in spur gears.

Our descriptive booklet contains much valuable information concerning gears and gearing problems. Send for it today.

The Falk Company, Milwaukee, Wis.

AGENTS: Pittsburgh—W. O. Beyer, 1024 Park Bldg. New York—M. P. Fillingham, 50 Church St. Wilkes-Barre—Vulcan Iron Works. Denver—Denver Engineering Works. San Francisco—F. W. Grimwood, Rialto Bldg.

FALK HERRINGBONE GEARS

gheny Valley railroad, has completed plans for a 1-story plant addition.

PITTSBURGH.—The Oliver & Snyder Steel Co. contemplates a boiler house, 1-story, 44 x 64 feet.

PITTSBURGH.—The Union Steel Casting Co. will build a plant shortly at 6100 Butler street to cost $27,000.

SHARON, PA.—Frank Taylor & Son, of this place, have the plans for the iron works for A. N. and Louis Rosenblum.

WILKES-BARRE, PA.—The Guarantee Silk Corp. is taking bids for a power plant here.

WILKES-BARRE, PA.—The Wilkes-Barre Iron & Wire Works Co. has been incorporated with $10,000 capital, by Hugh P. Watters, Scranton, Pa., and others.

RAHWAY, N. J.—The Superior Body Co. has been incorporated with $500,000 capital, by Joseph Axman, Thomas Armstrong and David Armstrong.

JERSEY CITY, N. J.—The Marion Mfg., iron and steel, has been incorporated with $100,000 capital. The company has an office at 665 Newark avenue.

NEWARK, N. J.—The Prest-O-Lite Co. has let a contract for two factory buildings.

NEWARK, N. J.—Plans are being prepared by the Irving Mfg. Co. for an extension, 3-stories, 50 x 50 feet.

NEWARK, N. J.—The Atlantic Smelting & Refining Co. has let a contract for a factory building to cost $100,000.

NEWARK, N. J.—The Newark Auto Body & Repair Co., Newark street, has been incorporated by Thomas J. Gorman and others.

NEWARK, N. J.—The American Transformer Co. has awarded a contract for a plant addition, 1-story, 11 x 67 feet.

NEWARK, N. J.—The American Platinum Co., Oliver street and New Jersey Railroad avenue, will erect a 3-story, 50 x 132-foot plant and a boiler hoose, 1-story, 25 x 42 feet.

NEWARK, N. J.—Work has been started on a $110,000 garage and sales building for the Franklin Motor Car Co. The building will be 3-stories and one of the floors will be devoted to repair and assembly work.

NEWARK, N. J.—The Witteman-Lewis Aircraft Co. has begun work on a plant. Three buildings are under construction. The main building, one of two stories is 165 x 200 feet, will be used for a construction and assembling room. Another building is be devoted to engine testing, and will also contain the boiler and engine equipment.

BALTIMORE.—The Baltimore Spring Works, 118 Dauphin street, will build a 3-story addition.

BALTIMORE.—The Baltimore Water & Electric Co. has let the contract for a pump house to cost $15,000.

BALTIMORE.—Hill & Ferguson, 112 East 19th street, New York, will prepare plans for a waterworks plant in this city.

BALTIMORE.—The Federal Mfg. Co., aluminum solder, has been incorporated by James T. Carter, 900 Maryland Trust building, and others.

BALTIMORE.—The Baltimore Tube Co. has awarded a contract for a milling shop, 1-story, 75 x 144 feet, to cost about $25,000.

BALTIMORE.—The Boyden Co-Ordinating Car Corp., Keyser building, has been organized by George Boyden and others. The company is reported planning to build plants in various parts of the country for the manufacture of car trucks.

NORFOLK, VA.—The Western Electric Co. is planning to erect a branch plant here.

NORFOLK, VA.—The Norfolk Metal Plating & Galvanizing Co. has been incorporated with $10,000 capital, by R. E. Pelot, A. G. Ellis and others.

RICHMOND, VA.—The American Can Co. is reported planning to improve its plant here at an estimated cost of $10,000.

Central States Activity

CHIPPEWA FALLS, WIS.—G. W. Johnson, former superintendent of the Chippewa Foundry & Machine Co., is organizing a new corporation for the manufacture of a pumping engine. A machine shop is now being erected.

FOND DU LAC, WIS.—The Vulcan Mfg. Co. is having plans prepared for a 1-story shop addition, 40 x 150 feet, to cost $20,000 and will buy new equipment costing $15,000.

HARTFORD, WIS.—The Ideal Mfg. Co., medical instruments, has purchased the Hahn building, and will move its plant after remodeling work is completed.

JANESVILLE, WIS.—Bids are being taken by the board of education, S. C. Burnham, secretary, for the erection of a new high school estimated to cost $250,000. A boiler house is included in the plans.

KENOSHA, WIS.—The Chicago & Northwestern railroad has approved plans for a $300,000 bridge.

KENOSHA, WIS.—The Winther Motor Truck Co. is planning plant additions and the purchase of some new equipment.

KEWASKUM, WIS.—The Kewaskum Aluminum Mfg. Co. has been organized with $150,000 capital and will erect a 3-story, plant at an estimated cost of $50,000.

MILWAUKEE.—The Western Machine Co., which recently increased its capital, will enlarge its facilities.

MILWAUKEE.—The Harley-Davidson Motor Co. will enlarge its main plant by a 5-story addition, 120 x 215 feet, to cost with machinery $350,000.

MILWAUKEE.—The Milwaukee Tank Works, 851 Kinnickinnic avenue, has let contracts for a 1-story warehouse, 80 x 100 feet.

MILWAUKEE.—Bliss Bros. Tool Co., 62 Mason street, has increased its capital stock from $15,000 to $40,000. The output of tools, dies, jigs and fixtures is being increased.

MILWAUKEE.—The Perfection Bottle Cap Co. has been organized with $100,000 capital, by Carl J. Shuster, August C. Barthmann and Louis E. Will, to manufacture metal caps for bottles, etc.

MILWAUKEE.—Articles of incorporation have been filed by the Machine Products Co., with $10,000 capital. The incorporators are Jay J. Van Vechten, Robert A. Radwick and Oliver W. Bow.

MILWAUKEE.—The Nash Motors Co., Kenosha, Wis., plans the first unit of its new plant. The building will be 200 x 600 feet. It is expected contracts will be let shortly for the power and boiler house.

MILWAUKEE.—The James Mfg. Co., Ft. Atkinson, Wis., will ask for bids shortly for an addition, 400 x 600 feet. Complete foundry equipment, including cranes, conveyors, etc., will be purchased. J. G. Shodron is superintendent.

MILWAUKEE.—The American Electric Motor Co., capitalized at $175,000, has been chartered to manufacture electric motors and other devices by Walter N. Sprinkmann, Harry B. Mortimer and Carl M. Daum.

MILWAUKEE.—The Koehring Machine Co., manufacturer of concrete mixers, will build an erecting shop and office building three stories, 73 x 327 feet, and an addition to its machine shop, 60 x 118 feet, costing $107,000.

MILWAUKEE.—The Lewis Steel Products Co., Toledo, O., has engaged Architect Alfred C. Clas, Colby & Abbot building, to prepare plans for a foundry and machine shop addition, 150 x 360 feet, estimated to cost about $350,000.

MILWAUKEE.—The American Electric Motors Co. of Milwaukee, has been incorporated with a capital stock of $175,000 by Walter N. Sprinkmann, Harry B. Mortimer and Carl L. Daum to manufacture electric motors, motor-driven appliances and devices, etc.

MILWAUKEE.—A training building for apprentices will be erected in connection with the Milwaukee harvester works of the International Harvester Co. at an estimated cost of $35,000. The building will be 120 x 125 feet, one story high.

OSHKOSH, WIS.—The Oshkosh Motor Truck Co. has acquired a tract for its proposed machine shop and assembling floor, to be 150 x 300 feet.

OSHKOSH, WIS.—The Bull Dog Tractor Co., A. H. Gruenwald, manager, 24 Washington street, will build a plant 200 x 200 feet, costing $750,000.

PORTAGE, WIS.—The Slinger Foundry & Machine Co. is contemplating a large addition and plans to build the foundations before winter, completing the structure early in the spring. H. W. Slinger is manager.

PORT WASHINGTON, WIS.—The Gilson Mfg. Co. has awarded contracts for a foundry and machine shop addition, 60 x 160 feet, to cost $45,000. Harry W. Bolens is president.

SCHLEISINGERVILLE, WIS.—The general contract for erecting a 1-story shop addition, 60 x 200 feet, for the Vim Tractor Co. has been awarded to Walter Tuckwell & Co., Milwaukee.

SHEBOYGAN, WIS.—The Wald Mfg. Co., will build an addition costing about $45,000 for the manufacture of automobile parts. The company recently increased its capital from $30,000 to $90,000.

SHEBOYGAN, WIS.—The foundry department of the Globe Co. has been organized as a separate corporation known as the Globe Foundry Co., with $100,000 capital, and will erect a gray iron foundry, and the present foundry utilized as a machine shop when it is completed.

TOMAH, WIS.—The board of education was authorized at a special election to spend $75,000 on a 3-story addition, 50 x 75 feet, to the high school, to contain manual training department, and a central heating plant.

TWO RIVERS, WIS.—The Suettinger Sheet Metal Works is arranging to take additional space and will purchase some new machinery.

TWO RIVERS, WIS.—A $25,000 factory addition is planned by the Wisconsin Textile Mfg. Co., which makes metal and wood supplies and appliances for textile mills. O. B. Alberts is secretary.

ALBION, MICH.—The Albion Bolt Co. has acquired the plant of the Albion Chemical Works.

ALMA, MICH.—The Northern Wheel Co., capitalized at $1,000,000, has been chartered to manufacture wheels by A. D. Smith president and Orville Allen secretary.

BAY CITY, MICH.—The Union Motor Truck Co. has awarded contracts for a plant, 100 x 500 feet, and a foundry, 60 x 120 feet.

DETROIT.—The Detroit Twist Drill Co. has awarded contracts for a plant addition.

DETROIT.—The Michigan Machine Co. has plans for a 3-story factory building.

DETROIT.—The Stroh Castings Co. is having plans prepared for a 3-story factory building.

DETROIT.—The Riverside Machinery Depot has let contracts for a factory addition.

DETROIT.—The Arthur Colton Co. has let contracts for a blacksmith shop and factory addition.

DETROIT.—The United Grinding Co. has been incorporated with $25,000 capital, to manufacture

automobile cylinders and crank shafts, by J. K. Lawrence, 1240 Jefferson avenue and others.

HAMMOND, IND.—Fire damaged the plant of the General American Tank Corp. at East Chicago, Ill. The damaged buildings include the brass foundry, car shop and insulating shop. The damage has been estimated at $300,000.

CHICAGO.—The American Insulated Wire & Cable Co. is taking bids for remodeling its plant.

CHICAGO.—The Hill Pump & Valve Co. has taken out a permit to erect a plant at an estimated cost of $150,000.

CHICAGO.—The Strandberg Bros. Co., 19 South La Salle street, will build a two and 3-story factory, 40 x 162 feet, costing $40,000.

CHICAGO.—The Cribbes & Sexton, 6680 North Sacramento avenue, has awarded contracts for an enameling plant, 1-story, 100 x 130 feet.

CHICAGO.—The Arthur Jones Electric Co., Arthur Jones, president, electrical equipment, 2837 South State street, will build a one and 2-story factory, 125 x 125 feet, costing $60,000.

CHICAGO.—Frank D. Chase, Inc., engineer, 645 North Michigan avenue, is drawing plans for a foundry addition, for the Ohio Steel Foundry, Lima, O.

CHICAGO.—The Maytag Co., 211 West Fourth street, Newton, Iowa, is having plans prepared by Architect Henry Raeder, this city, for a foundry, to cost $70,000.

CANTON, O.—The Interestate Aluminum Co. has been incorporated with $25,000 capital, by T. M. Dubbs, J. W. Fenstermaker and others.

CINCINNATI.—The Doran Bros. Electric Co. is taking bids for a plant, 2-stories, 40 x 100 feet, to cost $20,000.

CINCINNATI.—The E. H. Bardes Range & Foundry Co. is having plans drawn for a foundry addition, 100 x 100 feet, to cost $17,000.

CLEVELAND.—The F. P. Screw Co., 2279 East Seventy-seventh street, has awarded a contract for a plant, 1-story, 60 x 150 feet, to cost $40,000.

CLEVELAND.—The Lake Erie Steel & Wire Co., Bedford, O., has been incorporated, by George Keeley, Society for Savings building, and others.

CLEVELAND.—The Torbensen Axle Co. is having plans prepared for an addition to provide about 15,000 square feet of floor space.

CLEVELAND.—The K. & W. Iron Construction Co. has been incorporated with $10,000 capital, by Arnold L. Stern, L. H. Wilk and others.

CLEVELAND.—The Commercial Steel & Supply Co. has been incorporated with $100,000 capital, by A. A. Murfey, W. H. Dickey, Clinton DeWitt, Charles D. Simmons and C. B. Bayly.

CLEVELAND.—The Factory Tool & Supply Co. has been incorporated with $10,000 capital, by Arthur F. Schefft, Paul J. Weber, S. M. Schefft, P. R. Weber and Walter N. Hoppe.

CLEVELAND.—The Tool & Auto Products Co. has been incorporated with $75,000 capital, by J. D. Wiggins, Frank Chesky, L. S. Greenmun, F. W. Bachman and Fred Kramme.

CLEVELAND.—The Keystone Bolt & Nut Co. recently was incorporated with $10,000 capital, by M. E. Krejci, A. Krejci, Michael Trautman and others.

ELYRIA, O.—The plant of the Elyria Iron & Steel Co. recently was damaged by fire.

TOLEDO, O.—Erection of a foundry, 153 x 378 feet, boiler house, 40 x 50 feet, power house and engine room, 20 x 200 feet, and other buildings, are planned by the Toledo Machine & Tool Co. Contracts for the buildings have been let. Charles W. Greening is secretary of the company.

WARREN, O.—The Industrial Welding Process Co. has been chartered with $5000 capital, by Edwin J. Henke, Fred P. McBerty, Ebba V. Henke and others.

DAYTON, KY.—The Wadsworth Watch Case Co. plans an addition estimated to cost $20,000.

HARLAN, KY.—The Bowen Mfg. Co., rail clamps, has been organized with $12,000 capital, by M. I. Bowen, Arthur Thompson and others.

LOUISVILLE, KY.—The Dow Wire & Iron Co. has awarded a contract for a plant.

LOUISVILLE, KY.—Greathouse Bros. & Co. recently were incorporated with $4000 capital, to engage in the manufacture of sheet metal equipment.

LOUISVILLE, KY.—The Ovee Mfg. Co. has purchased a site on which it will build a plant addition for the manufacture of automobile supplies, at an estimated cost of $50,000.

LOUISVILLE, KY.—The Riddell Mfg. Co., sheet metalworking, has been purchased by J. W. and D. C. DeHart. The company specializes in galvanized iron equipment.

LOUISVILLE, KY.—The Byron Engineering Works, C. E. Byron, J. S. Johnson and others, is planning to install a plant for the manufacture of automobile trailers.

PADUCAH, KY.—The Alamo Machinery Co. has been incorporated with $10,000 capital by W. J. Pierce and others.

CHARLESTON, W. VA.—The Kanawha & Hocking Coal & Coke Co. will build a tipple and make other improvements.

CHARLESTON, W. VA.—The Kallmerten-Warner Electric Co. has been incorporated with $10,000 capital, by G. E. Warner and others.

CLARKSBURG, W. VA.—The West Virginia Metallic Railway Tie Co. has been incorporated with $25,000 capital, by Joseph Marra and others.

FAIRMONT, W. VA.—Mayor J. M. Boyle announces that bids will be taken for the erection of a brass mill here.

FAIRMONT, W. VA.—The West Virginia Metal Products Co., capital $2,500,000, will build a plant here to cost $1,500,000.

HUNTINGTON, W. VA.—The Ohio Valley Mine Car Mfg. Co. will build a plant 90 x 150 feet.

MOUNDSVILLE, W. VA.—The United States Stamping Co. has let the contract for an addition.

MOUNDSVILLE, W. VA.—The Cameron Tool Co. has let the contract for an addition.

NEW CUMBERLAND, W. VA.—The West Virginia-Pittsburgh Coal Co. will build a power plant here to cost $100,000.

PARKERSBURG, W. VA.—The Donovan Boiler Works has started work on a plant.

PARKERSBURG, W. VA.—The Baldwin Tool Works has let the contract for a factory, 40 x 139 feet.

WELLSBURG, W. VA.—The Wellsburg Light & Power Co. will rebuild its plant here to cost $100,000.

WHEELING, W. VA.—The J. E. Moss Iron Works will build a plant, 125 x 250 feet.

WHEELING, W. VA.—The Wheeling Stamping Co. is arranging to build a plant in this city to cost $30,000.

Business in Canada

WINNIPEG, MAN.—The Twin City Separator Co. has started work on a 3-story machine shop and warehouse to cost $75,000.

LOUISBURG, N. S.—The Louisburg Drydock & Shipbuilding Co. will start early in 1920 on a drydock here to cost about $5,000,000, according to J. W. Maddin one of the company incorporators.

SYDNEY MINES, N. S.—The Nova Scotia Steel & Coal Co., New Glasgow, N. S., will erect a by-products plant here.

COWANSVILLE, QUE.—The Colonial Machinery Co. has been incorporated to manufacture machinery, tools, iron, steel, etc., with $50,000 capital by Harry R. Fraser, Frederick S. Rugg, Charles de L. Mignault all of Sherbrooke, Que., and others.

LONGUE POINT, QUE.—The Montreal Locomotive Works, Ltd., 145 St. James street, Montreal, has awarded contracts for five factories here to cost $212,000.

BRIDGEBURG, ONT.—The King Separator Works, Ltd., has been incorporated to manufacture cream separators, etc., with $50,000 capital by Edward H. Neelon, George F. Peterson, Frank N. Ritherford and others.

CHATHAM, ONT.—The springs building of the Dowsley Spring & Axle Co. recently was damaged by fire, with a loss estimated at $50,000.

HAMILTON, ONT.—The Dominion Sheet Metal Co., 1322 Burlington street, has let the general contract to W. H. Cooper, Clyde building, for a $25,000 addition.

HAMILTON, ONT.—The Frost Steel & Wire Co., Sherman avenue north, has let the general contract to W. H. Cooper, Clyde building, for an addition to cost $28,000.

HAMILTON, ONT.—The Burlington Steel Co., Sherman avenue north, has awarded the general contract to the Canadian Engineering & Contracting Co., Bank of Hamilton building, for an addition to cost $12,000.

NIAGARA FALLS, ONT.—The Niagara Wire Weaving Co., Ltd., care of C. M. Borter, architect, 102 Main street, has let the general contract on a factory to cost $60,000.

TORONTO, ONT.—W. C. Shunk, 43 Bellevue place, is making preparations to start work on a machine shop and garage.

TORONTO, ONT.—The Northern Aluminum Co., 158 Sterling road, has let the general contract for a $250,000 plant addition.

TORONTO, ONT.—The plant of the Holden-Morgan Co., 579 Richmond street west, machinists supplies, etc., recently as damaged by fire.

TORONTO, ONT.—The Crompton Car Co., Ltd., has been incorporated with $25,000 capital, to manufacture automobiles, motors, machinery, etc., by Murray H. Gillam, 773 Indian road; Morley P. van de Voort and others.

TORONTO, ONT.—The Buchanan-Duncan Motors, Ltd., has been incorporated by John Jennings, 67 Yonge street; James Buchanan, George H. Lovatt and others with $40,000 capital, to manufacture motor cars, machinery, tools, engines, etc.

TORONTO, ONT.—The Belt Grip Pulley Co. of Canada, Ltd., has been incorporated by Daniel J. Coffey, 67 Yonge street; Hugh J. Harkins, John T. Coffey and others, with $200,000 capital to manufacture pulleys, castors, trucks, carriage wheels, etc.

WALKERVILLE, ONT.—The new plant of the Canadian Products, Ltd., the Canadian subsidiary of the General Motors Corp., is rapidly nearing completion.

WESTON, ONT.—The Canada Cycle & Motor Co., Weston road, has let the general contract to the John V. Gray Construction Co., Ltd., Confederation Life building, Toronto, for an addition.

WINDSOR, ONT.—The Charles A. Strelinger Co., of Canada, Ltd., has been incorporated to manufacture machinery, etc., with $100,000 capital by Charles A. Strelinger, Charles T. Bush, Charles E. Allinger all of Detroit, Mich., and others.

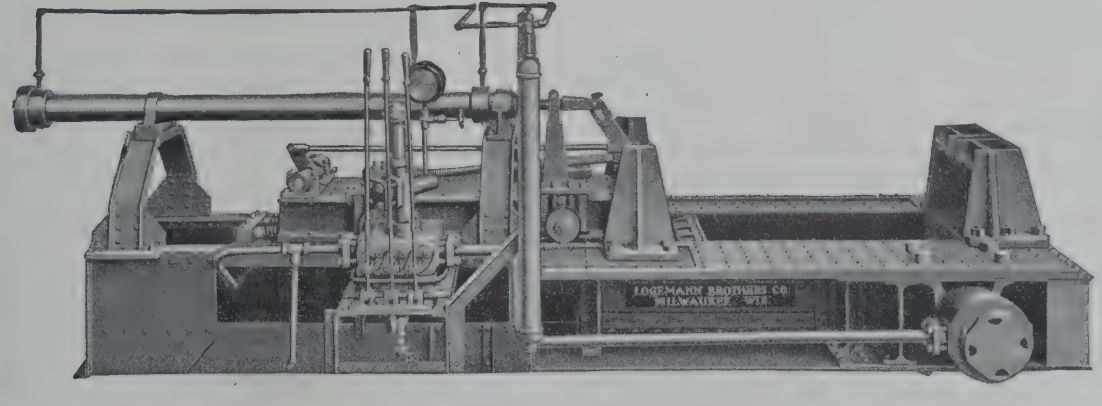
When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

Logemann Brothers Co.

Milwaukee, Wis.

Builders of Baling Presses and Hydraulic Machinery

New Trade Publications

OIL ENGINES.—The various parts of Diesel type oil engines, manufactured by the Allis-Chalmers Mfg. Co., Milwaukee, are illustrated in a 32-page booklet which the company recently published. It should be of value in ordering repairs and spare parts for engines of this type.

REFRACTORY MATERIAL.—The Quigley Furnace Specialties Co., New York, has published an 8-page illustrated booklet in which a refractory plastic material for bonding fire brick and kindred uses, is described and illustrated. The booklet is replete with testimonials, illustrations, etc., pertaining to the use of this material in the foundry.

MACHINE TOOLS.—The Saint Louis Machine Tool Co., St. Louis, has issued catalog No. 16, in which grinding, polishing and tapping machinery, manufactured by the company is described and illustrated. Specifications of the various machines are given as well as the various accessories, which also are illustrated.

WIRE WORK.—A 36-page illustrated booklet is being distributed by the Fred J. Meyers Mfg. Co., Hamilton, O., in which wire, iron, brass and bronze work is described. Products on which detailed information is given include machinery guards, window guards, railings, enclosures, signs, iron stairs, iron doors, fire escapes, iron fencings and gates. Each product described is illustrated.

SINTERING.—An interesting booklet on sintering and desulphurizing iron ore materials, recently was published by the American Ore Reclamation Co., New York. The booklet tells of the work of the sintering plant in its relation to the iron and steel industry, gives a description of a modern sintering plant, which is profusely accompanied with illustrations. Four line drawings in the back of the book, give the reader a comprehensive idea of various sintering machine plant layouts.

SAND MIXER.—The National Engineering Co., Chicago, is circulating an 8-page booklet in which a sand mixer is described and illustrated. The mixer consists of a stationary circular pan, in the center of which is located a vertical shaft, to which is keyed a central supporting casting or cross head. This casting rests on a turret in which are the bearings for the central shaft, which is operated by bevel gearing located below the machine. The supporting casting carries the plows and mullers. By means of a door located in the bottom of the pan, which is operated by a lever, the discharging of the sand from the mixer is easily accomplished.

REFRACTORY SAND.—A small booklet just published by the Quigley Furnace Specialties Co., New York, is devoted to a refractory granular material for use in lining and repairing, annealing furnaces, forging furnaces, heating furnaces, open-flame melting furnaces, pit-crucible furnaces, tempering furnaces, furnace doors, ladle heaters, coke-oven floors, gas retorts, flues and chambers, glass lehrs, and to make standard and special shapes for furnace walls, arches, crucible blocks, gas carburetors, etc. The material, according to the booklet, is manufactured in the electric furnace by fusing at a high temperature, a mixture of natural silica and petroleum coke. The booklet contains a number of illustrations.

CENTRIFUGAL PUMPS.—Efficiency, accessibility, durability and ruggedness of construction have been given careful consideration in a bulletin devoted to centrifugal pumps and centrifugal pumping units, recently published by the Allis-Chalmers Mfg. Co., Milwaukee. These pumps have been developed to meet pumping requirements such as city water supply, sewage pumping, service in filtration plants, underwriters fire pumps, condenser pumps, paper mill stock pumps, and for a variety of uses in modern industrial plants. The booklet is profusely illustrated and contains speed tables and charts. One part of the booklet is devoted to instructions for installing and operating horizontal centrifugal pumps. Four types of pumps manufactured by the company are described in the booklet.

MARINE BOILER DATA.—An illustrated 69-page book entitled, "Marine Boiler Logic," recently was issued by the Heine Safety Boiler Co., St. Louis. The booklet is the work of Charles H. Stoddard, consulting marine engineer for the Heine company. The main part of the book relates to the design and construction of Scotch and watertube boilers for marine installations. Evaporative capacities are worked out for the two types using coal or oil as fuel with natural or forced draft. The booklet also contains a discussion of power and speed of cargo vessels, formulas being developed showing the relation between the boiler and prime mover capacity and the dimension of the hull. In making these computations, the method developed by Rear Admiral D. W. Taylor of the United States navy has been used, with certain modifications suggested by Mr. Stoddard's experience. The last part of the book is devoted to a description of the construction and operation of the cross-drum type of watertube boiler developed by the Heine company for marine service.

TWIST DRILLS.—"Putting Mettle into Metal" is the title of an unusually attractive booklet recently issued by the Clark Equipment Co., Buchanan, Mich. The publication is devoted chiefly to descriptions and illustrations of the industrial community in which the twist drills manufactured by this company are made. The plant of the company consists of modern, well lighted buildings situated in a beautiful park and surrounded by a number of institutions designed to promote the welfare of the employes. The theater, built "to provide a suitable place for all the recreational activities of the plant" accommodates 1000 persons and is used for dances, musicales, plays, etc. It is readily transformed into a basketball court. Homes for employes, ranging in cost from $2500 to $4500 have been built and sold to employes. A well equipped hospital has been provided and turned over to an association formed among employes. The latter part of the booklet is devoted to illustrations and descriptions of the various operations through which a twist drill passes before it reaches the shipping department. A list of the sales agents of the company in the United States and foreign countries is given.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

A resident English commercial agent in Colombia desires to secure agencies for the sale of typewriters, low-priced motor cars, etc. Opportunity No. 30677.

A firm in Roumania desires to purchase technical articles, such as asbestos packings, hemp packings, rubber articles, transmission belts, cast iron water pipe and ventilators, blacksmiths' articles, pumps, agricultural and flour-mill machinery, oil well suplies, motor machinery, electrical apparatus, machinery and tools for woodworking, etc. Opportunity No. 30679.

Prices and illustrated catalogs are desired by a man in Czechoslovakia, of machinery for pressing and manufacturing lead pipes, etc. Opportunity No. 30684.

A company in Spain desires to secure an agency for the sale of iron and steel plates, tin plate and other articles. Correspondence should be in Spanish. Opportunity No. 30655.

A resident of the Philippine islands desires to establish a small plant for the manufacture of rope and wishes to secure available information as to cost of machinery, instructions as to its care, etc. Opportunity No. 30656.

A sales agent in Salvador desires to secure agencies for the sale of corrugated, stamped and plain iron sheeting, and expanded metal for building purposes. Opportunity No. 30661.

An agency is desired by a man in Switzerland for the sale of agricultural products, tools and machinery, etc. Correspondence should be in German. Opportunity No. 30587.

A party in India desires to purchase and secure agencies for the sale of bolts, nuts, screws, nails, both wire and cut, hinges, door handles, knobs, hooks and staples, paints, varnishes, locks, builders' hardware, carpenters' tools and galvanized buckets. Opportunity No. 30660.

A firm in Czechoslovakia desires to purchase and also secure an agency for the sale of agricultural implements. Correspondence should be in either Polish or Russian. Opportunity No. 30559.

The American office of a firm in Sweden desires to be placed in communication with manufacturers with a view to securing agencies for the sale of agricultural machinery, belting, cutlery, technical and industrial machinery, locomotives, textile machines, railway supplies, construction materials, motor trucks, engines, steel, iron, coal, etc. Opportunity No. 30590.

An American export corporation is soon to send a representative to Europe and invites offers of manufacturers of iron and steel articles, hardware, machinery, farming implements, etc. Opportunity No. 30592.

A firm in Italy desires to purchase mechanical toys, optical instruments, thermometers and scientific toys, such as steam engines and electric railways. Correspondence should be in Italian or French. Opportunity No. 30596.

A mechanical engineer in Italy desires to secure an agency for the sale of builders and general hardware, tools, metals, mechanical goods, etc. Correspondence should be in Italian. Opportunity No. 30560.

The electrical engineering department of a municipality in South Africa requires electrical supplies, boiler tubes, centrifugal pump and motor, ammeters, transformers, etc. Opportunity No. 30566.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, October 2, 1919 No. 14

Drift of Men is Back to Works

Developments Favor Employers and Slow But Certain Progress is Being Made in Breaking Backbone of Strike—Consumers of Steel Co-operate With Mills—No Serious Dislocation of General Industry Yet Evident

SLOWLY but with clearly marked progress, the vicious assault upon the iron and steel industry by radical agitators wielded mainly through the foreign workmen, is being repelled and broken. The week's developments taken as a whole have been definitely favorable to the employers. With some large companies having various plants the actual gain in the number of men at work has averaged from 20 to 25 per cent in that period. The Pittsburgh district, the pivotal ground in the present struggle, shows a record of sustained improvement in operations while efforts of the strikers to win over certain large plants which had been running practically full from the first, have been resisted successfully. In the East the strike has lost rather than gained ground despite the much-heralded attack upon the Bethlehem Steel Co. All evidence of it practically has disappeared in the South where it has ceased to be a factor. At Chicago no serious attempt yet has been made by the steel companies to enlarge their operations and production is only slightly better. The drift of the men back to the works has begun at Buffalo. Cleveland and the Mahoning valley remain the most affected points and virtually every plant in those territories is idle. It is significant that where police protection to the workers has been most uncertain or inadequate the suspension of the industry has been the most pronounced. In some districts the employers are initiating steps to win back the men but generally they continue to pursue a passive attitude and the belief apparently is entertained that the psychological moment for this has not arrived.

Buyers Back the Mills

Consumers of steel, realizing that the issues at stake vitally concern their own interests, almost without exception are throwing their support to the producers and are refraining from pressing for deliveries or otherwise embarrassing the mills. This co-operation has simplified greatly the problem of the producers in spreading about their reduced tonnage. At the same time a prolongation of present conditions is certain to bring dislocation and distress to various lines of industry though nothing of an acute character yet has appeared. Generally the mills are accepting no new business except for indefinite delivery.

Iron Brings Premiums

While merchant pig iron production has recovered considerably in the week, especially in the Shenango valley, prompt iron is being sought by many consumers whose shipments have been cut off. This is more noticeable in consuming territory drawing upon Cleveland and Buffalo furnaces. At Cleveland buyers have paid $3 to $3.50 premium for prompt iron. Higher prices also have been paid for Buffalo iron. The principal transaction of the week was the purchase from eastern furnaces of 45,000 tons of basic at about $27.50, delivered, by the American Bridge Co. for its Pencoyd plant. This was due to the fact that this consumer's regular source of supply in the Pittsburgh district has been interrupted.

Export Sales at Record

September established a new record in the volume of export iron and steel sales. With mill output on this side now curtailed and shipping facilities reduced by the British rail and dock strike, sellers are advising buyers to hold off from further purchases at this time. Japan is inquiring for car trucks requiring about 11,000 tons of steel. The Cuban Central railroad has closed for 400 freight cars. Belgium has asked prices on 11,000 tons of pig iron but European makers undoubtedly will take this business.

Inability of many mills to keep up with contract obligations has directed a flood of business upon warehouse stocks. In some districts these supplies rapidly are being cleaned out and it is predicted that several weeks of present conditions will leave the jobbers of the country practically bare of steel supplies. Warehouse price advances have been put in effect at Boston and New York.

Jail the Agitators

A CALM, dispassionate survey of the facts brought to light in connection with the iron and steel strike must convince any fair-minded, intelligent American that the strike is one of the greatest crimes ever perpetrated in the name of organized labor. It represents a stab in the back for an industry that is in the forefront of effort to advance the interests of the laboring man by improving human relations and insuring the man who toils just consideration and compensation.

Besides the means taken by employers to make their employes feel satisfied, other agencies were offered to employes insuring in the end impartial settlement of any grievances which they might have held. Yet swayed by influences wholly inimical to their welfare a minority of employes took a step that precluded the possibility of a settlement in their favor and attempted to put into practice a policy of rule or ruin.

A virtual mandate was issued on the President of the United States. Viewed from the standpoint of the interest of organized labor this was a most stupid blunder. The action taken by the leaders of the strike movement in the iron and steel industry has served to discredit the federation in the minds of all employers who were disposed to treat with it. Assuming those leaders will be defeated in their purpose, an assumption based on the conviction that the rights of Americans will be upheld, we may expect to hear at some future time that the federation again has become converted to sane principles and has cleaned house.

President Gompers and some of the leaders reputed to be conservative have not only condoned the strike, against which they advised, but the former publicly has set the seal of his approval on a dangerous enemy of the government. The play of politics in the federation has shown how much reliance may be placed on it in a more serious situation. The very men who have been extoled as the bulwarks of this country against bolshevism are the first to compromise with it. The spectacle of Gompers before the senate investigation committee vouching for Foster must raise doubts as to his sincerity or his judgment.

The testimony before the senate committee, revealing as it did the inner workings of the federation, proved what has long been known by employers, that the federation cannot be held to its most solemn obligations, and yet employers are criticized by the federation for refusing to compromise with it on a principle as deep-rooted as the constitution of the United States.

Arbitration as proposed by Fitzpatrick does not contemplate an agreement in regard to wages and hours for working which the federation of labor would be bound to respect, but a compromise on principle with the men of the I. W. W. type, with whom there can be no compromise. If any doubt remains in the minds of Americans as to type of men with whom the employers have been asked to compromise let them understand what is being said and done by organizers working for Fitzpatrick and Foster to undermine safe and sane government. In this issue The Iron Trade Review presents some of the statements made by these men in public meetings. It has developed that the department of justice has had agents at their private meetings, and it is significant that the latter last week raided a meeting of bolsheviks in the heart of the strike district in East Youngstown, confidentally expecting to catch certain leaders of the federation's strike movement.

It is apparent that some connection has been established between the rankest of the radicals, the syndicalists, the Independent Workers of the World and the bolsheviks, with the active heads of the steel strike. In view of what is being said in public it would not be too much to demand that if the department of justice does not see fit to proceed against the agitators it at least submit to some responsible body such as congress the evidence that its agents have collected at the private meetings. The public itself then may judge whether some of

the self-ordained leaders of the American workingman should not be put in jail.

Teach the Workman Business Truths

WRONG conceptions of business fundamentals, confusion of gross and net incomes, and acceptance of the doctrine fostered by the radicals and the wilful disturbers that the employer's profit from a workman's daily toil is many times the latter's wage, are elements of a distorted perspective of labor that is proving one of the underlying causes of the present unrest. This perspective is being created and molded by agitators whose only hope for success lies in stirring the emotions of the ignorant and unthinking.

Individual workmen are led to believe that they earn every day from $5 to $60 for their employers and in many instances the case is "proved" by holding up the figures of gross earnings. A study of the reports of four great steel companies reveals that the net profits of each for 1918 were equivalent to between $1 and $2 a day for each employe, while in the June quarter of 1919 they were equivalent to less than $1 for each employe.

The agitator too long has been the only advocate in court. The time has come for the employer to take his side of the case to his men, for, by his indifferent silence, he is permitting them to accept the deception and the insidious doctrines of the preachers of unrest.

Refutation of the preposterous contentions of industrial disturbers, and a frank, clear explanation of the simple fundamental truths of business finance would go far in purging the air of bolshevist poison. The ardor of gullible workmen for the communistic Utopia, which they now believe would bring them riches and leisure, would vanish in a twinkling were they made to see that equal division of the fund now going to capital would net them but a few cents a day additional income.

Groups of men will ever heed the call of leadership. It remains for employers to provide healthy, enlightened mutually helpful leadership from within, or see the allegiance of employes drift into the camp of radical, outside agitators. Where an honest desire to treat men fairly and squarely exists, nothing is to be lost by laying the cards upon the table before them; indeed everything is to be gained by such a course.

Questions Which Need Answers

ON AUG. 8, the government issued an inventory of 1036 tools with fixed prices based on their service value. The list included machines from three divisions; the aircraft service, the motor transport service and the general ordnance department. It is understood that the tools belonging to the three bureaus were to be pooled and that instructions were issued that the latter were to cooperate with each other in expediting the marketing of the federally-owned equipment. Each was to be able to offer and sell the others' machines.

How this very excellent plan, the result of weeks and months of study and consideration by the machine tool section of the war industries board at Washington, is working out, is a matter about which little is being heard. The inventory as issued embraced the necessary data in convenient form, giving the size, number, type, price and condition of each tool with its location. Notwithstanding this fact, efforts by dealers to buy various tools have resulted in practical failure. The way the proposition apparently is being handled but emphasizes the lack of business-like methods, described on page 337 of the Aug. 7 issue of this publication in an article which was inspired by the widespread indifference among tool buyers toward government-owned machines.

A few weeks ago a prominent new and used machinery dealer, in the Middle West endeavored to purchase some federally-owned equipment. He describes his experiences as follows, the type of machine mentioned being substituted:

> We found three 42-inch vertical boring mills listed in the government's inventory and immediately endeavored to purchase them from our local ordnance department for our customer, who needed them immediately. The ordance department ascertained by wire that but two of the tools were available. Our order with certified check was sent. A telegram stating that the tools were sold brought a further wire from the air service division stating that neither of them could be located. Notwithstanding all our efforts to obtain the tools, we were unsuccessful.

Is it to be taken for granted that certain army officers have been entrusted with the highly important duty of disposing of the government's equipment? Can it be that through fear of working themselves out of their jobs, these officers are unfair to the government and its people in general and its machine tool industry in particular? Can it be possible that one division refuses to sell through another, simply because the bureau which made the sale would receive the credit for it and the one holding the title to the equipment would not?

These are questions which are running through the minds of those who have made efforts to consummate deals with these governmental agencies. They are questions which should be met and answered by the several departments in question before they can hope to be successful in their effort to dispose of the government-owned machinery which now has been idle over 10 months.

Corporation Buys Basic in East

American Bridge Co. Cut Off From Regular Pittsburgh Supply Closes For 45,000 Tons at About $27.50 Delivered—Spot Iron in Demand and Premiums up to $3.50 are Paid—Furnaces Resume

Philadelphia, Sept. 30.—A sweeping change has developed in the eastern basic market by reason of large purchases of the grade by American Bridge Co. Unable to get its usual shipments from the Pittsburgh district, this interest has purchased 45,000 tons all for spot and nearby delivery from eastern makers. Various prices paid for this iron establish the market at $27.50 delivered Pencoyd and other eastern Pennsylvania points. However these purchases thoroughly have cleaned up supplies so that it is doubtful whether the price could be duplicated. One maker who expects to have basic for market in month or two says he would not sell less than $28 furnace and another will not sell at less than $30 furnace. Foundry iron by reason of the fact that the furnaces all are well sold up also is much stronger. The minimum in eastern Pennsylvania now is $30.25 furnace No.for No. 2X (2.25 to 2.75 silicon) and $29 for No. 2 plain (1.75 to 2.25 silicon. The central Pennsylvania group is $29.50 furnace for No. 2X but as high as $31 and $32 eastern Pennsylvania furnace is being done on No. 2X. The strike situation in Buffalo is enabling some sellers having stock iron there to obtain from $29 to $30.25 Buffalo for No. 2X for spot shipment to New England. Fair amount business is being done in foundry iron. It includes some lots of 1000 tons or more but is made up mostly of smaller tonnages most of it is for this year as on next year, most furnaces yet are unwilling to quote. Some makers are asking as high as $33 eastern Pennsylvania furnace on No. 2X for first quarter and first half. Virginia iron being sold by one maker at $30 furnace for No. 2X. Western consumers are paying high prices for high silicon Virginia based on $26.75 furnace for No. 2 plain plus differentials. Virginia high silicon now is practically sold up. Low phosphorous sales include one lot of 100 tons of standard iron and two lots copper-bearing totaling 500 tons. Low phosphorus prices are unchanged.

Strike Cuts Off Orders

Boston, Sept. 29.—Steel strike conditions together with the withdrawal of most of the offers of 1920 pig iron from the New England market have caused a decided drop in sales during the past week. Several of the Buffalo furnaces are so seriously affected by strike conditions that no orders at all are being accepted. In the case of two furnaces all deliveries have stopped, due to the fact that railroads will not take cars which stand loaded in the yards. Eastern Pennsylvania furnaces however have not been affected, except indirectly, and iron for the last quarter has been sold in about the normal amount. Only a few small furnaces are offering any 1920 iron and the prices in these cases are from $1 to $1.50 above this year. An eastern Massachusetts machine tool manufacturer bought 200 tons of 2X eastern (2.25 to 2.75 silicon) at $31 eastern Pennsylvania furnace, for first quarter and other sales for 1920 have been made at practically the same delivered price. Greater activity has been reported from the Virginia district and many small sales for prompt shipment and last quarter have been made. The price in most cases has been $30 furnace for No. 2X (2.25 to 2.75 silicon). The Virginia Iron, Coal & Coke Co. is quoting $30 on both 1.75 to 2.25 silicon and 2.25 to 2.75 grades. Some Alabama iron has been sold to New England consumers during the week at the level established two weeks ago. No large tonnage orders have been reported from any section although the Draper Corp. has been known to have closed for part of its requirements at least and to have further inquiries out. One Massachusetts consumer bought 1000 tons of No. 2X eastern (2.25 to 2.75 silicon) for last quarter at $32.90 delivered. The Whitin Mfg. Co., Whitinsville, Mass., placed orders for part of its requirements of 4000 tons and the Walworth Mfg. Co., Boston, is understood to have bought 1000 tons of malleable. Prompt iron is becoming scarcer. Total sales of the week through New England representatives are estimated at 8000 tons.

Forward Demand is Active

New York, Sept. 30.—Although practically none of the eastern furnaces has opened books for delivery after Jan. 1, the inquiry for such shipment is growing steadily, and the makers in most cases have been requested to notify numerous customers as soon as they are ready to take such business. Sales for deliveries after this year still are exceptional. The furnaces do not desire to make contracts for forward delivery until the present strike has come to an end. The only effect of the strike on the eastern pig iron market so far has been the crippling of the Buffalo district, which is preventing certain furnaces there from making shipments. The furnaces also are still too much in the dark as to their future costs for them to sell large tonnages ahead. Only one eastern furnace has been a forward seller during the past week. This interest, a Lehigh valley maker, has sold several thousand

tons of foundry iron for first quarter at $30, furnace, for 1.75 to 2.25; $31, furnace, for 2.25 to 2.75, and $32, furnace, for 2.75 to 3.25 silicon. Most of the business involved foundry iron for spot and nearby shipment. Numerous sales were included, most of them ranging from a carload to a few hundred tons. Several lots of 1000 to 2000 tons also were included. The biggest transaction involved 5000 tons which the Crane Co., Bridgeport, Conn., bought for delivery over the rest of this year. A feature of the business in foundry iron during the past week has been the ability of sellers to obtain higher prices for the rest of this year. Several sales were made by eastern Pennsylvania furnaces at $31 and $32, furnace, for 2.25 to 2.75 silicon.

Little Doing Except in Foundry Iron

Pittsburgh, Sept. 30.—Practically the only activity that is noted in the pig iron market is in foundry grades, though there have been rumors that some of the steel manufacturers whose blast furnaces are banked as a result of the defection of common labor, have been looking around for bessemer and basic. The National Transit Co., Oil City, Pa., recently closed on 3800 tons of foundry, part of which was No. 2X (2.25 to 2.75) and part No. 3 (1.25 to 1.75), the business being placed at regular market prices or $28 for No. 2X and $25.75 furnace for No. 3. The Westinghouse Machine Co. also has closed on its last quarter requirements of foundry but details as to tonnages, grades and prices are not available. The Standard Sanitary Mfg. Co. which recently put out an inquiry for 1000 tons of foundry, equally divided between No. 2X and No. 2 grades for its Louisville, Ky., plant has not yet closed. Foundries not much disturbed by the steel plant strike are pressing furnace interests for deliveries against contracts and in addition a number of inquiries have come from melters in doubt about getting shipments against contracts. One seller reports inquiries aggregating more than 5000 tons. From an operating standpoint the situation is much improved. While the furnace of the Weirton Steel Co., for the present a merchant stack is down, practically all of the merchant producers in the Shenango valley again have their furnaces blowing. Two of the stacks of the Shenango Furnace Co., at Sharpsville, Pa., and the Sharpsville Furnace located in the same place, operated by Allen S. Davison & Co., Pittsburgh, are banked, these being the only inactive furnaces in that section.

Spot Iron Brings Premiums

Cleveland, Sept. 30.—Spot iron is in sharp demand from consumers in this district due to the shutting off of shipments from various furnaces banked because of the strike and premiums are being paid. Southern Ohio iron has been sold in this district at $29.75 furnace for 1.75 to 2.25 silicon, equivalent to $32.35 delivered. This represents a premium of $3 to $3.50 over the previous market. One maker has been disposing of misfit grades but has asked no premium and is selling at the usual differentials under the base price. No iron is being shipped from the four furnaces of the McKinney Steel Co. or the two stacks of the Cleveland Furnace Co. this city, all of which continue banked. Some of the furnaces report difficulty in getting out iron from the yards because of car shortages and the rush of ore shipments. Stocks of those furnaces which are able to ship are being cleaned up more rapidly under prevailing conditions. Various steel plants which have been closed or crippled by the strike continue to hold up shipments of basic. Notwithstanding this fact one of the largest interests with headquarters here reports that its shipments in September were the heaviest of the year. Some selling for 1920 continues but it is limited. One maker in addition to a 6000-ton lot of foundry iron reported previously took about 4000 tons in the week, for that delivery.

Prompt Iron in Demand

Chicago, Sept. 30.—With merchant stacks in Chicago completely out of service deliveries of pig iron have ceased and even iron on yards at furnaces is not being loaded and shipped. Melters generally have sufficient supply to care for immediate needs and are not worrying about the future in this respect. However, prompt iron on wheels from south and east is finding ready sale and moves as soon as offered, even at much higher price than local iron has commanded. A southern seller is offering last quarter iron for $28, Birmingham, for silicon 1.75 to 2.25 and $29.10, Birmingham, for silicon 2.25 to 2.75, though the latter grade is rather scarce. The same interest is offering first quarter delivery at $28.50, Birmingham, for silicon 1.25 to 1.75, $29 for the next silicon grade, $30.10 for 2.25 to 2.75 and $31.20 for silicon 2.75 to 3.25. A Tennessee producer of silveries is nearly sold out for 1919 delivery and has not opened books for 1920. The present schedule for silveries from this producer is $39.75 for 6 per cent, $41.25 for 7 per cent and $2 additional for the next two steps. Freight is $3.40 to Chicago.

Take 1920 Business at $28

Cincinnati, Sept. 29.—A considerable tonnage of foundry iron for nearby shipment is changing hands. Sales for delivery this year are being made in territory ordinarily supplied by some of the lake furnaces that are closed on account of the strike. A few southern furnaces have quietly taken on some first quarter business at $28, Birmingham, for 1.75 to 2.25 silicon, and at $29.10 for 2.25 to 2.75 silicon. However, most of the furnaces seem to have set $30 as minimum for next year's business, based on 1.75 to 2.25 silicon. Practically all of the spot iron offered in the Ironton district at $27.50 for 1.75 to 2.25 silicon has now been disposed of, so that $28 now seems to be minimum in that field.

Speeding Up Production in South

St. Louis, Sept. 27.—The local pig iron market has not felt the affects of the strike. Foundries and mills are operating as heretofore, and most of them are likely to continue doing so, for the reason that the greater part of supplies used in this district are drawn from southern furnaces. Selling agencies of southern makers report that their principals are preparing to speed up production. Northern shipments are slowing up, and the same is true of consignments from the East. Consumers are buying all the iron they can get, and demand for prompt shipment is the best it has been in a number of weeks. It is understood several leading foundry interests have offered liberal premiums. The opening of books by southern furnaces for 1920 business will be indefinitely delayed.

Southern Market Satisfactory

Birmingham, Ala., Sept. 30.—The pig iron market in the South is in a satisfactory condition. There is a steady demand, and inquiries are in hand for a large tonnage for 1920 delivery. The attempt at a strike of the iron and steel workers at plants of the Tennessee Coal, Iron & Railroad Co., and the American Steel & Wire Co., was a failure and did not in the least affect production of pig iron. The output of iron in Alabama in September will show an increase in comparison with August. Prices have been firm, on a basis of $28 for No. 2 foundry (1.75 to 2.25 silicon). General selling into 1920 will probably be noted within the next two to three weeks. Inquiries received indicate there would be no strong resistance by buyers to a price of $30 per ton. Furnace companies are convinced that there will be a demand for every ton of pig iron that can be manufactured.

Stocks Droop

Warehouses Undergo Heavy Demand —Prices Raised

Cleveland, Sept. 30.—Warehouse stocks in Cleveland are being cleaned out rapidly under the sharpened demand from consumers which has been caused by the strike. Some of the largest local interests now are without supplies to meet the requests coming in upon them and are refusing many orders. The Carnegie Steel Co. is limiting individual warehouse orders as a general rule to three tons. Some local consumers have been obliged to go to Chicago to fill their needs.

Boston Prices Up

Boston, Sept. 30.—Warehouse prices are rapidly stiffening owing to the slower delivery from the mills. Galvanized sheets No. 28 gage have been advanced to 7.50c from 7.10c, and No. 28 black to 6.15c from 5.90c.

Blue Annealed Advanced

New York, Sept. 30.—An advance of 25 cents in blue annealed sheets, effective today has been announced by a leading warehouse interest here. The new price is $4.82 per 100 pounds, New York. This increase follows a heavy demand, which, as a matter of fact, extends to bars. Structurals and plates also are moving in better volume than heretofore.

Fall Back on Stores

Chicago, Sept., 30.—With current delivery of finished steel considerably interfered with by the strike, much structural material is being sought

from the steel warehouses, the difference in price not being counted against the convenience of obtaining material promptly. This applies not only to routine lots for small construction needing only a few pieces, but to larger supplies which are being taken for structures which usually would be bought through the mill. As a result of the strike condition, warehouse business is noticeably heavy.

No Orders

Being Taken by Makers of Wire Products—Eastern Output Good

New York, Sept. 29.—Although considerable of the wiremaking capacity of the country has been rendered idle by the strike, the industry is by no means prostrated. This is particularly true in the east where all the wire mills are operating at the same rate as before the strike was called and have not been interfered with in filling their orders.

Makers Out of Market

Pittsburgh, Sept. 30.—Manufacturers of wire and wire products are out of the market as far as new business is concerned, curtailment of production resulting from the strike permitting of no other course as far as the leading interest is concerned. The Pittsburgh Steel Co. plant and those of the Cambria Steel Co. and the Youngstown Sheet & Tube Co. are down. The Jones & Laughlin Steel Co. thus far has been unaffected in most departments by the labor distubances and its wire mills are among that part of the works which is running regularly.

Reduced Output

In Semifinished Material Well Balanced by Lighter Consumption

Pittsburgh, Sept. 30.—Production of billets, sheet bars and other kinds of semifinished steel has suffered from the suspensions brought about by the strike, but probably no more so than finishing mill capacity and as a result few of the active rolling mills are suffering for want of supplies. Some demand is coming to makers of billets and sheet bars from finishing mills whose regular sources of supply are cut off, but such inquiries are not receiving much attention at the moment.. Inquiry for 1000 tons of standard bessemer billets is noted from a Pittsburgh maker of tool steel. Few wire rods are available on the open market at present.

Strip Makers Operating

Pittsburgh, Sept. 30.—Most of the makers of strip steel in this district have been unaffected by the strike as far as the loss of men is concerned and are running full. Little effort is being made to secure new business as current bookings probably will absorb production over the remainder of the year.

Coke Prices are Reduced

Large Tonnages Thrown Back on Producers by Suspension of Blast Furnaces — Standard 48-Hour Beehive Sold at $3.50

Pittsburgh, Sept. 30.—Anxiety on the part of beehive coke producers to find an outlet for tonnages thrown back on their hands as a result of the suspension of blast furnaces, due to the strike, has resulted in sharply lower prices than recently prevailed. While some merchant blast furnaces have resumed they appear to have had considerable supplies of coke both on hand and on wheels and have not been buying coke or ordering a resumption of shipments against contracts. The only outlets, therefore, have been to consumers who are in a position to stock some tonnage, or for export. Sales involving about 8000 tons are reported for export, and a fair amount of coke has been bought for stocking, but the combined business has made only a small dent in the accumulated supplies. The result is a dull and unsettled spot situation with prices largely in favor of buyers. As low as $3.50 has been done on loaded cars of standard 48-hour beehive coke and there is no basis in sales for a price on this grade of higher than $4, although a few of the larger producers continue to quote as high as $4.75. Two sales of 100 cars each were $3.85 ovens. Spot sales of by-product furnace coke are reported as $3.75. The Carnegie Steel Co. is managing to keep its Clairton by-product plant running about 75 per cent of capacity, and is producing enough coke to meet the requirements of the blast furnaces ordinarily served by these ovens. A number of the ovens of the H. C. Frick Coke Co., are inactive, because of the relatively full operations of the Clairton plant. No contract business is being done in furnace coke and quotations merely are nominal. A little foundry coke might be picked up at $5.50, ovens, but in general, the market on this grade has not been much affected by the strike and basis in sales still exists for a quotation as high as $6.50. The *Connellsville Courier* estimates coke production for the week ended Sept. 20, at 258,801 tons, against 259,900 tons in the previous week.

Foundry Coke Prices Firm

Cincinnati, Sept. 29.—The expected increase in production in the Connellsville district, as compared with consumption, is not up to estimates made a week ago. More foundry coke is being turned out because of the reduced consumption of furnace coke, but on account of the car shortage the fuel is not moving very fast. No effect on foundry prices is noticed and leading interests continue to quote from $6 to $6.50 per ton, ovens. New River and Pocanhontas are both scarce, although some spot foundry sales are made in the last named field. Wise county producers are making a little headway in catching up on shipments, and some spot foundry coke is also available in that district. New River foundry coke is still as high as $9 to $9.50. Wise County and Pocahontas foundry grades range from $7.50 to $8 at ovens.

Expect Prices to Drop

Boston, Sept. 29.—Foundry coke consumers in New England are looking for a drop in prices as a result of excess production of beehive fuel because of the steel strike. Most of the foundries however have contracts covering their requirements throughout this year, and Connellsville coke, however low it may go, is not expected to come into the New England market in quantity. A lower price on Connellsville coke throughout the present week will have the effect of bringing down the October schedule on sliding scale contracts for by-product coke. Much of the tonnage is, however, on a flat rate basis. Coke producers say that new contracts on a flat rate basis will not be lowered, and first half coke is being held at $11.90.

Demand at St. Louis is Good

St. Louis, Sept. 27.—One effect of the steel strike in this district has been to improve coke receipts from eastern ovens. For weeks consumers have complained of delayed deliveries, due to the car shortage. The suspension of blast furnaces in the East has released a large number of freight cars, which are being loaded with coke and sent to western destinations. One dealer received more coke in two days this week than in 10 days preceding. Demand is excellent, especially for foundry coke.

Heavy Demand

For Stock Tin Plate Caused by Strike —Operations Favorable

Pittsburgh, Sept. 30.—The effect of the strike on the tin plate market has been to sharply stimulate the demand for stock plate and some manufacturers report no difficulty in making sales of this grade at $7 per base box, Pittsburgh. Comparatively few plants have suffered much as a result of the strike, several of the independents having kept going owing to the fact that they were working under agreements with the Amalgamated association, whose members are not subject to the strike call. These agreemets, however, were not sufficient to enable some plants to keep in operation. The American Sheet & Tin Plate Co., having a number of its works in isolated places, did not suffer much. The Cambridge works of the American Sheet & Tin Plate Co., Cambridge, O., and the Chester works, Chester, W. Va., have been running full throughout the strike, and the interruptions at the Farrell works, at the New Castle works and the Shenango works were short-lived, all of these plants having had steady accession to working forces after the first day of the strike and today the Shenango works are running 90 per cent full.

Ford Awards Big Tonnage

Places 20,000 Tons With American Bridge Co. For Detroit Plant Extensions—Structural Lettings Keeping up in Good Tonnage

Pittsburgh, Sept. 30.—One of the largest structural contracts awarded in some time has been taken by the American Bridge Co. It involves 20,000 tons of material for a group of foundry buildings for the Ford Motor Co. at its new River Rouge plant near Detroit. There seems to be no let-up in the inquiries for fabricated material and in view of the unsettled labor situation lettings must be considered to be quite satisfactory.

Structural Lettings Undisturbed

Boston, Mass., Sept. 29.—The usual amount of structural work in New England throughout the week has continued to be let in the face of the industrial disturbance. Boston strikes, including the policemen's walkout, together with other strikes in New England have had the effect of cutting the construction down for some time, and thus the steel strike loses some of its effect. Plans for the Broadway theater and post office have been changed to permit the use of stock shapes. The new plans will require 275 tons of steel and the work has been let. The Boston & Maine bridge at Haverhill, Mass., requiring 1799 tons of steel has been awarded. The average amount of work ahead among New England fabricators is nearly one and one-half months and this has the effect of increasing competition and of lowering prices.

Sentiment Has Improved

New York, Sept. 29.—While the strike still is exerting a depressing influence upon the eastern structural market, sentiment is greatly improved. The failure of the unions to effect a serious rupture in operations in eastern Pennsylvania generally is regarded as indicative that the force of the strike throughout the industry is on the wane. With few exceptions, new structural inquiries are small relatively. Nevertheless, they represent a good tonnage in the aggregate. The largest individual job to appear involves 3300 tons for a building for the Fulton Street Refrigerating Co., New York City. Other lots in the east, for the most part, run around 200 to 350 tons. Awards are small individually. Fabricated work is ranging from $100 to $125 erected in the district.

Active in Cleveland District

Cleveland, Sept. 30.—The strike in the iron and steel industry has not affected the structural market in this district, and some fairly good tonnages have been placed. A report is current that union workmen in the fabricating shops are opposed to working up material made in the mills since Sept. 22, the date of the beginning of the steel strike, but no verification is obtainable. Fabricators believe that if any men went out on such grounds it would be a mere subterfuge as they claim there would be no way of determining the date of the manufacture of the material. A great deal of new work is developing in the Detroit district. The Ford Motor Co. placed an order for a good tonnage with the American Bridge Co., for a power plant at River Rouge, and both the Ford interests and the General Motors Co., are understood to be closing deals with the same company in connection with further development work.

Lettings More Numerous

Philadelphia, Sept. 30.—Structural conditions in this district are improving. Fabricators report a number of new orders the largest of which are 600 tons for a Rittenhouse apartment house, this city, and 800 tons for the extensions of the plant of the American Locomotive Co., at Chester, Pa. Numerous small jobs also have been let. The plain shape market reflects awaiting situation and eastern mills report that new demand is somewhat inactive. Included in recent orders are several hundred lots for England, China and other countries.

Construction is Active

Chicago, Sept. 30.—Made up entirely of moderate lots, a fairly large tonnage of structural shapes was contracted during the past week in Chicago territory. The largest tonnage is 617 tons for an engine plant at Springfield, Ill., for Montgomery Ward & Co. Other tonnages are considerably less.

CONTRACTS AWARDED

Hotel, Lima, O., 300 tons; to Bellefontaine Bridge & Steel Co.

Building for Fisher Body Co., Detroit, Mich., 125 tons; to Daigle Iron Works.

Building for Foote-Burte Co., Cleveland, 900 tons; to McClintic-Marshall Co.

Building for Goodyear Tire & Rubber Co., Akron, O., 2600 tons; to Massillon Bridge Co.

Additional construction of beater, machine and finishing rooms for Escanaba Paper Co., Escanaba, Mich., 125 tons to Worden-Allen Co.

Factory for Interstate Milk Products Co. at Sparta, Wis., 100 tons to Worden-Allen Co., Milwaukee.

Addition to malleable foundries of Chain Belt Co., Milwaukee, 500 tons to Milwaukee Structural Steel Co.

Extension to the plant of the Standard Tank Car Co., Sharon, Pa., 175 tons to the McClintic-Marshall Co.

Extension to the plant of the National Metal Molding Co., Economy, Pa., 150 tons to the Jones & Laughlin Steel Co.

Group of foundry buildings for the Ford Motor Co., River Rouge plant near Detroit, 20,000 tons to the American Bridge Co.

Shop buildings at Springfield, Ill., for Montgomery Ward & Co., 617 tons, to the Morava Construction Co.

Foundry building at Milwaukee, for Chain Belt Co., 572 tons to Milwaukee Bridge Co.

Foundation material for building for the Tribune Co., Chicago, 317 tons, to the American Bridge Co.

Alterations and additions to foundry building for the Ohio Steel Foundry Co., Lima, O., 315 tons, to the Toledo Bridge & Crane Co.

Addition to power plant for the Monsanto Chemical Works, East St. Louis, Ill., 190 tons, to American Bridge Co.

Power plant at Muskegon, Mich., for Brunswick-Balke-Collender Co., 270 tons, to Hansell-Elcock Co.

Theater building for William Hamm, St. Paul, 300 tons, to the American Bridge Co.

Two 180-foot riveted spans at Hoquiam, Wash., 130 tons, to independent shop.

New factory and power plant for Edmonds Shoe Co., Milwaukee, 300 tons to Worden-Allen Co.

Addition to pipe storage for Steel & Tube Co. of America, Mark works, Indiana Harbor, 150 tons to Worden-Allen Co.

New hotel for Chippewa Falls (Wis.) Hotel Co., 250 tons to Worden-Allen Co.

Laboratory for Newport Chemical Co., Carrollville, Wis., 200 tons to Worden-Allen Co.

Theater building, Richmond, Va., 235 tons, to independent shop.

Building for Brown Cork & Seal Co., Baltimore, 200 tons, to independent shop.

Addition to Bridgeport Brass Co., Bridgeport, Conn., to Levering & Garrigues.

Bridge for Merril Coal Mines Co., Henlawson, W. Va., 350 tons, to the American Bridge Co.

Extension of the plant of the American Can Co., Portland, Me., 170 tons, to New England Structural Co.

Bridge for Boston & Maine railroad at Haverhill, Mass., 1799 tons, to Bethlehem Steel Co.

Rittenhouse apartment house, Philadelphia, 600 tons to the Phoenix Bridge Co.

Addition to new armory, Philadelphia, 100 tons to the Phoenix Bridge Co.

Paper mill, York Haven, Pa., 100 tons to Phoenix Bridge Co.

Machine shop and foundry for the American Locomotive Co., Chester, Pa., 800 tons to Belmont Iron Works.

Machine shop for Newton Machine Tool Co., Philadelphia, 200 tons to the Belmont Iron Works.

Addition to the plant of the National Sponge Silk Co., New Bedford, Mass., requirements increased to 300 tons and contract placed.

Extension to the plant of the International Motor Co., Allentown, Pa., 1100 tons, reported to have gone to the Phoenix Bridge Co.

CONTRACTS PENDING

Mercantile building, Baltimore, 250 tons, bids being asked.

Addition to Rhode Island hospital, Providence, 200 tons, bids being asked.

Addition to plant of Aluminum Co. of America, Edgewater, N. J., 200 tons, pending.

Building for Oxford Paper Co., Rumford, Me., 200 tons, bids pending.

Dupont office building, Wilmington, Del., 1200 tons, bids pending.

Building for Troy Blanket Mills, Troy, N. H., 350 tons, bids being asked.

Building for Fulton Street Refrigerating Co., New York City, 3300 tons, bids being asked.

Building for West Virginia Metal Co., Fairmont, W. Va., 1000 tons, bids pending.

Power plant for state of New York, Marcy, N. Y., 350 tons, bids pending.

Additions to plant of A. O. Smith Corp., Milwaukee, 1500 to 2000 tons. Plans being prepared.

Plant for Omaha Cold Storage Co., Omaha, Nebr., 400 tons, bids asked.

Scottish Rite Temple, Bloomington, Ill., 300 tons, bids asked.

Bascule bridge, Main street, Kenosha, Wis., 600 tons, bids in.

Motion picture theater for Lubliner & Trintz, Chicago, 600 tons, bids asked.

Good Output

Continues in Sheets Except in Valley —Buyers Back Mills

Pittsburgh, Sept. 30.—Operations of the sheet mills, at no time as seriously hampered as some other kinds of fin-

ishing mills since the inception of the strike, are on a higher scale today than they were a week ago. At least a dozen of the independent plants are operating full while all of the isolated sheet mills of the American Sheet & Tin Plate Co. are running 100 per cent and marked improvement is noted at several of the plants which were crippled by the walk-out of Sept. 22. The Dover works, Canal Dover, O., the Guernsey works, Cambridge, O., the New Philadelphia works, New Philadelphia, O., the old Meadows works and Scottdale works, Scottdale, Pa., and the Wellsville works at Wellsville, O., all are running 100 per cent, while the return of the men at the Vandergrift plant, Vandergrift, Pa., and at the Mercer works, Farrell, Pa., has been sufficient to bring operations of these plants well up. Illustrative of the exaggerated estimates of a number of men out at some of the American Sheet & Tin Plate plants, it can be stated that while the organizers estimate the number of men on strike at Vandergrift at 4000, the maximum number of men ever employed there was 3000, and the organizers also claim to have 2000 men out at Leechburg where the maximum number employed has never been over 600.

Valley Production Stops

Youngstown, O., Sept. 20.—Every mill in this territory is idle. Some sheetmakers clamped on the lid last Monday as regards new business. District sales managers have been notified to defer taking orders until further notice. Certain sheetmakers here are accepting firm business only, the shipping date depending on the settlement of present conditions. Jobbers and dealers report considerable spot business in hand.

Eastern Mills Are Dull

Philadelphia, Sept. 30.—Sheet situation is strong in the East and particularly so since the strike has cut down shipments from the West. The leading eastern maker of blue annealed is sold up on practically all sizes for remainder of the year. A small Delaware maker is selling black and galvanized sheets at premiums.

Pipe Shortage

Seems Probable as Various Plants Are Idle—Cast Prices Higher

Pittsburgh, Sept. 30.—A serious shortage of tubular goods is probable over the remainder of the year in view of the fact that most of the independent companies in this and the valley districts are down as a result of the strike. Spang-Chalfant & Co., Pittsburgh, have been obliged to suspend temporarily because a strike of a few of its men made operation impossible, while the pipe mills of the Wheeling Steel & Iron Co., and La Belle Iron Works, are idle, and the Youngstown Sheet & Tube Co. and the Republic Iron & Steel Co., at Youngstown, have not yet resumed. The National Tube Co. meanwhile continues to keep most of its plants going practically full.

Scrap Market Drifting

Complete Absence of Buying by Mills Produces Lifeless Situation—Deliveries Held Up—Rerolling Material in Demand

FOR COMPLETE SCRAP PRICES SEE PAGE 950

Chicago, Sept. 30.—Although cessation of operation to considerable extent by steel mills has stopped shipments of those grades of scrap used in the open hearth furnace, it has stimulated to some extent demand for rolling mill grades and for rerolling rails, as plants producing bar iron and hard steel bars have not been affected. On the contrary, extra demand for these products has increased the operations of these mills and scrap is in demand. Foundries are also taking all the cast scrap it is possible to obtain because of interference with pig iron deliveries by the strike. Railroads are offering only fair tonnages, the Rock Island taking figures on 2250 tons, the Chicago, Milwaukee & St. Paul on 1000 tons and the Monon on 387 tons.

Boston Market Quiet

Boston, Sept. 27.—The market for scrap used by steelmakers is quiet. Dealers are not purchasing heavy melting, even at the low prices offered. Some scrap is still moving to blast furnaces on orders previously placed, but some orders have been canceled. Demand for No. 1 machinery is strong, although the price has dropped from the high point of a week ago. A Massachusetts foundry bought 200 tons at $29, delivered, and dealers are paying as high as $26, Boston yards.

Market Tone Firmer

New York, Sept. 29.—With early reports indicating failure of the strike at Bethlehem, Pa., the tone of the local scrap market is becoming firmer. Trading, however, remains of rather small proportions. Borings and turnings and cast scrap, although moving slowly, appear to be in best demand, and prices are slightly higher. Mixed borings and turnings are now being quoted at $10.50 to $11, f.o.b. New York, and clean cast borings at $12 to $12.50. No. 1 heavy cast and No. 1 machinery cast are also higher, holding at $21.50 to $22 and $22.50 to $23, respectively.

Foundry Scrap in Better Demand

Philadelphia, Sept. 30.—Demand for all grades of scrap is improving right along. A slight demand for railroad wrought has been coming from various rolling mills lately. Borings are also being called for. In heavy melting and allied grades little business is before dealers. Due to the strike situation the mills are postponing buying and dealers, in view of the lack of assurance that shipments can be made, are not anxious to have the stock leave their yards.

Prices Merely Nominal

Pittsburgh, Sept. 30.—Conditions in the scrap market here are much as they were a week ago, with steel manufacturers generally asking suspensions of shipments against contracts and doing no buying. Meanwhile shippers are not pressing material for sale, realizing the futility of trying to do business under present conditions. Foundry grades of scrap also are moving slowly although the effect of the strike on the foundries generally has been slight. Prices are nominal in the lack of important transactions. The Pennsylvania railroad October list of scrap involves offerings of 17,722 gross tons.

No Buying at Buffalo

Buffalo, Sept. 30.—With no mills in the market for scrap in this territory, conditions in this trade are very quiet. Only a few mills are operating and these apparently have sufficient stocks to take them along for a while without doing any purchasing. Scrap traders are not active and are resigned to the awaiting of the return of the steel trade to normal. Prices continue firm.

Trading Completely Absent

Cleveland, Sept. 30.—Scrap iron and steel is on the dead-center here. There is no trading even among dealers. Mills, of course, have completely cut off shipments because of the strike. Dealers' yards are crammed full, and while some bargains could be picked up at the plants of producers anxious to sell scrap to get the space, they are finding no outlet. Dealers claim not in years to have experienced such a dullness as prevailed in the past week. The market sentimentally is much weaker, but prices remain unchanged because of the total absence of trading.

Only Foundry is Active

Cincinnati, Sept. 30.—With the exception of a little activity in foundry scrap the market is lifeless. Shipments to the Pittsburgh district are being suspended, although it is predicted that the situation may clear up in a few days when a resumption of deliveries to consumers in that territory will be resumed. Heavy melting steel is very weak. Foundry cupola-size scrap is holding its own.

Consumers Holding Off

St. Louis, Sept. 27.—Trading in the scrap market is virtually at a standstill. The trend of prices on nearly all grades is sharply lower and the feeling is bearish, especially among small dealers and yard interests. The sharpest cuts have been made in miscellaneous railroad and country scrap. There is no buying by consumers, except in small lots for immediate use, and speculative activity has stopped. Mills and foundries in this district have not been affected directly by the strike, but uncertainty in the entire industry has influenced buyers, and they are disposed to await developments. Offerings from all sources are limited.

Buyers Aiding Bar Mills

Refrain From Bringing Pressure For Deliveries—Much Tonnage Being Offered Operating Plants—Bar Iron Improves

Chicago, Sept. 30.—Consumers of steel bars are standing behind the strike-bound mills and seem to realize that the present battle is being fought for the good of industry in general, expressing a willingness to undergo whatever inconvenience may result from lack of material in order to assist in settling the dispute correctly and once for all. Much voluntary encouragement is being expressed to the producers and no pressure is being brought to bear on the mills to bring about greater production by a surrender to labor demands. Most producers are refusing to book new business and are accepting specifications on existing contracts subject to such delay as may result from the present strike.

Demand for bar iron is greatly increased by the difficulties of obtaining soft steel bars, and mills producing this material have jumped at once into a position of heavy business after having been unusually slack for several months. Demand is coming from all sorts of users and the mill situation is decidedly in contrast to that of preceding weeks. In spite of the heavy demand, prices remain unchanged at 2.62c, Chicago mill.

Much the same condition is found in demand for hard steel bars. Many consumers are seeking to obtain tonnages of this material to replace soft steel bars held up by the strike. Consumers with contracts already on mill books are specifying freely and sufficient business for the remainder of the year is now in hand. With a scarcity of rerolling rails, the situation is decidedly strong from the viewpoint of producers. The quotation continues firm at 2.55c, Chicago mill.

Take Orders at Premiums

Philadelphia, Sept. 30.—Very few western makers in taking steel bar orders, except as specifications on contracts. One Pittsburgh interest is taking occasional small bar orders to be rolled on high cost mills at 2.50c to 3.00c Pittsburgh. An eastern Pennsylvania maker is taking some bar orders but mostly to be made of special steel at base price of 2.50c Pittsburgh. Some reinforcing bars are being placed but not in large volume.

Active Mills Are Deluged

Cleveland, Sept. 30.—Those makers of bars and other finished products who are generally known to be operating at a favorable rate are being deluged with specifications and requests for new tonnage. The Cleveland offices of some of these companies report the inquiry received the past week to have been the heaviest in their history. Because of the extensive demand, only a small portion of the offered tonnage is being accepted. This was the case of an attractive lot of 5000 tons of bars. Leading Pittsburgh mills are taking some new business subject to indefinite delivery. On a round lot of bars, Chicago mills offered to deliver partly in October and November.

Taking no New Orders

Pittsburgh, Sept. 30.—Makers of merchant steel bars here whose plants are down naturally are refusing to honor new inquiries or specifications and those whose works still are in operation are pursuing a like course in the matter of new orders as their contract obligations, especially in the smaller sizes will probably absorb all production this year. Manufacturers who have not suffered from the strike are flooded with inquiries from buyers whose regular sources temporarily are cut off and if the tonnage was available no doubt could get substantial premiums.

Little Interruption to Operations

Pittsburgh, Sept. 30.—Aside from some interruption in the supply of bars and rods, makers of nuts, bolts and rivets generally are unaffected by the steel strike and shipments are going forward in practically normal fashion with prices showing no change.

Business Does Not Suffer Much

Pittsburgh, Sept. 30.—The principal producers in this district of cold finished steel bars and shafting note practically no interruption to business as a result of the strike and while some of them are not getting full supplies of merchant steel bars, the fact that they all had fair sized stocks on hand before the labor disturbance again enabled them to keep up plant operations to the recent rate. While demands are coming from fairly widely scattered sources, the best call comes from the makers of automobiles and tractors. Prices are unchanged at 3.60c, base Pittsburgh, and deliveries fairly good.

Have Reserve Stocks

Pittsburgh, Sept. 30.—While the plants of some makers here of hoops, bands and cotton ties are down as a result of the strike, enough capacity is active to meet current specifications. Deliveries also are helped by the fact that most makers have fair sized reserve stocks of hoops and cotton ties.

Plates Firm Up to 2.65c

Shading Disappears as Production is Restricted—Eastern Mills Book Increased Tonnage and Run Better

Philadelphia, Sept. 30.—Eastern platemakers say the closing down of western mills is causing them to receive much business which otherwise would not come their way. Brisk buying is reported in all directions and numerous tonnages have been booked from 1000 to 3000 tons for bridge work, tanks and particularly for oil well boilers. One mill has given an option on 30,000 tons for 10 vessels. The Emergency Fleet corporation has specified for moderate tonnages during the week. The Lukens Steel Co. will put its 204-inch mill in operation tomorrow making all its mills active. This company reports business greatly improved and only the fact that all strikers are not back has prevented it from running 100 per cent in the past week. The market is stronger and shading is less frequent.

Price Stiffens Sharply

Pittsburgh, Sept. 30.—The effect of the strike in plates has been to bring about a demand upon the manufacturers whose mills are active, from consumers whose sources of supply are shut off and a considerable amount of business has been placed in this district in the past few days at the full March 21 base of 2.65c. Among the sales was one involving close to 2500 tons. Just before the outbreak of the strike the market was pretty generally quoted at 2.50c, Pittsburgh, for minimum lots of 1000 tons and it was said that that price also was being accepted on smaller tonnages. The demand continues almost entirely from the tankmakers, although some foreign inquiries for ship plates also are noted.

Small Orders

For Railroad Cars More Numerous—Export Lots Are Placed

Chicago, Sept. 30.—Occasional inquiries for railroad cars are being received, all being for small lots and some offering much business for builders. The former inquiry by Mitsui & Co., exporters to Japan, for 250 sets of freight car trucks, has been revived and increased to 500 sets. This will require about 10,500 tons of plates, shapes and bars and about 2000 axles, which will involve 500 tons additional of steel. The Cuban railway is inquiring for six sleeping cars, and the Atlantic Coast line for four diners. The latter is also in the market for 100 phosphate cars, the inquiry for which was made some months ago and allowed to lapse. The American Car & Foundry Co. has taken an order for 25 mine cars for the Forks Coal Co., Portage, Pa., 200 mine cars for the Pennsylvania Coal Co. of New York, and 300 tank cars for the Crown Oil & Refining Co. The Standard Steel Car Co. has taken an order for 200 flat cars for the Cuban Central railroad, and the Pressed Steel Car Co. for 200 box cars for the same company.

Export Record is Broken

September Banner Month of Year for Sales — Strike Checks Delivery of Seasonable Goods—Agents Holding Up New Inquiries

NEW YORK, Sept. 29.—Strike conditions have begun to show an effect in the export trade. The volume of inquiries is adequate to give to the American industry all the foreign business desired, but the problem of delivery is causing so much anxiety that agencies are hesitating about making quotations. All export inquiries were held up during the first part of last week in the hope that a better report from the mills would warrant the opening of negotiations. As the strike continues, however, the agents are beginning to advise their foreign customers that this is not the time to enter into new contracts. All of the agents are attempting to supply essentials to foreign customers. So far the question of price has not entered into the matter.

Despite the strike, however, the foreign sales made during September promise to exceed greatly the sales made during August and will create a new record for the year. If strike conditions continue to improve, there promises to be a rush of export business to the mills. The inquiries now in hand are adequate enough to give the mills more business than they could turn out. The labor trouble in the United States, so far as foreign trade is concerned, comes at a most opportune time, as England's rail traffic is tied up and British producers are finding it extremely difficult to fill their commitments.

German salesmen have made their appearance in South America. So far as could be learned the Germans are not as yet offering to sell iron and steel products, but the methods they are using to obtain orders for other products are such as will have a bearing on the situation in the future. It is said that the Germans are offering to sell upon a basis of delivery as soon as possible at a price subject to adjustment with discounts. The terms offered by the Germans would be at a price approximating 20 per cent below the market at the time of actual delivery.

The Consolidated Steel Corp. continues its effort to arrange with its constituent mills to increase its proportion of output for export. The Consolidated mills set aside 10 per cent of their output for foreign sales. In some products agreements are being signed to allocate as much as 20 per cent of the output for export. The increases are being made in sheets, bars and tin plate. This applies only to the 1920 business.

Actual sales made during the past week contain nothing of outstanding importance, although a number of contracts were mentioned by export houses as indicative of the nature of the business. Denmark, for instance, has purchased 1500 tons of rods, and a new inquiry for 1000 tons of rods has been received from Norway. England is inquiring for bars and sheets and a number of sales have recently been made.

Little business is done with France and inquiries are for small tonnages. One of the recent sales noted was 200 tons of plow shapes. An inquiry was received for five tons of billets. Belgium has inquired for 10,000 tons of pig iron, but it is believed that American makers will not be able to meet the price which either the French or the English furnaces will be able to quote.

Italy has purchased some machinery and a few hundred tons of pig iron. Greece is buying bars and wire. Holland has been buying actively of ship material in lots varying from 500 to 1000 tons. The Dutch have also been purchasing nails, but it is understood that these goods are intended for their East Indian colonies. Australia is purchasing wire, sheets and bars.

The Orient continues to be a good market for American iron and steel. One house reported the sale of 3000 tons of light rails to Japan.

American agents are trying to hold trade in South America. This and the Oriental markets are considered permanent acquisitions for our industry and an effort is being made to keep these customers supplied even during the strike in this country. Recent sales to South America represent an accumulation of inquiries. A large tonnage of sheets have been sold there in quantities varying from 30 to 300 tons.

Foreigners have been asking for large tonnage of American coal and coke but it has been impossible to ship. The steamship lines prefer to engage their tonnage in carrying commodities which pay higher rates and in response to foreign appeals the shipping board has refused to divert government vessels to this trade because, it is argued, the foreign nationals should so engage their own ships.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead, New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot
Sept. 24	23.50	53.00	6.25	7.00	33.00	8.50	41.00
Sept. 25	23.50	53.50	6.25	7.00	33.00	8.50	41.00
Sept. 26	23.50	53.50	6.25	7.00	33.00	8.50	41.00
Sept. 29	23.50	53.00	6.25	7.00	33.00	8.50	41.00
Sept. 30	23.50	53.00	6.25	7.00	33.00	8.50	41.00

* September shipment from Singapore, f.o.b. New York.
† American Smelting & Refining Co.'s price.
‡ Producer's price. Outside market, Sept. 24, 25, 26, 29 and 30, 21.75c; lake, 22.00c to 22.25c; casting, 21.00c to 21.25c.

NEW YORK, Sept. 30.—The steel strike, the English railroad strike and the violent fluctuations in the foreign exchange markets have been the dominating factors in the nonferrous metal markets, making for great uncertainty among both buyers and sellers, with consequent little business. Prices held their own but did not advance during the week.

The English railroad strike did not begin until Sept. 28 and so the trade has not yet had much opportunity to judge its effects on our markets, excepting the general effect on the tin situation. With British shipping tied up, shipments of tin will cease for the time, which, if prolonged, may affect spot tin here. The British tin market dropped over £5 the first business day after the strike was called, but reacted today. The Sterling exchange market, after a good gain based on reported arrangements whereby Great Britain will not be compelled to pay its interest annually, dropped sharply in conjunction with the strike.

Copper has showed little change, large producers maintaining their quotation of 23.50c for early shipment. Outside sellers early in the steel strike dropped their prices to 21.50c, but later were more confident, substantial sales being made last week at 21.75c, at which level the market has stood for several days. The market for casting copper has stood at about 21.00c and lake at 22.00c to 22.25c.

The steel strike has caused consumers of tin to hold back from purchasing this metal, but prices have held fairly well. The market has been strong at Singapore, while the rise in exchange added to the cost of importing tin. Quotations on Straits tin this week have averaged around 53.00c for September and October shipment from Singapore; 52.75c for November and December shipment. Spot Straits tin is quoted about 55.25c to 55.50c; spot electrolytic tin 54.75c to 55.00c; spot 99 per cent tin, 54.25c.

Several hundred tons of lead recently sold for September shipment at 6.27½c, New York; a later sale consisted of 500 tons for November shipment at 6.25c, New York.

Strikers Steadily Losing Ground

Increasing Number of Men Returning to Mills, While Leaders Fail in Attempts to Close Plants of Bethlehem Steel Co., and Jones & Laughlin Steel Co.,— Judge Gary Testifies Before Senate Committee

THE second week of the strike in the iron and steel industry shows definite improvement in the situation from the standpoint of the employers. In some districts the mill operations have been increased appreciably, with the Pittsburgh district standing forth most prominently in this respect, but the most significant feature of importance to the industry as a whole is a tendency on the part of many men in all districts to return to their jobs. With some important works the number of men on duty increased 20 to 25 per cent in the week. Organizers for the unions are finding it increasingly difficult to hold their men in line, and as time goes on the indications are they will find it impossible, as the majority of the employes are in favor of working. A deadlock may exist for a time, but employers express confidence that eventually the sane judgment of the men must assert itself.

In the Chicago district a sufficient number of men have returned to permit a slight increase in operations. In the southern, eastern and Massachusetts districts strike leaders have failed utterly in their attempts to create dissension. In the Cleveland district men have returned to work in one plant and partial operations resumed, otherwise production in that territory is completely suspended. In the Youngstown district hundreds have asked their employers to resume operations, and the number is now believed sufficient to warrant resumption, although this has not actually been undertaken. The district has been calm because the strikers have been allowed to have their own way, and it is feared that an attempt at operation may cause disturbances. In the Pittsburgh district the mills are making steady progress toward a return to normal.

Repeated attempts to interrupt the operations at the plants of the Jones & Laughlin Steel Co. have failed, while the supreme effort of the unions to close the plants of the Bethlehem Steel Co. resulted in a fizzle. In every district the tactical advantage appears with the employers.

Interest centers in the testimony of E. H. Gary, chairman of the United States Steel Corp., who appeared before the senate investigation committee, Wednesday. Having failed to score a point before the senate committee, strike leaders are now hoping to make their fight the dominant issue before the industrial conference in Washington, Oct. 6.

The Allegheny county court has upheld the mayor of Duquesne, Pa., in fining William Z. Foster and an organizer $100 each for violating the mayor's order against speaking in public. The court held that Foster and his workers have no right to make incendiary speeches.

Strike Fails in Pittsburgh District

PITTSBURGH, Sept. 30.—Just as the Belgian army five years ago held the German invading army in check long enough for the allied countries to gather their forces, so the Pittsburgh steel manufacturers have stemmed the tide of the discontented workmen in their plants and have spared not only the steel industry but all other industries from a condition where the hiring of workmen would be possible only through the offices of the labor union.

As far as the Pittsburgh district is concerned the strike has been a failure and while labor organizers are not yet ready to admit this, they can point to only a few plants either of the United States Steel Corp. or the independents, that are down as a result of the strike, while a number of them which suspended or curtailed during the first day or two of the trouble, have had sufficient men return to permit a resumption. Intimidation of workmen has been freely practiced by strikers, and this is preventing full operations.

The strikers shot their bolt on the first few days of the strike and the past four or five days have seen a steady decline in their fortunes. They have not been able to maintain their gains either at the plants of the Carnegie Steel Co., or at those in the lower Monongahela valley. Although the Pittsburgh works of the Jones & Laughlin Steel Co. were to have been shut down, according to the labor leaders, these works are running practically full, with only a slight defection even among foreign laborers. Failure to cripple either the corporation or the largest independent in the Pittsburgh district has been a body blow to the agitators.

The strike has taken several peculiar twists. While aimed directly at the Steel corporation it has affected the independents throughout the country to a greater extent. One of the important features of the situation is the fact that steel companies which have been operating under agreement with the Amalgamated Association of Iron, Steel and Tin Workers have been affected as much as those who had not signed the scale, despite the claims of the national officers that the charters of the delinquent lodges are being revoked and contracts will be faithfully carried out. The situation applies to the cases of the Lake Erie Nut & Iron Co., Cleveland; the A. M. Byers Co., Girard, O., the Trumbull

Steel Co., Warren, the Deforest plant of the Republic Iron & Steel Co., Niles, O., and others. The question is asked: Of what value is a contract with the Amalgamated association when it cannot keep its men at work under present conditions?

The Carnegie Steel Co. issued the following statement today:

"We are making steel and lots of it and that tells the story. We have lost no ground, but on the contrary we still are gaining."

The plant of the Weirton Steel Co., at Weirton, W. Va., has been shut down. The plant was the only one in the Steubenville district which continued in operation last week. Strikers planned to march across the Steubenville bridge in a body, but Governor Cornwell, of West Virginia, wired Governor Cox, of Ohio, stating that this would be considered an invasion of the state. Governor Cox ordered sheriffs to prevent the strikers from carrying out their threat, and in the meantime the plant was closed.

An indication of how steel manufacturers regard the strike is the placing of an order for 30 rolls by one of the Steel corporation's subsidiaries. This order, which has been held up for the past week or 10 days, it is said, would not have been placed now if there was any doubt about the outcome of the strike.

BUFFALO

Situation is Improving; More Men Return

Buffalo, Sept. 30.—The strike situation in the Buffalo district has taken a turn for the better. Between 500 and 600 men returned to work Monday at the plant of the Lackawanna Steel Co., Lackawanna, N. Y., and 100 more came back Tuesday. They went to work through lines of pickets who failed to dissuade them. Neither the furnaces nor mills have been put in operation, but officials expect increasing numbers will report at each new shift.

"We are ready to take the men back as soon as they want to return," said George F. Downs, vice president.

No attempts were made to operate the plants of the Donner Steel Co. or Rogers, Brown Iron Co. It was announced by the latter that work will be suspended until a full working force is available.

Attempts to force a strike of men employed at the Buffalo Union furnaces, the Wickwire Steel Co., and the Tonawanda furnaces of the Donner Steel Co. apparently have failed, for these plants, as well as all finished material mills, are working smoothly. The return of workers at the Lackawanna plant now brings the number of men still out in this district down to a figure slightly less than 10,000.

Bars the Agitators

BUSINESS men and citizens of West Middlesex, Pa., have been taking a vigorous interest in the present strike. "Strike agitators keep out" in effect has been adopted as the town slogan. A few nights ago a truckload of organizers and strikers from Sharon attempted to enter the town. The progress of the truck was blocked by a roped barrier stretched across the main street and upon being surrounded by a determined committee of the citizens, the occupants were forced to turn about and retrace their course, despite their loud protestations. Volunteers from among the townspeople nightly have been patrolling the two blast furnace plants of the vicinity. A delegation of the citizens early last week called upon the officials of the United Iron & Steel Co. and offered to "pitch in" and perform manual labor at the plant if the workmen struck. They presented a similar offer from the farmers of surrounding country. "We won't let foreigners close this plant," they said.

This is the reason why both the Fannie and the Ella furnaces at West Middlesex are in operation.

PHILADELPHIA

Bethlehem Busy Despite Attempt at Strike

Philadelphia, Sept. 30.—Sentiment in regard to the strike situation has improved greatly among eastern steelmakers due to recent developments, of which the most important was the failure of the Bethlehem Steel Co.'s employes to strike. The situation has not changed in any way, since the strikers number only a few hundred and include mostly machinists. It is considered assured that no more Bethlehem employes will go out at Coatesville. The mills in this district are operating practically the same as last week. Out of 1700 who obeyed the strike call only 900 are still out. The mills are being operated as full as orders will permit. At the plant of the Milton Iron Co., Milton, Pa., 200 men who struck a week ago returned to work in the east end puddling mills Monday.

The Bethlehem Steel Co. today issued the following statement:

"It was ascertained that reports had been received at the offices of the Bethlehem Steel Co., from their plants located at Sparrows Point, Steelton, Lebanon, Reading and Bethlehem. All of them substantially reported full operations. Exceptions to this were only in unimportant, isolated units, in no way affecting the larger and important operations. There is nothing to indicate that there will be any curtailment in production."

BOSTON

Steel Works Operating at Full Capacity

Boston, Sept. 29.—All steel works at Worcester, New Haven and Bridgeport are operating at capacity and report normal labor conditions. The Fore River and Squantum plants of the Bethlehem Steel Co. are operating at full capacity and report no intimation of labor trouble. The embargo on shipment of freight to steel mill centers which has just been announced will affect many New England plants. Practically all of the pig iron producers in the Buffalo district have notified the trade that deliveries will be held up indefinitely, and therefore they can enter no more orders at present.

Foundries in New England do not believe that steel strike will affect their supply of pig iron.

CLEVELAND

Situation is Unchanged; Ore Moving Slowly

Cleveland, Sept. 30.—Iron and steel production in the Cleveland district has been practically at a standstill since the third day of the strike and although the ranks of the strikers show evidence of weakening, active production is not expected to be resumed until the situation has cleared. Employers have made no effort to run their plants, but have let it be known they are ready to resume as soon as the men report. At present only one of the 20 plants in the district is working, and that is working at one-third of its capacity. Operation of blast furnaces came to an end last Wednesday when the fires at the two plants of the Otis Steel Co. were banked. The plant of the Empire Rolling Mill Co. also closed during the week, as well as the mill de-

partments of the Otis Steel Co. which had been kept going.

Officials of the American Steel & Wire Co. announced on Monday that they were operating the H-P nail works on a limited basis. They stated that about one-third of the men who walked out reported for work when the plant opened Monday, and on Tuesday 238 men out of a total of 635 employes had reported. All were re-employed.

Men employed in a metalworking plant in Cleveland refused to work up steel which was produced since Sept. 22, when the strike was called. The shipment of the steel was accordingly suspended by the mill on request.

Shipments of ore have not been interfered with seriously, although the officials of the lake seamen's union have given out several statements that the men have voted to strike. A number of vessels have been laid up because of the lack of storage space for ore, and the Pittsburgh Steamship Co. is reported to have laid up its smaller barges. Twenty laborers on the storage dock at Randall failed to show up for work on Monday after a celebration. Loading coal on three docks was suspended by a strike of coal dock workers. Officials of the International Longshoremen's association claimed that all coal and ore handlers at Cleveland will be on strike within a few days.

At Buffalo, union officials announced that the strike of lake seamen is deferred until the cooks vote. The firemen, coal passers, water tenders and seamen have voted.

Despite strenuous efforts of agitators to organize the National Tube Co., Lorain, O., the plant is working at approximately normal capacity. Out of a total of more than 10,000 iron and steel employes, less than 200 men are on strike. At a recent meeting of the local switchmen's union, the men employed in transporting materials to and from the plant, voted by an overwhelming majority not to strike.

DULUTH

No Headway is Made by Strike Organizers

Duluth, Sept. 30.—Little headway, if any, has been made by organizers for the steel workers in this district. Since the calling of the strike Sept. 22, operations at the local plants of the Minnesota Steel Co. have continued on a normal basis. No men on the iron ore ranges have gone on strike, and little strike talk is heard in the entire district. The only defection reported is at the Zenith mine near Ely, Minn., where a number of foreign workmen walked out.

BIRMINGHAM

Strike in South Proves Complete Failure

Birmingham, Ala., Sept. 30.—With no one in authority in this district to call it off, the "strike" of the iron and steel workers continues, with all plants of the Tennessee Coal, Iron & Railroad Co. and American Steel & Wire Co. in operation. Production is normal. Many of the foreign-born laborers applying for reinstatement are being refused work because of their inefficiency. Operations of all mills start on time, and the workmen remaining loyal have been given to understand that there is plenty of work ahead for many months. The Birmingham Southern railroad suffered the loss of a few machinists, but the night crew at the steel mills cared for the engines, and the service was not interrupted. The strike in the Birmingham district throughout was a dismal failure. Less than 250 men are out.

CHICAGO

Gary and South Chicago Mills Operate

Chicago, Sept. 30.—Little change is shown in the strike situation, despite expectations that a large number of men would return to work or that part of those who have been working would join the strikers. The plant of the Inland Steel Co., continues entirely idle, except that fires are being kept up in two banked blast furnaces.

At the Gary plant of the Illinois Steel Co. four blast furnaces are active. Two units of the open hearth, comprising 28 furnaces, are producing steel. The duplex plant, the slab mill, plate mill and two merchant mills are in service, and the rail mill is working part time. At the South Chicago plant four blast furnaces are active. The slab mill and universal plate mill also are turning out their products.

At Gary, 280 coke ovens of the 700 in the plant are producing coke. At Joliet one unit of 70 coke ovens is active and the blast furnace stacks are banked, while mills are idle.

Among the smaller concerns affected by the strike no change has occurred. The situation continues quiet, with occasional sporadic cases of violence of no particular significance. No effort is being made to use strike-breakers and men at work in the mills are employes on the payrolls before the strike.

Striking steel workers at the Bay View plant of the Illinois Steel Co., Milwaukee, commenced returning to their jobs last Friday. R. B. Charlton, general manager of the plant, stated Sunday that many employes have already returned to work, giving promise that operations may be resumed during the present week. The plant normally employs between 1350 and 1500. One of two blast furnaces at the Bay View plant was in operation when the strike was called.

YOUNGSTOWN

All Mills Idle; No Attempt to Operate

Youngstown, O., Sept. 30.—Every iron and steel plant in the Mahoning valley of importance is tied up completely. All blast furnaces are banked and not a wheel is turning in any of the rolling mills. The Trumbull Steel Co., Warren, O., operated for 36 hours during the first part of last week but closed down every department of its works until further notice. The electricians employed by the Trumbull company and affiliated with the electrical workers' union made demands for 90 cents per hour and changes in working conditions.

In various parts of the valley reports are current that a large number of members of the Amalgamated Association of Iron, Steel & Tin Workers would return to work immediately if enough laborers and cranemen were obtainable to operate the sheet rolling departments. On several ocasions last week, committees of this association tried to induce mill owners to start up their plants.

Indications are that the officials of the Carnegie Steel Co. will try to operate the Ohio works probably this week. Monday morning several small groups of mechanics, carpenters and machinists entered the plant.

Practically all of the 60 hot mills of the plants of the American Sheet & Tinplate Co., at Newcastle, Pa., began work Monday. The plant of the Carnegie Steel Co., at Newcastle, improved its schedule.

A large number of men returned to work at the plants of the United States Steel Corp., at Sharon and Farrell, Pa., according to officials. The

plant of the American Sheet & Tinplate Co., at Sharon was scheduled to begin operations Tuesday. Two blast furnaces of the South works at Farrell are now in operation. The blooming and bar mills of this plant are declared to have practically full complements of men. Many men have returned to work at the Sharon plant of the Sharon Steel Hoop Co. The plant of the Valley Mould & Iron Co., Sharpsville, Pa., have resumed.

Ore, coke and coal movements in the Youngstown district are entirely suspended. It is estimated that 1344 cars of ore and 776 cars of coal have accumulated in this territory since an embargo was declared and the cars are subject to a demurrage charge of $2 for the first four days and $5 for every day thereafter. The regional directors will meet in Chicago this week and decide how the demurrage charges will be assessed.

Pickets are Enjoined by Judge Landis

Chicago, Sept. 29.—Judge Kenesaw M. Landis, in federal court, has issued an injunction forbidding strikers to picket the plant of the Pollak Steel Co., in South Chicago. The injunction forbids any picketing, intimidation or threats or any effort to prevent in any way the employes of the company returning to work or interfering with their right to work if they choose. A hearing on the injunction was to have been held Sept. 30. The company claims 99 per cent of its men desire to work, but are kept away by intimidation.

Steel Wages Far Above "Pauper Line"

Pittsburgh, Sept. 29.—In refutation of the testimony given before the Kenyon investigating committee in Washington last Thursday by John Fitzpatrick, chairman of the national committee for organizing iron and steel workers, that wages for steel plant laborers were below the "pauper line," a table of wages has been prepared, based on the reports of several companies, which not only shows wages for the workmen to be well above that line, but to be greatly in excess of those paid common labor in other industries.

Common labor commands from 45 to 50 cents an hour, the standard workday being eight hours and carrying time and a half for overtime. Thus the workman, who puts in 10 hours is paid for 11 hours and for a 10-hour day received from $4.95 to $5.50. Semiskilled laborers earn from $8.20 to $9 a day, these wages being earned principally in wire and tube mills, where a few weeks' training makes a workman semiskilled. Average daily wages of skilled labor run as follows:

Sheet rollers	$28.16
Sheet heaters	21.12
Roughers	11.92
Catchers	11.92
Steel pourers	12.84
Vessel men	14.65
Engineers, manipulators, etc.	12.63
Blooming mill heaters	17.92
Skelp mill heaters	18.18
Skelp mill rollers	21.73
Lapwelders	16.08
Bowers	13.76
Bottom makers	12.91
Regulators	13.52

Employe Speaks Out For American Workmen

Chicago, Sept. 27.—A. K. Perkins, an employe of the Inland Steel Co., at Indiana Harbor, Ind., has sent a telegram to Senator Kenyon, chairman of the senate committee on education and labor, in which he speaks for employes of the Inland Steel Co., in contradiction of the testimony of John Fitzpatrick.

The assertion is made that 90 per cent of Inland employes desire to return to work and that the company desires to operate; that the men had nothing to strike for, as an 8-hour day has been in effect, a profit-sharing system is being put into effect and a collective bargaining plan has just been started.

He states the lowest wage paid common labor is 50 cents per hour and that Inland employes are paid higher wages than the Amalgamated scale. Continuing:

"This strike was called against the Inland Steel Co.'s plant without any demands having been made upon the company. A large majority of the men attempted to go to work last Monday, but were restrained by the threats of a mob of about 3000 men, mostly outsiders. We consider this strike a crime against the men that toil, and we believe it is a blow at the vitals of our government."

Motor Car Industry May be Forced to Suspend

Detroit, Sept. 30.—Michigan's extensive automotive industry may be almost suspended if the strike in the steel and iron industry continues two or three weeks. A week's suspension of some of the plants supplying the industry with materials has resulted in curtailment of production in some of the factories.

Most of the motor car and truck plants here are operating with but a week's supply of materials. A few of them are on a day-to-day basis, depending on shipments from Pittsburgh and Cleveland.

Directors of the Michigan Manufacturers' association representing 1500 plants in the state, 500 of which are in Detroit, have indorsed the stand taken by the United States Steel Corp., and have pledged their full support in "the fight for industrial liberty."

Automotive workers are among the highest paid in the country and there has been no movement as yet reported of their joining forces with the steel workers, morally, financially or otherwise.

Structural Steel Society Commends Gary

Chicago, Sept. 27.—The Structural Steel society, with offices in Chicago, has sent the following telegram to E. H. Gary, chairman of the board of directors of the United States Steel Corp., approving his stand on the proposal to arbitrate the present situation:

"The Structural Steel society, representing 32 fabricating plants in the Middle West, assembled today in Chicago, rejoices in your statement of last night refusing to arbitrate the principle of the open shop. We are glad to have such a leader as you in our crisis. You are right, it is our fight as part of the public as much as it is yours. You have an obligation to the nation beyond your immediate obligation to the Steel corporation. The principle involved is one in which the nation is vitally interested, and as you state cannot be arbitrated or compromised. We pledge ourselves to go home and in our several communities enlist the co-operation of all civic organizations to stand back of you and support you on the principles enunciated in your statement of last night. If there is any definite thing we can do please tell us. We are with you to the finish."

Support Steel Industry in Stand for Open Shop

Both the Bridge Builders and Structural society and the Steel Fabricators of the United States have adopted resolutions supporting the employers in the steel industry in their determination to stand firm for the open shop. The former organization, at a meeting in New York Sept. 12, adopted the following resolution offered by C. Edwin Michael, president of the Virginia Bridge & Iron Co., and former member of the war labor board:

"RESOLVED: That the members of the Bridge Builders and Structural society believe the proposed disturbance unwarranted and unpatriotic, and express confidence in the policy and management of the steel industry to maintain the principles of the open shop, and cordial and mutually satisfactory working conditions with its employes."

Foundrymen Meet in Convention

Registration of 800 at American Foundrymens' Association Annual Meeting Includes Representatives From Foreign Countries—First Session Given to President's Address and Welcome From Local Foundrymen—Many Papers Presented

PHILADELPHIA, Sept. 30.—With a total registration of about 800, including more than a score of manufacturers and foundrymen from England, France, Norway, Japan, India and other countries, the twenty-fourth annual convention of the American Foundrymen's association formally opened Tuesday morning under circumstances which forecast a week of eventful and valuable meetings.

In the annual address of the president, A. O. Backert, Cleveland, compared the problems now confronting foundrymen with those encountered during the war. He stated that as production was the one essential to overwhelm the enemy, so increased production is needed today to restore the equilibrium of trade and industry. Referring to his extended trip throughout the United Kingdom and France, he declared that mechanical appliances are not in such widespread use in the casting industry of those countries as in the United States. However, many plants are modernly equipped and their practice is equal to the best prevailing in this country. Repetition in England and France is not nearly so prevalent as in the United States and lack of standardization retards the output in the European countries. In England the converter process is used more than the open hearth which is just the opposite of the practice in this country where open hearth tonnage exceeds converter almost ten to one. After enumerating the courtesies extended to him during his visit, Mr. Backert extended a warm welcome to the large number of visitors from overseas attending the convention. "By their journey overseas they are helping to build a friendship which forever should tie together the allies of the great war," he said. In conclusion the president acknowledged the valuable work of the secretary-treasurer, directors of the association and members of committees and paid touching tribute to the late Maj. Joseph T. Speer, who died Jan. 5, 1919.

Following his address Mr. Backert read a letter from Thomas Firth, past president of the British Foundrymen's association. Mr. Firth acknowledged the value of the work of the American foundrymen including W. J. Keep, Richard Moldenke and Thomas West. He declared that increased production is the only solution for the present industrial problems.

In welcoming foundrymen to Philadelphia Thomas Devlin, who has been actively engaged in the foundry business continuously for 65 years, declared opportunities for success in the industry are far greater today than ever before. He recounted the early days of the Philadelphia and American Foundrymen's association. John A. Penton paid a tribute to Mr. Devlin's active interest in problems of the industry and referred to him as the premier foundryman of the world.

Edward J. Cattell, statistician of the city of Philadelphia, interestingly reviewed the achievements of that city in industry and science. Referring to the present labor situation, he spoke in an optimistic vein, stating that not more than 3 per cent of the workers of the country are touched by foreign heresy. J. P. Pero, past president of the association spoke on the growing importance of the literature contributed to the foundry industry through the technical papers of the association.

The nominating committee named by president is as follows: B. D. Fuller, Niagara Falls; R. A. Bull, Coraopolis, Pa.; J. P. Pero, East St. Louis, Ill.; A. E. Howell, Nashville, Tenn.; Stanley G. Flagg III, Philadelphia.

Following the address of the past president, Russell R. Clarke, Eagle Brass Foundry, Seattle, read a paper entitled "Considerations Affecting Brass Melting in Gray Iron Shops." The author presents in a simple manner a few of the considerations that should govern the occasional production of nonferrous castings in a gray iron shop. The importance of correct melting practice is emphasized, it being stated that molders make their own scrap; furnaces can make everybody's. In a paper by F. J. Ryan, American Metallurgical Corp., Philadelphia, it is pointed out that brass melting presents two vital problems, segregation and volatilization of zinc. Segregation can be prevented by stirring and volatilization can be avoided by holding the charge in a cold vessel. The author described a furnace invented by Charles A. Weeks which is designed to meet these conditions.

Harrison E. Howe, National Research council, Washington, spoke on the need for co-operative research in alloys. He mentioned in some detail the efforts being made by the national research council to conduct investigations of direct value to manufacturers. He pointed out that co-operation is especially needed in regard to research work on alloys and urged that manufacturers in the foundry industry give this matter their personal attention. J. Roy Tanner, Pittsburgh Valve, Foundry & Construction Co., Pittsburgh, submitted the report of the American Foundrymen's association committee on foundry costs. The report recommends that the association publish the standard cost system. Franklin G. Smith, Cleveland Osborn Mfg. Co., Cleveland, as chairman of the publicity committee of the Foundry Equipment Manufacturers' association, spoke on publicity work of that association.

Gary at Washington

Washington, Oct. 1. (By wire.)—Judge E. H. Gary, chairman of the Steel corporation, appeared this morning before the senate committee on labor and education which is investigating the steel strike.

Judge Gary and party of Steel corporation officials arrived from New York last night and this morning were ready for Judge Gary's appearance before the senate committee. Accompanying Judge Gary from New York were Richard V. Lindabury, general counsel; John Reis, vice president; James B. Bonner, Washington representative; W. J. Filbert, comptroller; C. L. Close, manager of the bureau of safety, sanitation and welfare, and others.

Du Puy Resigns

Herbert Du Puy has resigned from the chairmanship of the Crucible Steel Co. of America, Pittsburgh, his resignation taking effect Oct. 1. Ill health was given as his reason for retiring. His action follows a number of recent changes in the directorate and stock ownership of the company.

Handling Foundry Jobs By Crane

Classification of Patterns Will Aid Materially in Checking the Cost of Castings and in Systematizing the Usual Foundry Operations — Hoisting Equipment is Indispensable for Producing Maximum Results

BY W. C. BRIGGS

LABOR costs are fast becoming a big problem with all foundrymen. They exist from the time the raw materials arrive until the finished castings are loaded. In order to reduce the number of common laborers to a minimum, designers give entirely too much consideration to the handling of raw materials, loading of castings, etc., where the total pro rata cost per ton is a much smaller factor than the skilled workman's time on the molding floor.

This, of course, is not true in all cases, but is apt to be true in the case of the jobbing foundry where the owner or engineer has in most cases failed to find a means for making a layout of the foundry with foundry floors, cranes, hoists and molding machines so combined that they are adapted to handle to advantage a predetermined class of work.

If, however, each pattern when received is placed in a definite classification as outlined in the accompanying table it will be possible to use hand molding and hand lift where it can be used with the highest efficiency, and hand molding and crane equipment where it will be more efficient, and likewise machine molding and hand lift where these factors can be combined to produce the largest tonnage.

Tag Patterns According to Classification

The writer has not intended to carry this classification into all the sizes of flasks or depths of cope and drag that some foundries no doubt find it advisable to classify, but sufficient to outline the general scheme. The plan proposed is to place this classification list in the hands of the patternmaker or the man who has charge of the flasks so that suitable tags or stencilled markings may be applied to the individual patterns.

Tonnage of casting is influenced largely by the ratio between the size of the flask and the weight of the casting and the cost of molding follows in much the same ratio. Therefore with a system of this kind, the matter of setting the price is simplified. For instance, if a casting weighing 50 pounds is produced in classification No. 1, the same casting produced in class No. 2 would cost more, and by keeping the cost of castings made by each classification, a table soon could be prepared that would be of great assistance in estimating the cost of making all kinds of castings.

Of course there are many other elements that enter into the cost, but most of these elements do not influence the price anything like the ratio between the size of flask, which governs the amount of labor to a large extent. It is realized that green sand and dry sand molding costs vary, and that the kind and size of cores are important elements.

These classifications also will help to solve the cost problem which has

A paper presented at the annual meeting of the American Foundrymen's association, Philadelphia, Sept. 29-Oct. 3. The author, W. C. Briggs, is associated with the Shepard Crane & Hoist Co., New York.

FIG. 1—THE WORK NOW HANDLED BY THIS CRANE FORMERLY WAS HANDLED BY A JIB CRANE. PRODUCTION WAS INCREASED 4 TIMES BY THE USE OF THE CRANE SHOWN

Method for Classifying Patterns

Class	Size of Flask	Hand Molding		Machine Molding	
		Hand Lift	Crane Lift	Hand Lift	Crane Lift
1	18 x 18 x 6	1—HMHL	1—HMCL	1—MMHL	1—MMCL
2	18 x 18 x 12	2—HMHL	2—HMCL	2—MMHL	2—MMCL
3	24 x 24 x 6	3—HMHL	3—HMCL	3—MMHL	3—MMCL
4	24 x 24 x 12	4—HMHL	4—HMCL	4—MMHL	4—MMCL
5	24 x 30 x 6	5—HMHL	5—HMCL	5—MMHL	5—MMCL
6	24 x 30 x 12	6—HMHL	6—HMCL	6—MMHL	6—MMCL
7	36 x 36 x 6	7—HMHL	7—HMCL	7—MMHL	7—MMCL
8	36 x 48 x 8	8—HMHL	8—HMCL	8—MMHL	8—MMCL
9	36 x 48 x 12	9—HMHL	9—HMCL	9—MMHL	9—MMCL
10	48 x 48 x 8	10—HMHL	10—HMCL	10—MMHL	10—MMCL
11	48 x 48 x 12	11—HMHL	11—HMCL	11—MMHL	11—MMCL
12	48 x 60 x 12	12—HMHL	12—HMCL	12—MMHL	12—MMCL
13	60 x 60 x 12	13—HMHL	13—HMCL	13—MMHL	13—MMCL
14	60 x 72 x 12	14—HMHL	14—HMCL	14—MMHL	14—MMCL

been found so difficult in foundries turning out a large variety of work. It is a well known fact that there is a limited amount of foot pounds of work for every man. It varies somewhat with the man, but just as sure as a man's energies are properly applied, just as sure will he produce more and better results. If it is necessary for a molder to go to the pattern loft or flask shop to get his pattern and then to select or fit up a flask or assist the patternmaker or flask man to do so, and then get his floor ready, cut up his sand, find the necessary rigging, gagers, etc., he is not going to get started to make his job with as much dispatch as he would if a system was used whereby these factors were taken care of in a systematic way. There may be some work that can be rammed by hand or by treading in with the feet at as low a cost as can be done by any other method, but such jobs are few and far between and a good skilled mechanic should never be used for that kind of work.

As many modern foundries are designed light is the main consideration. Those that make a large variety of work from castings weighing a few pounds to those weighing several tons frequently do not have facilities for handling the kind of work they are to make. Often no attempt has been made to establish even approximately the floor area required or handling facilities best adapted for the particular kind of work to be made because the designer did not have a clear conception of the size and weight and volume of each kind of casting to be made. If, however, the pattern is classified when received or made, into the size of flask which automatically establishes the approximate volume of sand and weights to be handled, the problem of designing the building, distributing the work, providing molding machine and crane equipment can readily be solved.

The work shown in the foundry, Fig. 1, was formerly made under a jib crane. Three men had to put in a long hard day to produce nine or 10 molds. This job was fitted up to be made on a molding machine and an electric traveler arranged with controllers operated by pendant cords designed so that any one of the men in the gang could handle the flask to the molding machine and mold to the floor was provided. After one man had placed the cores, another could operate the traveler and close the mold, two additional men were added to the gang making five men to serve the molding machine, set the cores and close the mold. The men produced 44 molds for a day's work and did not work as hard as with the old combination, producing less than one quarter of the number of castings.

Fig. 2 shows a foundry with a central bay served by travelers placed on two levels. On the lower level are three 3-motor electric cranes, arranged for control by pendant cords from the floor, each crane having a capacity suitable for handling the largest mold to be made, but not largely in excess of the capacity required. On the higher level the cage-operated machine is of higher speed

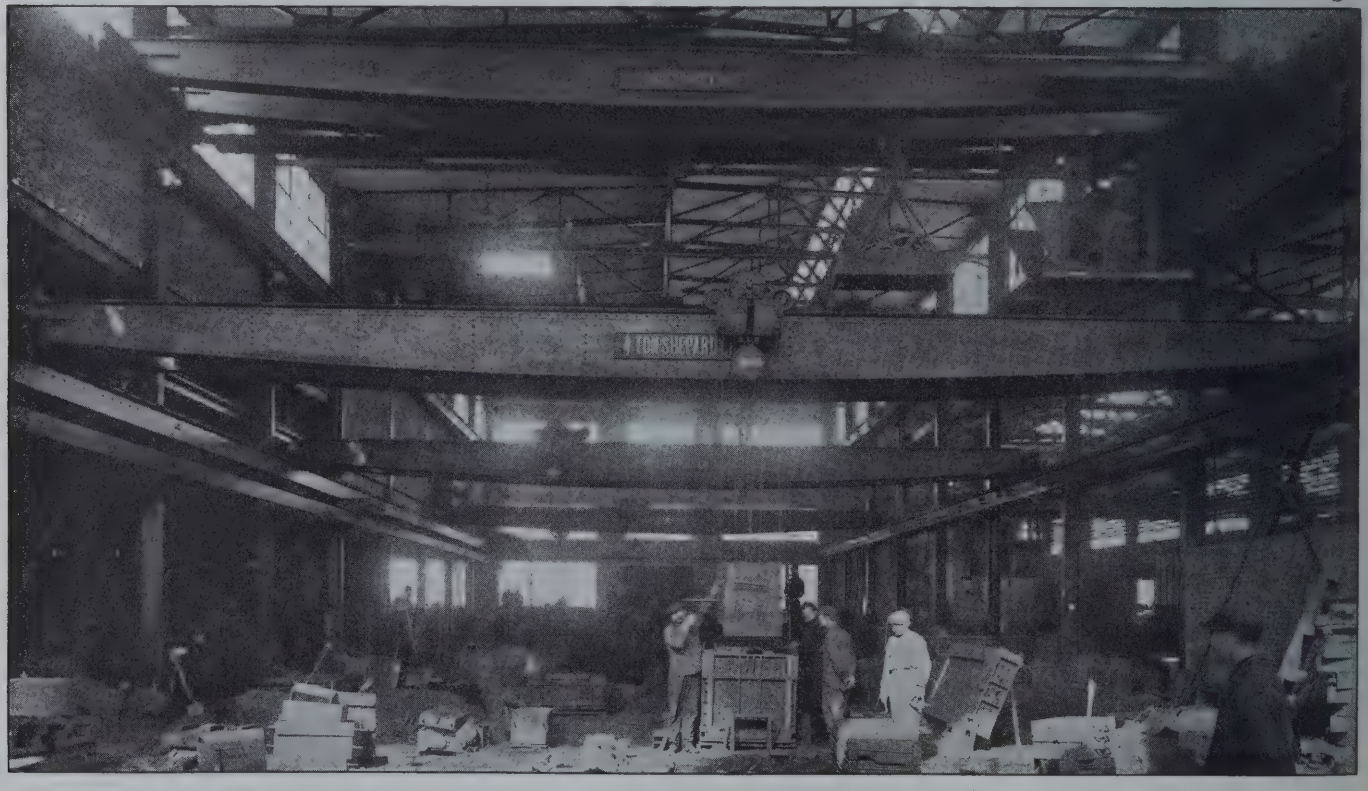

FIG. 2—CENTRAL BAY OF FOUNDRY SERVED BY CRANES ON HIGH AND LOW RUNWAYS. THE THREE CRANES OPERATING ON THE LOWER LEVEL ARE USED IN CONNECTION WITH MOLDING

FIG. 3—MATERIAL STORAGE YARD OF FOUNDRY WHOSE INTERIOR IS SHOWN IN FIG. 2. MATERIALS ARE HANDLED BY THE CRANE AND MONORAIL HOIST SHOWN

and is used largely for distributing flasks, taking out castings, and when necessary, carrying large ladles of iron over the top of the lower cranes without interfering with the molding operations. The side floor of this foundry is equipped with two 2-motor electric travelers, arranged for control by pendant cords. These machines are of light capacity, designed to perform the particular operations required of them. The core room, extending the whole length of one side of the foundry is served by a light capacity quick-acting overhead traveler.

The crane equipment in this foundry is nearly ideal, but by applying the system of classification of patterns and by making a study of the average number of castings made in definitely established flasks and by selecting the best molding machines for the work, a much larger tonnage could be produced with the same number of men. While the item of handling materials is low per ton of castings produced, many foundries are operating with high costs that can be lowered economically by the application of properly selected handling equipment.

Fig. 3 shows the material storage yard of the foundry shown in Fig. 2. Pig iron, coke, sand, etc., are moved mechanically throughout. Pig iron is unloaded from the cars by magnet to the yard and as required delivered to the charging platform by the crane and monorail hoist, clearly shown in the illustration. The only man labor is used in charging the cupola from the scales located on the platform.

Efficiency engineers have done much to lighten the burden of the manufacturer and the man who does the work but it is no easy task to get these parties thinking along the same lines. Many foundries, especially the jobbing foundries, can greatly increase their production and make the job easier for both owner and workmen by giving more careful study to the pattern before it goes to the foundry and by standardizing flasks and then allotting as far as possible, definite floor space, suitable handling facilities and molding machines for the work.

Electric Furnace an Adjunct to Cupola

BY GEORGE K. ELLIOTT

THE advantages of a duplex process using the electric furnace as an adjunct to the cupola for melting gray iron were outlined by George K. Elliott in a paper presented at the annual convention of the American Foundrymen's association held in Philadelphia, Sept. 29-Oct. 3. The author called attention to the fact that while the cupola is an efficient furnace for melting iron it has certain limitations which prevent it from furnishing an iron which entirely meets the requirements for certain classes of castings. But for the ordinary run of iron castings, comprising possibly 90 per cent of the total output of the country there was said to be no valid economical reason for either displacing or radically modifying the modern cupola.

The author goes on to say that whatever its faults may be, it must be acknowledged that for preheating iron up to the point of melting, and after that performing the fusion itself with a minimum waste of heat, the cupola stands supreme among the established foundry furnaces. Its melting efficiency approximately is 40 per cent although in the hands of the unskilled it may fall as low as 25 per cent, while the adept may drive it along at a rate of as high as 50 per cent efficiency.

Although the cupola is practically

without rival as a preheater and melter it does not attain the same high rank as a superheater of molten metal. The cupola operator's problem in obtaining superheated iron is largely one of circumventing terrestrial gravitation as it is manifested in the speedy dripping of the molten iron through and away from the hottest zone of the cupola.

In the two-step process that has been described, all responsibility for superheating is taken from the cupola and assigned to the electric furnace, where with the greatest ease it can be superheated to a degree that is not possible in any other kind of furnace. Superheating in the electric furnace enables the foundryman to make castings of low-phosphorus iron which otherwise it would be necessary to make of high-phosphorus iron, because he can safely shift the responsibility for fluidity from the material to the furnace.

Another advantage, and by no means a minor one, is that hot iron tends to increase solidity in castings. By solidity is meant not only closeness of grain but freedom from internal imperfections such as blowholes, shrink-holes, slag inclusions, graphite segregations, or like defects.

The process of treating iron in the cupola cannot be extended beyond the point of melting and a certain limited amount of superheating. Any additional operation such as refining, is entirely out of the question and can be performed only in some other kind of furnace. In considering the electric furnace in relation to refining it is preferable to consider separately the acid-lined and the basic-lined furnaces. The acid-lined furnace refines entirely through maintaining a constant reducing atmosphere in contact with the metal. The refining in an acid furnace is one of deoxidation coupled with a freeing of the bath from included gases and slag.

One must turn to the basic-bottom electric furnace to find potentiality in refining at its greatest. Almost any metallurgical reaction may be conducted in it, including oxidation, reduction, dephosphorization, desulphurization, decarburization, carburization, mixing with ferroalloys, superheating, and others. The duplex process for cast iron is chiefly concerned with reduction, desulphurization and mixing.

Standard pig iron containing a maximum of 0.05 per cent sulphur contains from 0.07 to 0.11 per cent after coming from the cupola, the degree of contamination depending upon the quality of coke, the condition of the cupola and its accessories, and the skill and knowledge of the cupola tender. The same iron from the cupola may subsequently have its sulphur reduced to about one-third or one-fourth by 30 or 40 minutes refining in a basic bottom electric furnace. The average of a great number of *duplexed* heats of gray iron was 0.088 per cent sulphur in the melt from the cupola, while in the final product from the electric furnace the average was 0.036 per cent. As low as 0.009 per cent sulphur in occasional heats has been produced in gray iron under everyday working conditions with little difficulty.

The electric furnace step of the duplex process is particularly good for mixing. It enables a perfect mixing of the original raw materials, assuring homogeneity in the single heat, and it facilitates the accurate duplication of results, assuring uniformity among several heats. It also simplifies and insures the perfect admixing of alloys such as ferrosilicon and ferromanganese. The electric furnace allows steel scrap to be mixed with the iron and by this means the amount of total carbon in the metal can be controlled, while when steel scrap is mixed with iron in the cupola an indefinite amount of carbon is taken up from the coke.

Educational Value of the Scrap Pile

BY HENRY TRAPHAGEN

DEFECTIVE castings—the tenants of the scrap pile—offer to the discerning and ambitious foundryman knowledge that is beyond price. The real value of the scrap pile depends upon whether the defective castings are intelligently examined or whether they are buried away under old barrels. Intelligently examined and constructively criticized, a defective casting will invariably point out the antidote.

The up-to-date foundry should have at least one competent, experimental molder, who is paid by the day, and not hurried; his business should be to investigate the proper method of gating and heading castings as they come into the shop. When the casting comes right, then it should be either sketched or photographed with the gates and heads attached, and a permanent record made. If the same job comes back a year or two later it is immaterial whether the experimental molder is in China or the superintendent in parts unknown; that casting can be made again, for the method of making it is on record.

Show Characteristic Defects

At first sight, it appears that experimental molding is an almost endless task; that the experimental molder has to start out on an entirely new task every time a casting comes into the shop, and that the number of records necessary is almost overwhelming. However, if foundrymen will carefully investigate this method of experimental work, they will find that after all, the number of real basic defects that are found in castings are comparatively few. They will discover that castings naturally group themselves into a few well defined classes, and that each class is subject to characteristic defects that are easily recognized, and in a short time they will learn to discount possible defects at the start.

Several fundamental difficulties that are met in foundries have been described in the literature on the subject; but unfortunately these descriptions seem to be lost in a maze of words dealing with the various peculiarities of chemical ingredients, new methods of chemical analysis, long discussions on grain aggregates, and in fact, almost everything except a frank, plain discussion of the foundryman's troubles.

If the foundryman will carefully study his defective castings the writer believes that he will ultimately find that all of the defectives can be traced to one of the following fundamental errors:

First—The personal equation, or in other words, the carelessness of the workman.

Second—Over-production, which puts a premium on careless, sloppy work.

Third—The attempt to make good material out of junk.

Fourth—False economy, which results from the use of too little fuel, too much scrap, cheap refractories and too

Abstract of paper presented at the annual convention of the American Foundrymen's association, Philadelphia, Sept. 29-Oct. 3. The author, Henry Traphagen, is metallurgist of the Toledo Steel Casting Co., Toledo, Ohio.

great a reliance in green sand molding practice.

Cold iron due in a false economy in the use of fuel is a common error. It is a simple matter to determine whether or not the bed is low. Leave the tap hole open, turn on the blast, and note the time that it takes for the first metal to run over the spout. If iron appears in less than 10 minutes, it is almost a certainty that the bed is too low. A low bed means dirty, porous, weak castings, owing to the metal melting directly in front of the tuyere blast and becoming unduly oxidized.

Another prolific source of cold metal lies in the attempt to conform to a prearranged melting ratio. In the dictionary of common sense there is no such term as melting ratio. The correct melting ratio is the amount of coke that will give hot, fluid metal; and this amount of coke will vary with the size of the cupola, the amount of scrap used, the kind of coke, the percentage of steel used in the mixtures, and the size and condition of the sprues. It is therefore evident that it is ridiculous for anyone to attempt to lay down a specific melting ratio for cupola practice.

Cold metal in the converter can generally be laid to one or two causes. The metal from the cupola may be cold for one of the reasons just enumerated; the percentage of silicon may be too low for successful blowing, or what is most common, the lining of the converter may be too wet, or there may be a leak in the wind chest or somewhere along the line. It is rarely found that cold metal can be traced to a variation in chemical content, and before the foundryman wastes any time fooling around the laboratory, it is far better for him to examine his cupola practice, his converter linings and his wind apparatus.

There is another great fundamental cause for cold iron, it is found not only in the cupola, but in the converter, the air furnace, the open-hearth furnace, the crucible furnace and even in the electric furnace. Reference is made to the effects of oxygen which causes oxidized metal. There is no disputing the fact that foundries very frequently receive shipments of pig iron that will not produce hot iron, no matter how careful the melting practice may be.

If, on breaking a shipment of iron it is found to be consistently unsound and full of gas cavities, reject that iron if it is possible to do so. But if the furnace absolutely refuses to take such iron back, which often is the case, then the only course left to the foundryman is to hold the shipment in the yard and use it very gradually, say one pig to a charge, until the pile is gone.

Another source of cold, sluggish iron and steel lies in the use of thin, dirty, rusty scrap. Such material is finely divided. During the melting process this rust or oxide enters the metal and becomes emulsified. No amount of fluxes, deoxidizers, or other cleansing agents will get it out. I believe suspended oxides in metal are causing more trouble today in the iron and steel industry than any other one thing. The use of such material is directly at variance with all the sound principles of metallurgy. Cold metal affects the molding department so strongly that the molder must take it into consideration. It is a well known fact that the moment molten metal strikes the sand a large volume of gas is generated. This gas is formed from the decomposition of binding materials, but most of it comes from the water in the sand.

If such gas is not allowed free exit, it is going to be trapped in the metal, the colder the metal is the more quickly it will set, and the more likely it is that the gas will be trapped under a frozen skin; this is a very common defect in green-sand molding; hence the necessity when attempting to make green-sand work, of having the metal very hot and fluid and venting not only the cope but the drag, and making sure that the vents in the cores are wide open.

The Sins of the Cover Core

An interesting sidelight in connection with this discussion is the question of using oil-sand cover cores. It is a very common occurrence to find a casting made under a thick, hard oil sand cover core, with absolutely no provision for the escape of gas. The foundryman struggles along and probably gets two out of ten castings, whereas if he would merely puncture the cover core with three or four pop heads and let the gas out, the probabilities are that all of the castings would come good.

The question of shrink heads or risers is one that is given too little consideration in the foundry. A head to be of any value, must be large enough in cross section to remain open until the casting has set. It is well to remember that probably not over 30 per cent of the cross section of a head is available for feeding and this statement applies with more than ordinary force to the neck of the feeder; it is folly to make a great big head and then neck it down so narrow that the neck freezes almost instantly, and it is equally futile to expect a head to feed if it is not placed squarely upon the casting. How often does one find a head with a neck say 2½ or 3 inches in diameter about one-fourth of which is attached to the casting and the rest wandering off in space.

A casting may look sound, but millions of tiny bubbles of exploding steam have made it porous so that it will not stand up under gas or water pressure. It is possible to make hydraulic castings in green sand molds, but it is not possible to make them day in and day out and be fairly certain that they are all sound. It is almost an impossibility to control the water in the green sand mold; and water suddenly converted into steam has a habit of exploding in the most unforseen places and in the most peculiar ways. As a general rule, a hydraulic or gas casting should be made in a thoroughly baked mold; if proper materials are used, the melting carefully done and the mold kept clean, there is no trick in turning out acceptable hydraulic castings.

There is one more item in the molding department that deserves attention and that is the proper method of pouring. The scrap pile receives a great many contributions because of the carelessness or incompetency of the man at the ladle. Every ladle of metal should be held for a minute or two to allow the slag and other impurities to come to the surface. Metal going into a sand mold should be poured evenly and carefully and under no consideration should hot metal be poured at high pressure directly over a large flat area of sand. Cuts and scabs and snakes are too often the result of fast, furious pouring. It is far better when dealing with a casting having a large flat surface, to cut back-up gates and break the force of the stream of metal rather than resort to a mass of finishing nails, a lot of swabbing to prevent the facing from cutting.

Another exceedingly common error is the practice of pouring metal at right angles directly up against a core. If it is possible to allow the metal to slide parallel to the core, there will be far less cutting and much less dirt.

The value of a scrap pile lies in the fact that it offers a real course of instruction in foundry practice, and this paper has been written in an attempt to induce the foundryman to commune with his defectives, to study their peculiarities, to grasp the principles of casting in their broadest sense, and to realize his responsibility to the community.

Audible Signals in the Foundry

Acoustic Devices Including Electric Horns, Steam and Air Whistles, Bells and Gongs Afford Economy, Efficiency and Safety of Operation—Description of a Code-Calling Instrument—How to Select Proper Signals

BY VLADIMIR KARAPETOFF

IN various foundries the following types of audible signals are actually in use: Electric horns similar to those used on automobiles; air or steam whistles, sometimes electrically operated from a distance; and bells and gongs, either single stroke or continuous. In an efficient up-to-date foundry such audible signals should be used for at least the following purposes:

1—For calling any important employe to the nearest telephone no matter where he may be; this presupposes a prearranged code and some simple device for sounding calls.

2—As extensions to telephone bells in noisy places; a foreman may not hear his telephone bell when away from his desk, but he would most likely hear one or more loud horns or shrill whistles mounted in the shop.

3—For purely local needs and signals, for example, to indicate the beginning and the ending of pouring, to call a craneman or an electrician to some prearranged place, etc.

4—As warning signals of danger on cranes, hoists, locomotives and trucks, especially when a ladle with molten metal is in motion.

5—For sounding fire-alarms.

Imagine yourself sitting as an observer in the molding and pouring department of a large foundry properly equipped with audible signals. You will soon hear one or more electric horns sounding a code number, for example, one, one and two (1-1-2). This may mean that the superintendent is wanted in his office, but that there is no particular hurry about it. Had the call been one, two, two (1-2-2), it would have meant a hurry call and you probably would have seen the superintendent running to the nearest telephone.

Soon afterward you may hear two long blasts of an air whistle, signifying that everything is ready for pouring in the north aisle. A few minutes later it might be followed by a continuous ringing of a bell to warn the workers that a big ladle full of molten metal is being carried by the crane.

To make the picture complete, let us imagine that after a time you hear a single-stroke gong sounding number four three (4-3). This may designate a fire in the pattern shop, or many simply be an agreed call for a fire-drill.

By Way of Contrast

For contrast, let us go to an out-of-date, shabby, primitive foundry, which is still running on the "chance and luck" principle, found to be satisfactory by our forefathers. In those days a molder received a dollar or two for a 12-hour day, and the output was measured in pounds where it is now stated in hundreds of tons. Two or three office boys are running all over the works trying in vain to locate the superintendent who is needed in the office to help on an important quotation. When he is finally located, it is too late to take care of this matter in the proper way. A millwright is needed in a hurry to take care of a hot bearing on a rush job, and nobody knows where he is. He happens to be attending to an unimportant job in a dark pit, and is blissfully ignorant of the fact that he is urgently needed elsewhere.

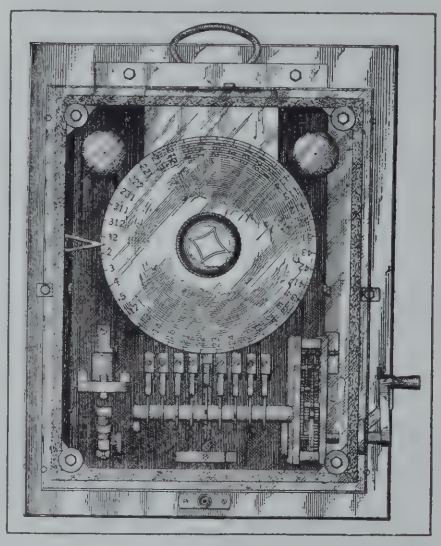

FIG. 1—A CODE CALLING MECHANISM

The operator sets a code number and pulls on a handle. This closes the electric circuit the required number of times, and sounds the signal.

Actual experience not only in foundries but in all kinds of industrial establishments has demonstrated the importance of audible signals in promoting both the efficiency and the safety of operations. Horns, bells and whistles are simple pieces of apparatus available on the market. Their cost is trifling in comparison with their useful service, and any far-sighted foundry manager can readily see the great advantage of equipping his works with acoustic signals, once the matter has been properly brought to his attention.

The following are the principal *sources of noise* in a fully equipped foundry:

Molding Department.—Vibrators for loosening sand from patterns, jar-ramming machines, cranes, trolleys, hissing of compressed air; noise of conveyors, trucks, wheelbarrows, etc.

Cleaning or Trimming Room.—Tumbling barrels, air chisels, pneumatic drills, grinding wheels, scrapers, band saws, conveyors, sand-blast machines, hissing of escaping air.

Sand Mixing Room.—Gears, chains, disintegrator hammers, magnetic separator for iron stays, and electric motors.

Melting Room.—Roar of blowers and of combustion (especially when burning oil); cranes and conveyors. Not very noisy.

Core Department.—Hammering, jar-ramming machines, escaping air, gas or oil furnaces, sand conveyor, a traveling crane and trucks.

Welding Department.—Roar of the oil-burning furnaces for preheating defective castings; hissing of the oxy-acetylene flames; handling, hammering and dragging of castings.

Fig. 1 shows a simple device for sounding simultaneously any desired number of horns, whistles and gongs scattered throughout the works, and for calling various persons according to a prearranged code. The electrical connections are shown in Fig. 2. The device consists essentially of a number of toothed wheels which close and open an electric circuit in a certain sequence. These wheels are mounted on a shaft operated by a clock spring. A drum is provided with a combination of 40 simple arrangements of contacts, such as 1-2, 1-3, 2-3, 1-1-2, etc. The horns are connected to an available 110 or 220-volt circuit either direct or alternating current while only a small current from a few dry cells is used in the central instrument. This current closes a relay which operates the power circuit between

From a paper presented at the annual meeting of the American Foundrymen's association, Philadelphia, Sept. 29-Oct. 3. The author, Vladimir Karapetoff, is professor in the electrical engineering department, Cornell university.

two contacts especially designed for frequent opening.

When it is desired to call some person, the code handle *A* is set on the number assigned to that person, and the operating handle *B* is turned by one-half a revolution. This is all the operator has to do. The contact shaft is set in motion by the spring and the circuit is closed a certain number of times in acordance with the position of the code drum. Every time the battery circuit is closed the relay closes the power circuit and operates all the horns, whistles, gongs or lamps connected to it. Having sounded the complete call three times the handle *B* returns to its original position and the mechanism is ready for the next call.

In most cases it is considered sufficient to sound the call number three times. The first time the person may not be sure whose call it is, the second time he counts the sounds and the third time he checks himself. For exceptional purposes, the call may be sounded more or less than three times or even continuously until stopped.

How the System Operates

The operation of the code-calling mechanism is usually entrusted to the telephone operator, where a private branch exchange is available. If the manager needs Mr. Jones and fails to reach him by telephone at his desk, he tells the telephone operator to sound his call number. Mr. Jones may be anywhere in the works, but as soon as he hears his number he comes to the nearest telephone and reports to the telephone operator who immediately connects him with the manager's telephone. Special cases have arisen in which the operation of the code-calling instrument had to be entrusted to a clerk in the superintendent's or production manager's office, in order to prevent office boys, clerks, etc., from disturbing important members of the staff on trifling occasions. The operator of the calling device is supposed to inquire about the nature of the business before starting the call.

When the number of persons to be called is not great, say 10 or 12, it is sometimes convenient to assign two or three different numbers to the same person. These three numbers may mean respectively: (1) "Call me on the phone immediately;" (2) "Call me when through with the present engagement;" (3) "Come to the manager's office."

The particular rules for the use of the code-calling equipment differ from factory to factory in accordance with the local conditions, and may be modified from time to time as actual experience indicates.

Some care must be exercised in the selection of the type of sound-producing signals and of the number of such devices in each department. A buzzer or a bell would not be heard near a tumbling barrel or a sand disintegrator; on the other hand, a powerful electric horn would be out of place in an office. Each signal must be distinctly heard under the most intense noise possible in that department by a person most unfavorably situated with respect to the signal. At the same time it would be a mistake to use unnecessarily strong signals, which are liable to get on the workers' nerves.

The pitch of the signal (high or low voice) is another factor to be considered, and while no accurate experiments are available, the selection should be governed by the principle of contrast. In a shop with a low-pitch rumbling and howling noise a shrill signal is more liable to be heard, and vice versa. Again, where the noise is of a discontinuous percussion type, like hammering or riveting, a horn with its steady sound would immediately attract attention. On the other hand, where the noise is continuous like that of a blower, a loud single-stroke bell might cut through the noise more readily.

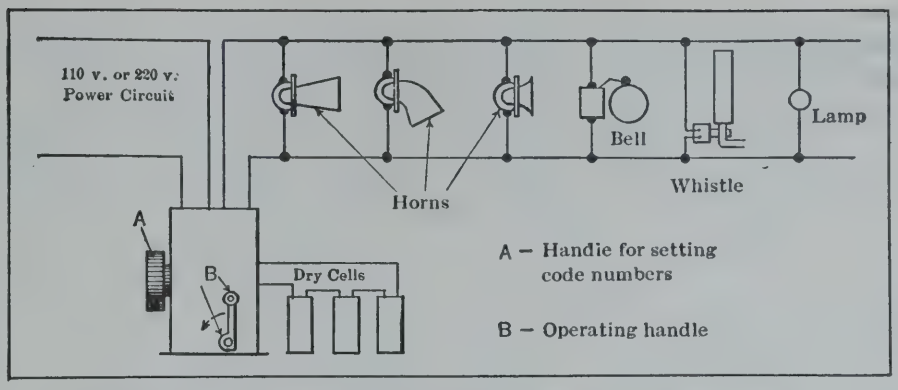

FIG. 2—THE ELECTRICAL CONNECTIONS FOR THE CALLING MECHANISM
A local battery closes a relay, which in turn closes the power circuit, to which the audible devices are connected in parallel.

Training Foremen to Lead Enlightened Labor

"The low educational caliber, in economic matters, of the foremen in most of our industries is remarkable, considering the effective part they might play in happily adjusting industrial differences at their inception," says John Calder, consulting engineer, New York, in a paper read before the American Foundrymen's association at its annual meeting in Philadelphia, Sept. 29-Oct. 3.

"This is not wholly the fault of the foremen," he continued. "They are usually selected largely for their technical proficiency in their own particular branch and then are forgotten by the management so far as the engineering of men is concerned. The generous treatment of foremen and the steady drawing-out of their capacities for leadership and for interpreting to workmen the policies and ideals of liberal-minded owners is the open secret of some of our most happy and contented businesses."

Favors Industrial Representation

Mr. Calder, who wrote on the subject, "Industrial Democracy and the Foreman," said that much good may be accomplished by means of the democratic form of representation in industry, but that its possibilities are limited unless foremen bring economic education into the meetings of shop committees. His views in this respect are opposed to those of some industrial concerns which, in extending representation to their workmen, have made it a point to exclude foremen from membership in committees, on the grounds that workmen consider them representatives of the management.

This is a point on which there is some difference of opinion, but as Mr. Calder goes on to say: "Certain it is that no ideas which we fail to sell to our foremen can be permanently conveyed to our workmen, and while a wealth of endeavor is being expended on the moving soil of labor at present we should not overlook the permanency of a liberal investment in the education of our numerous minor executives."

Mr. Calder, who has conferred with several thousand executives and foremen affiliated with industries in ten states on employe representation and the training of foremen, states that good results are obtained with intensive three-month courses for foremen, in which the principles of human engineering are presented in interesting form. He displays a sym-

Solving Problems of Personnel

Establishment of Definite Policy, Proper Interpretation of the Policy and Practical Application of Details, Three Most Important Factors in Securing Proper Industrial Relationship

BY C. D. DYER, JR.

THE consummation of satisfactory industrial relations requires hearty co-operation from all concerned. It is not enough that the employer should comprehend the viewpoint of the employed. The latter must with equal candor appreciate and accept the ideals and purposes of the former. No common interest can or will exist unless it is based upon mutual understanding and respect. Once a common purpose is established, misunderstandings, as a rule, can be quickly and amicably adjusted.

The three most important factors in securing and retaining a proper industrial relationship are the establishment of a definite policy, which is not easy; the proper interpretation of such policy, which is even more difficult, and the practical application of details in connection therewith, which is vital.

Too much consideration cannot be given to the problem of establishing a definite policy. To be of value, it must be formulated with the idea in mind of permanency, rather than expediency. It must provide sufficient elasticity to readily meet local or changing requirements. Any plan bordering on the paternalistic, philanthropic or welfare type of relationship, that has given rise to so much misunderstanding in the past, must be avoided.

Must Present Opportunities to All

Certain general provisions are necessary. Opportunity should be presented to every member of the industry, be he employer or employed, for advancement, financial remuneration, and development as a citizen and community member, according to his contribution to the industry and to society at large. Multifarious complications enter into the drafting of a just system of rewards. For this reason, an intensive study of every phase of the situation should be made. This may be termed the merit system, but whatever its terminology, it is essential to mutual understanding.

The fact that an adequate return on investment must be forthcoming and that sufficient capital resources are essential prerequisites to the development and extension of industry and the weathering of lean periods, must be mutually recognized. This principle may be termed the proprietary factor of safety. It is, of course, directly interlinked with a just system of rewards. Mutual recognition of these inseparable factors is essential to mutual confidence.

The policy should embrace the teaching of the principles of Americanism throughout the organization. There are in our midst those who either cannot or will not subscribe to anything constructive. We all must acknowledge that this condition is one of the most serious problems of both employer and employed. The first type will be taken care of by the employed, provided the right atmosphere is created. Disloyalty and unsound thinking will never flourish in American industry if the environment is right, even though they at times appear to be taking root.

Men of the second type, who, by reason of earlier lack of advantages and education, have not the mental capacity to grasp the essentials of and necessity for American citizenship, present a problem requiring constructive and persevering effort that cannot be sidetracked. Coercion is not the remedy. The creation of the desire through precept and example is the initial requirement and furnishes the basis for an actual solution through educational means of a more tangible nature later. It is essential that this important provision be given especial consideration. The fact that these types are in the minority permits an approach to a common interest goal to a certain extent, but much constructive work is needed before all types of employed, and in many cases employers, will have their vision so developed as to grasp the principles of the square deal as interpreted in this country, when they are at hand.

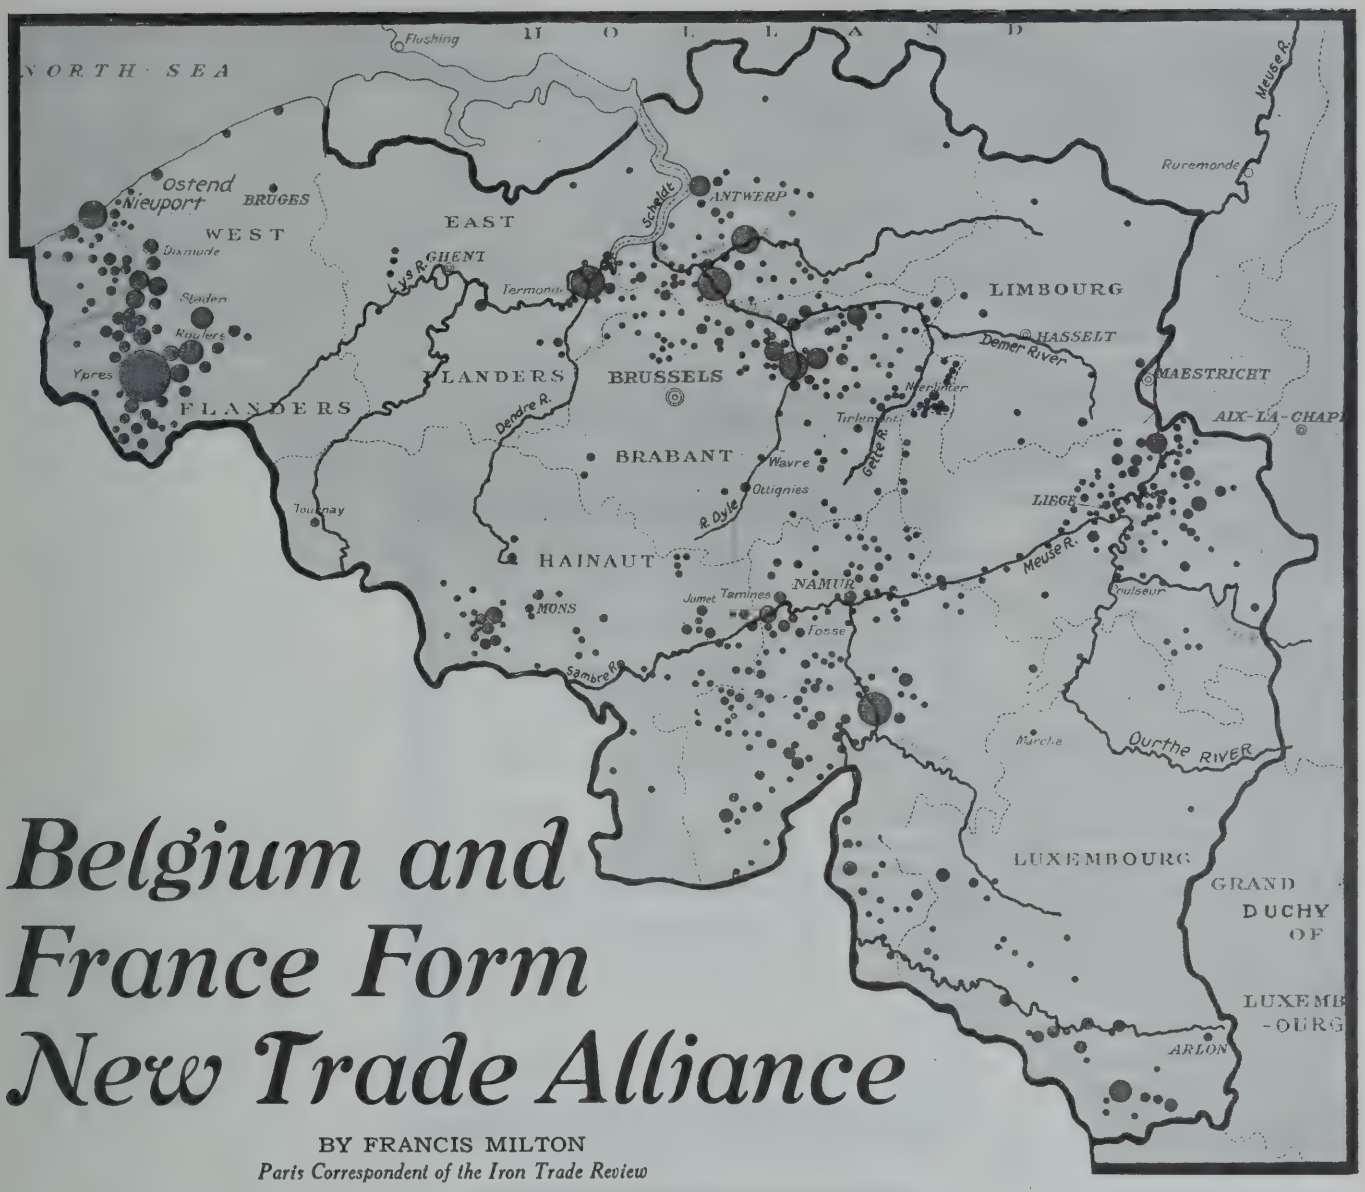
Proper representation of both employer and employed in the formulation of the policy is advisable. Such a procedure will assist in determining a basis of common interest founded on mutual appreciation of the problems of both, and will aid materially in furthering the aims of the policy.

Unless these four principles form the basis of a policy, interpretation and practical application become makeshifts. Strong personalities may triumph temporarily, but the structure created on a poor foundation cannot permanently withstand the storms that it must weather.

The size of departments handling industrial relations varies from one man in a small plant to large numbers in large industrial establishments. It is customary in the latter to have several highly specialized subdivisions, with a functional type of organization. The usual subdivisions are employment, service, and hospital; further functionized as follows:

EMPLOYMENT—This function usually embraces recruiting, hiring, adjustment of problems arising out of and in the course of employment, and discharging.

SERVICE—Under this function is usually included safety, compensation claims and adjustments, housing, washrooms and lockers, transportation, legal aid, loans, education, mutual benefit and other employes' insurance societies, employes' activities—religious, musical, social, athletic, etc.—Americanization training and assistance in securing citizenship papers, commissary, cooperative stores, publications and general service to employes.



HOSPITAL—This function usually includes medical, surgical, dental and visiting nurse service and sanitation.

Duties of the Employment Department

An employment department is essentially a sales agency. It must have access to an available supply of its commodity for the prompt filling of requisitions of varying specifications. In its transactions it has two customers. One is the man to whom it must sell the job. At this stage careful selection is essential, because the second customer, the requisitioner, must be presented with a product which will satisfy his requirements. If both are satisfied, all is well.

However, the employment department must operate upon the principle that its customers are always right. Goods falling short of specifications are returnable. It must stand behind its sales and be prepared to make all necessary adjustments.

From a paper presented at the annual meeting of the American Foundrymen's association, Philadelphia, Sept. 29-Oct. 3. The author is a member of Hunt & Dyer, Philadelphia.

Belgium and France Form New Trade Alliance

BY FRANCIS MILTON

Paris Correspondent of the Iron Trade Review

DESPITE trade jealousies that existed before the war, France and Belgium have joined hands for their own economic welfare. The writer heard the speech of welcome made in Brussels to President Poincare of France, and also heard the reply. Politics apart, the speeches may be said to have argued for close economic and trade co-operation. King Albert said:

"Belgium more than ever counts on the support of France to assure the benefits of peace, and to aid in achieving happy and profitable commercial relations. This reconquering of economic life which has been so sadly ruptured is one of mutual interest."

The reply of President Poincare was in part as follows:

"France will never forget that it was Belgium that held back the first tidal wave of German imperialism. In the light of this inextinguishable remembrance the two countries should go hand in hand to the solving of their contiguous commercial and economic problems so indissoluably bound up, one to the other."

THIS is the second article of the series descriptive of Belgium industry written for THE IRON TRADE REVIEW *by its Paris correspondent, Francis Miltoun, who made an extensive trip through Belgium recently for the purpose of presenting an accurate word picture of the situation in the iron and steel trade. In this, as well as in the first article which appeared in* THE IRON TRADE REVIEW, *Aug.* 14, *Mr. Miltoun gives the results of a general survey of economic conditions affecting the industry. In subsequent articles he will deal specifically with the status of the leading iron and steel works, the problems with which they are contending and the extent of their success in attempting to re-establish themselves in the position they formerly occupied in the world's markets. The next article will describe the great Ougree-Marihaye Co.'s plants on the Meuse.*

This, in a nutshell, is the commercial aspect of the period of reconstruction of Belgium. "Contiguous commercial and economic problems" is something more than a phrase. Both French and Belgian iron and steel and coal and coke companies have their interests as often on one side of the frontier as on the other, and sometimes on both.

The great Ougree-Marihaye Co., with its plant on the Meuse has its mineral deposits on French territory, and if it was put to the necessity of paying an export tax on its own mineral brought from France there would indeed be a lack of "a happy commercial *entente*," to quote further the words of King Albert. This was just the point of view that was expressed to me by the director of the Ougree-Marihaye company

Another question which is potent with possibilities for the future prosperity of Belgium is the freedom of

the waterway of the Scheldt; otherwise, Belgium, being essentially a manufacturing country, will be tributary to contiguous ports rather than having its own. Antwerp bids fair to be the chief port of continental Europe while Zeebruge and Bruges, and a still more distant project at Ghent, will endow the country with deap-sea outlets such as no other country of a like area in all the world possesses. These are the grand lines of the renaissance of Belgium. Another suggestion is the possible conception of a triumvirate —France, Belgium and Luxemburg. The combination would have the heaviest possible weight in the metallurgical industry of the eastern hemisphere. It is doubtful if England, Germany and Spain combined could equal them, although in area and financial resources the latter would be triple that of the former. This union of three may have some argumentative justification, but France is not very keen for it, and neither is Belgium, although one or the other would be willing enough to incorporate Luxemburg separately. Doubtless the most that can be looked for here is a protective economic and commercial, rather than political, union. Free trade between Luxemburg and Belgium, with the attendant possibility of Luxemburg making use of Belgian ports as if they were her own, would prove of benefit to Belgium, and would in no way be detrimental to Franco-Belgian interests. It is evident that Belgium is bound to reconstruct its economic edifice on an entirely new base. Labor is the chief factor in industry, and labor in Belgium is today 25 per cent cheaper than it is in England, and perhaps proportionately cheaper than it is in France. Coal is the daily bread of industry. Belgium has both coal and labor in sufficient quantity and of excellent quality. If old methods have gone into bankruptcy because of new ideas evolved from the war this does not in the least affect the prime movers of industry—labor and combustibles. When we add to this, raw material in the shape of iron ore we have a formidable combination.

Belgium is well provided for. The surface of the whole fabric has crumpled like the rim of a volcano, but the mountain of energy is still there, and also, the will to do. This is the summing up of my impressions of 10 days spent among the shattered industries and institutions of Belgium, looking below the surface for a light unfogged by political issues.

Facts and figures are sometimes dull reading, but they at least give authenticity to one's observations, if they have been conscientiously compiled. The following figures summarize production as of May 30, 1913 and May 30, 1919. They are significant when one considers that as a result of hostilities coal extraction during the period of the fighting was reduced to less than one-half of what it was formerly, and that of the 60 blast furnaces in Belgium before the war but four were left intact by the invaders.

Tons	May, 1913	May, 1919
Coal	1,800,000	1,100,000
Coke	125,000	36,000
Cement	73,000	7,000
Pig iron	210,986	4,065
Steel	182,681	8
Semifinished material	127,975	3,431

Despite the wide differences in some instances, figures show an awakening of activities going back to primary sources, such as coal and coke. If pig iron makes a lamentable showing what else is to be expected with but four furnaces lighted?

Activity means prosperity, and if for Belgium this is only relative as yet, and it cannot be otherwise for many months, it is an incontrovertible sign of progress. This is shown by the following figures relating to trade between England and Belgium for February, March and April of the present year: 28,325,000, 70,265,000 and 109,450,000 francs respectively. Belgium is not likely to go backward, although as will be shown later, its situation at this moment does not appear brilliant. The *Monitor des Interets Materials,* a semi-official journal of Brussels, sets forth the following explanatory note cautioning against acceptation of figures which indicate that the Belgian metallurgical industry is already up to 25 per cent of its before-the-war production. It states that from 10 per cent to 12 per cent is a more accurate estimate. My own computations based on coke and pig iron as of May, 1913, and 1919 indicate 24 per cent for the former and 2 per cent for the latter, which gives an average of 13 per cent. The Belgian government is discussing the question of tariffs on ores which are brought into Belgium from Luxemburg. It is of prime importance that the free importation of raw material should continue. Work has been started on the reconstruction of the eight furnaces of the Halanby interests which were destroyed. The company has just acquired an ore mine sufficiently productive to keep the furnaces operating when rebuilt.

The Usines Metallurgiques du Hainault is actually producing the equivalent of that which left the plant at the latter end of 1913. Three blast furnaces are in operation, a Thomas furnace, a Martin furnace and a rolling mill for sheets at La Louvier. During the past month 12,000 tons of rails and profiles were produced, and 3500 tons of plates. The shops engaged in locomotive and rolling-stock

DURING THE WAR GERMANS ADVERTISED THEIR FACILITIES FOR SHIPPING PROPERTY STOLEN IN BELGIUM TO GERMANY

repairs for the Belgian railroads are operating at full capacity, and awaiting orders for a series of express locomotives from the government. The restitution by the Germans of pillaged and despoiled Belgian property will have not a little to do with the speed with which many Belgian manufacturers resume production. This process is slow, inasmuch as the Belgian restitution bureau at Wiesbaden is more or less dependent on the Germans making known the hiding places of the machinery stolen from Belgian factories. One hundred and twenty-two Belgian officials are traveling about Germany locating and arranging for the return of the machinery. In March, 1919, 108 tons were shipped back to Belgium and in June nearly 10,000 tons. Among other stolen articles recovered from Germany were two freight cars of Belgian postage stamps. They could hardly have been worth to Germany more than the value of old paper.

Arrête

1. L'exportation hors de Belgique de machines à travailler le métal est interdite. Tout essai d'exporter des machines de ce genre entraînera la confiscation de ces machines.

2. Exception est faite pour les machines qui sont exportees en Allemagne sur l'ordre du Gouvernement Général.

3. Cet arrêté entre aussitôt en vigueur.

Bruxelles, le 17 fevrier 1915.

Le Gouverneur Général en Belgique.
Baron von BISSING,
Colonel General.

Forbidden

1. The exporting from Belgium of metal working machines is prohibited. Any attempt to export machines of this kind will entail confiscation of these machines.

2. Exception is made of machines which are exported to Germany on the order of the governor general.

3. This prohibition will be rigorously enforced.

Brussells, Feb. 17, 1915.
The Governor General of Belgium,

BARON VON BISZING,
Colonel General.

EXPORTATION OF MACHINERY, EXCEPT TO GERMANY, WAS FORBIDDEN BY PROCLAMATION IN BELGIUM

Another sign of the progress which Belgium is making toward economic recovery is the increase in the figures relating to the operation of railroads. The accompanying map shows that the devastation of Belgium during the war was much more widespread than commonly supposed. After all transportation is the soul of modern industry, and it is a sure indication of the revival when it is considered that railroad passenger receipts were 9,504,000 francs in May, 1914, and 11,202,000 in May, 1919. Freight receipts decreased from 18,787,000 to 14,370,000, although the latter figure is quite a respectable showing, all circumstances considered.

The specific needs of Belgium may be enumerated as follows, the estimate being based upon figures and facts given me by the Office Central de Reconstruction. One can well judge of the importance of the destructions and requisitions made by the German authorities when they occupied the country from the figures representing restitutions already made, and also from the figures of the official Belgian archives showing requisition vouchers and evaluations, made by experts since the armistice, of damages to the value of 5,754,000,000 francs. These figures apply only to industry, and do not include personal property losses. The needs of Belgian industry in order that the wheels may again turn profitably are collated as follows:

Coal and Mining Industry: Has immediate need of all kinds of mining material, hemp, and especially steel, cables, which in most Belgian mines were lacking at the time of the German evacuation. Besides this, sorting machinery, motive power, trucks and hoisting machinery of all kinds are needed.

Coke Industry: Ovens operating by the recuperation process are in especial need of sulphuric acid for the manufacture of sulphate of ammonia for the recuperation of the valuable by-product, benzol, which otherwise would be lost.

Agglomerates and Briquettes: There is an immediate need for *braie,* bitumen and *goudron,* as binding materials for the making of compressed coal and coke dust, an important fuel in Belgium.

Iron Industry: The pig iron industry has been kept at the level in Belgium since the armistice by the destruction of 56 out of 60 furnaces during the war, but it is without question that many more would have been lighted had there been an ample supply of mineral which for the most part was received before the war from Lorraine and Briey. Economic and political relations with respect to the interchange of the iron of France and the coal of Belgium have not yet been worked out. It is this, as much as anything, which may be said to have held Belgian pig-iron production down to 4000 tons per month as compared with something over 200,000 tons before the war.

Steel Industry: The lack of production of blooms, billets and ingots for rolling into flats and shapes is due entirely to a lack of machinery in all departments, from converters to rolling mills and tube and wire drawers. It is the lack of machinery actually in place that counteracts other influences tending toward the general prosperity of the country.

Textile Industry: As with the metallurgical industry, both raw materials and shaping machinery are lacking.

Glass Industry: This might be revived immediately were it not for a lack of sulphate of soda, being awaited from abroad. The glass industry is one of Belgium's basic industries.

Leather Industry: There is a manifest shortage of hides and skins for current needs and for industrial leather goods, such as transmission belts which were largely produced before the war.

Paper Industry: This industry requires 45,000 tons of pulp wood for the year 1919, but above all, sulphate of soda, bleaching lime and other chemicals are needed.

Chemical Industry: In general, chemicals for industrial use are bound to be lacking for a long time. Belgium needs dyestuffs and the necessary machinery to produce them and other chemicals.

That Belgian industry is making as rapid headway as it is is due entirely to the characteristics and temperaments of the Belgians; that it is not making more rapid headway is due to various temporary conditions.

Some of the great iron and steel plants of Belgium, notably the Cockerill and the Ougree-Marihaye plants, are making progress slowly because the directors prefer to wait and sail under their own colors rather than be in the least tributary to German machine manufacturers who are already making offers to fit up these plants with German machinery, at a price. Even though the price be attractive, considering the low value of the mark, it is not the Belgian spirit to accept assistance from such a source. The metal workers of the Ougree-Marihaye and Cockerill plants which are located at Seraing have stopped work, demanding an 8-hour day and increase in their wages. These are the two large Belgian metal plants.

Defend Quality of American Steel

Members of Institute of Mining and Metallurgical Engineers Defend Quality of Domestic Product When it is Reported Americans Will Re-enter German Market— Nearly 1000 Attend Annual Convention

A MERE statement to the effect that a well-known American manufacturer intends to re-enter the German market for high-grade steel, presumably because a product of the desired quality cannot be obtained in this country, precipitated a lively discussion at the conclusion of the session on iron and steel held jointly by the American Institute of Mining and Metallurgical Engineers and the American Electrochemical society at the Congress hotel, Chicago, Tuesday, Sept. 23. A number of metallurgists immediately arose to the defense of domestic steel, stating that it is not necessary for American manufacturers to go into foreign markets to obtain a high quality product.

As stated in the last issue of THE IRON TRADE REVIEW, in which the opening sessions of the Chicago conventions were reviewed, the 120th annual meeting of the American Institute of Mining and Metallurgical Engineers opened Monday, Sept. 22, continuing through the week concurrently with the fifth national exposition of chemical industries and the annual meetings of four other societies. The exposition, briefly mentioned last week, proved to be one of the most comprehensive shows ever held and attracted unusual attention because of its intimate relation to the wartime growth of the chemical and allied industries, which, it is estimated, represent an investment of $1,000,000,000.

Many papers of interest to the manufacturers and consumers of iron and steel were presented in several sessions devoted exclusively to the production of these products. Throughout the technical sessions there was unmistakable evidence of the efforts constantly being made to improve the quality of steel.

Tuesday afternoon at the Congress hotel the institute jointly with the American Electrochemical society held the session on iron and steel which had been scheduled to take place on board the lake steamer returning from Gary. Joseph W. Richards, Lehigh university, South Bethlehem, Pa., presided as chairman. A paper entitled "Blast Furnace Refractories" was read by Raymond M. Howe, Mellon Institute of Industrial Research, Pittsburgh. Mr. Howe emphasized the need for closer study and better co-ordination of effort on the part of the manufacturers and consumers of refractories. He cited several instances where careful sampling of clay increased the refractoriness of the finished product to the extent of 100 degrees Fahr. Proportioning, he said, is a problem that each plant must solve for itself as certain plastic clays bind with flint clays more readily than others. The characteristics of a fire brick depends very largely on the amount of water used in its manufacture. The amount of water to be used in making dense or porous brick varies not only with each individual mix but also with each process of manufacture.

The paper entitled "Effervescing Steel" by Henry D. Hibbard, consulting engineer, Plainfield, N. J., and one entitled "Aircraft Steel," by Alfred Sauveur, Harvard university, Cambridge, Mass., were read by title but were not discussed. J. R. Cain, United States Bureau of Standards, Washington, presented a paper on "Determining Gases in Steel and the Deoxidation of Steel." He claims that despite previous researches, no analytical methods are in use today in steel works for determining the gaseous constituents of steel. He gave a complete resume of the work done on this subject in the past, stated the scope of the investigations now being carried on by the bureau of standards, outlined what is to be accomplished by these investigations and described the results already attained. Mr. Cain's paper provided the basis for a very interesting discussion in which many metallurgists participated. J. S. Unger, Central Research bureau, Pittsburgh, stated that he believes it is more important to study the effect gases have on steel than to identify the gases. When such effects have been found, then the best methods for analysis should be studied. T. D. Yensen, Westinghouse Research Laboratories, Pittsburgh, suggested that a higher degree of accuracy be obtained in gas analysis. He pointed out that an error of one thousand of one per cent makes a vast difference.

A paper entitled "Effect of Time and Low Temperature on Physical Properties of Medium-Carbon Steel," by G. A. Reinhardt and H. L. Cutler, Youngstown Sheet & Tube Co., Youngstown, was read by Walter N. Crafts, British Forgings, Ltd., Toronto, Ont. This paper, which was presented almost in full in the Aug. 7 issue of THE IRON TRADE REVIEW, was widely discussed. The author's statements relating to the seasoning of steel brought forth considerable confirming evidence from those who had had similar experiences.

At the conclusion of the Tuesday session on iron and steel a lively discussion ensued when it was suggested that American manufacturers will have to go to Germany again to obtain quality steel for tools, springs and fine machinery. The statement aroused considerable indignation among the members, who declared emphatically that quality steel now is being made in this country and that through the experimental work conducted at the Carnegie School of Technology in cooperation with the United States bureau of standards, American steel will lead the world.

Bradley Stoughton stated that he recalled the statement made by the chairman of the board of directors of an important manufacturing concern to the effect that his company before the war had bought all of its quality steel in Germany and that now the war is over, it will go to Germany again for that product. C. F. W. Rys, chief metallurgist of the Carnegie Steel Co.; J. A. Mathews, president of the Halcomb Steel Co.; and G. K. Burgess,

chief metallurgist, United States bureau of standards, opposed the statement.

"There is no necessity for this manufacturer or anyone else to go into the German market for steel to be used in any sort of manufacturing in this country," said Mr. Rys. "American steelmakers are putting out steel suitable for the finest instruments and machinery. It is due to the American market to patronize local manufacturers."

The charge that improvements in steel manufacture is not progressing in this country because the Carnegie School of Technology and the United States bureau of mines are working at cross purposes was denied vigorously by Mr. Burgess.

The joint session with the Electrochemical society convened again in the Congress hotel at 8 p. m., Tuesday. Robert W. Hunt, Robert W. Hunt & Co., Chicago, presented a paper entitled "The Manufacture of Steel Rails." Mr. Hunt gave a brief history of the early work pertaining to the manufacture of rails and very carefully outlined a system of inspection adopted by him in 1912 which thoroughly supervises the progressive steps of the manufacture of rails.

The remainder of Mr. Hunt's paper is devoted to the author's ideas regarding certain features of the manufacture of rails and is abstracted elsewhere on this page.

C. L. Huston described the 204-inch plate mill installed in the plant of the Lukens Iron & Steel Co., Coatesville, Pa. Mr. Huston's talk was accompanied by moving pictures, showing the plate mill in operation.

Theodore W. Robinson, Chicago, spoke on the industries of the Chicago district, pointing out that from an unknown fringe of pioneer humanity to the fifth city of the world, is Chicago's achievement in a little more than a generation. He urged the members of the institute to spread the gospel of hard-work, thrift and loyalty. Commenting upon the present unrest, he said: "How vitally necessary is such action is demonstrated by the wide and nationally momentous strike that has been inaugurated against the United States Steel corporation and other interests."

The last iron and steel session, with John A. Mathews, president of the Halcomb Steel Co. presiding, was held at 10 a. m. Wednesday. N. B. Pilling abstracted his paper entitled "Cooling Properties of Technical Quenching Liquids." He stated that the temperature of the liquid bath in which steel is quenched has a decided influence on the speed of cooling in the case of some liquids and very little in the case of others. Widely different physical results have been obtained by the use of water spray, water immersion and oil immersion and further experiment has shown that the quenching effect of water used as a spray or an immersion varies greatly with the temperature of the water. A discussion of the paper was entered into largely by Harrison E. Howe, Washington.

The papers entitled "Differential Crystallization in Cast-Steel Runner," by F. B. Foley, which was published in the July 3 issue of THE IRON TRADE REVIEW; "Oxygen in Cast Iron and its Application," by W. L. Stork; "Deep Etching of Rails and Forgings," by F. M. Waring and K. E. Hofammann; "Graphitization of White Cast Iron upon Annealing," by P. D. Merica and L. J. Gurevich; and "Experimental Data Obtained on Charpy Impact Machine," by F. C. Langenberg, were presented by title only.

The latter paper was discussed at length by Capt. A. G. Zimmermann. It was brought out by Mr. Zimmermann that a method has been developed at the Watertown arsenal whereby the results of an impact test are expressed in pounds per square inch instead of in foot-pounds. He is of the opinion that results expressed in pounds per square inch should be generally adopted.

H. J. French, United States bureau of standards, Washington, next presented an unusually comprehensive paper entitled "Manufacture and Properties of Light-Wall Structural Tubing." He stated that, as far as he knew, no entirely satisfactory method is now in use in America for heat treating long-length pipe. In the discussion which ensued it was stated that long-length pipe was being annealed in electric heat treating furnaces but with this method croppage at one end is necessary.

The final paper presented was entitled "Heat Treatment of Cast Steel," by John H. Hall, Arvid E. Nissen and Knox Taylor, Taylor-Wharton Iron & Steel Co., High Bridge, N. J. The paper was verbally abstracted by Mr. Hall and discussed at length by Henry M. Howe, Bedford Mills, N. Y.

Wednesday afternoon's session on pyrometry, which was held in cooperation with the national research council and the United States bureau of standards, referred especially to iron and steel metallurgy.

Notes on Manufacture of Steel Rails

BY ROBERT W. HUNT

AS EACH ingot is a separate and individual casting, I believe that, in addition to the tests representing the whole heat of metal, there should be some way of determining the physical character of the rails rolled from each and every ingot. As a destructive test seems to be the only way to actually ascertain that point, and as, of course, you cannot destroy all the rails, I installed in 1915, what is known as the nick-and-break test, under which a test piece is cut from the top end of the first, or *A*, rail rolled from each ingot. This is nicked and broken, thus enabling the inspector to examine the fractures and, in case of the presence of segregation, pipe, or some other mechanical defect, to reject the rail represented by the test piece. Following such rejection, a test piece shall be cut from the bottom end of the same rail and broken; if that piece has similar defects, the second, or *B*, rail is rejected, and a piece cut from its lower end, and tested. In case of failure, the procedure is continued for the succeeding rails until a sound one has been reached. This has proved an expeditious and cheap procedure.

As the chemical composition of the steel is a fundamental part of rail specifications, a very important point is the taking, for analysis, of the drilling representing the heats of steel from which the rails are rolled. The drillings must be taken from test ingots, and the time and manner of casting these ingots, as well as their shape, is receiving attention. In fact, the whole matter of ladle-test ingots is now receiving the attention and study of a committee of the American Society for Testing Materials in conjunction with the United States bureau of standards. Pending a full report on the subject by them, it would appear desirable to require the adoption of a standard sized and shaped ladle-test ingot and to insist that it be cast as sound as possible by the addition of aluminum to the

From a paper presented at the annual meeting of the American Institute of Mining and Metallurgical Engineers.

molten steel; further, that two or three should be cast at equal intervals in a heat during the pouring of the large ingots and drillings from them carefully mixed. Thus, greater protection would be afforded as against a single small test ingot not representing, thoroughly, say, a 100-ton heat of steel.

Another point of less importance, but still of prime necessity, is the milling of both ends of the rails. This has been the practice of English mills for years and some American makers mill one end of some of the rails made by them. Depending on chipping and filing for the finishing of the ends of the rails is very unsatisfactory. Milling would not only eliminate all fins resulting from the hot sawing, but positively assure squareness of ends and accuracy of lengths, all three of which are of great importance in relation to joints, a part of track maintenance that is receiving more and more attention.

Much thought and considerable experiment have been given to the betterment of the cold straightening of rails. From the time of that procedure being represented by the blows of a heavy sledge swung by a sturdy man, the practice has been a brutal one. To accomplish the semblance of the desired result, the steel has to be bent beyond its elastic limit, thus establishing strains with an ever present danger of causing actual or incipient ruptures in the metal, which may result in complete rail failures. In my judgment, it is practical to do away with cold straightening, by proper hot straightening of the rails. If, in case of uncontrollable conditions, a few rails should come from the hot beds unsuitable for use, they could, after some straightening, be classed as seconds and used for other than main track purposes.

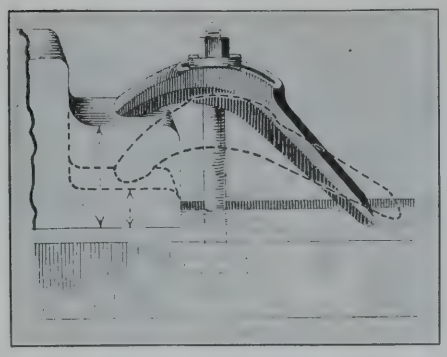
In the present practice, a rail is put under the cold press and most carefully, but brutally, punched into seeming straight line and surface. Frequently, it is later put on the ties and with equal care spiked out of a straight line into curves of varying degrees. Rails can be hot straightened without any short kinks and with lines that will permit good loading for transportation and satisfactory track laying; thus can the expense and danger of the cold straightening be avoided. There are now at least a thousand tons of rails, finished as above advocated, giving satisfactory service in the lines of several railroads having heavy traffic, and they have had over three years of trial. The rail makers will welcome such a departure from present practice and, I am confident, make it successful.

To secure sound rails it is of supreme importance to make sound ingots. Sir Robert Hadfield, in October, 1912, presented a paper before the Iron and Steel institute which attracted wide attention and much discussion. The plan is broadly designated as using a "hot-top ingot," and many plans of obtaining such castings, other than directly following Sir Robert's, have been and are being successfully employed, notably, on ingots to be used in ordnance work. As yet hot-top ingots are not used in rail making; both encouraging and disappointing experiments have been made, but I am satisfied that it is practical and will be so proved. Based on the results obtained with other than rail ingots, its success with them is bound to come. Therefore, while I am not at this time prepared to incorporate hot-top ingots in rail specifications, the time is near when it will be entirely practical to do so. It may involve a somewhat greater first cost, to be at least partly offset by saving in scrap, but if the outlay is justified when making steel to be used in destroying life, should it not be even more so when producing metal on the soundness of which human safety will so largely depend?

Avoiding Brittleness

The most harmful physical characteristic of rail steel is, of course, brittleness. The low amount of phosphorus present in open-hearth steel renders protection against the dangers from that element and permits freer use of carbon as a hardening element. Experience has pretty well demonstrated that the safe upper limit for carbon in rail steel is approximately 0.75 per cent; and accepted practice has allowed a working range of 13 points, with the result that the lower limit of carbon has been most frequently specified as 0.59 per cent, but in some cases 0.62 or 0.63 per cent; speaking, of course, of the almost universally accepted practice of having the steel contain not over 0.04 per cent phosphorus. The problem of always making basic open-hearth steel within this range is difficult and frequently heats are cast slightly outside the limits specified. There is a much greater commercial opportunity for manufacturers to find other than rail uses for steel containing the lower amounts of carbon than when containing the higher amounts; therefore, they naturally aim to have the carbon content nearer the low side of the permitted range. Hence, the larger percentage of heats is on the low side of the allowed carbon. In repeated cases, "off heats" are produced which fail to be within the prescribed limits of the particular specification to which the rails are being rolled, but are entirely applicable to another rail specification for which the mill has orders. This leads to the ingots from such heats being temporarily discarded, later to be reheated and rolled on the other specification. This means reheating and rolling of cold ingots, which is invariably accompanied by an increased production of second-quality rails, largely augmented by the lack of proper control and treatment in the soaking pits.

The various railway systems of the country are now using as their standard practice about the same weight of rails. There are some variations of sections, but I do not see any serious objection to the adoption of a general or common chemical specification. We know that hundreths of percentages are very delicate variations and, especially in relation to carbon, errors may occur in the results obtained by two different chemists, particularly if working under modern manufacturing pressure. If a common carbon, silicon, manganese, and phosphorus specification prevailed, the work of the open-hearth steel melter would be simplified, the cold-ingot trouble eliminated, and, I think, better general results obtained.



As a means of lessening the tendency on the part of the manufacturers to protect themselves by keeping the carbon content of the metal toward the lower range, it would be well to accept not over an agreed upon small per cent of heats slightly higher in carbon than the specifications. These rails could be specially marked and shipped, so that the roads would have them by themselves and use them in places for which they would be well adapted. I think that there would be but a very small percentage of such rails produced, but the very fact that the danger of rejection from over high carbon would be eliminated would cause the steel makers to feel less restricted in their procedure. In other words, it would allow a certain elasticity which would, undoubtedly, work to the advantage of both producers and consumers; of coure, for acceptance, the high-carbon steel must have successfully passed the prescribed physical tests.

Another development of great interest is the triplex processes, both on the bessemer open-hearth electric and the bessemer and double open-hearth plans. These are being worked out in practice and, I believe, will soon be adding much toward the production of more regular and, hence, better steel and better rails.

Machine Clamp Eliminates Tool Blocks

A clamp for firmly holding work on planers, boring mills, drill presses, face plates of lathes, milling machines and for holding down press bolsters and fixtures was brought out recently by Albert O. Mathison, New Britain, Conn. It may be used on the side of the work, leaving the top surface free for machining or it may be used as an inexpensive planer vise.

If the work is out of square or tapered, the clamp will adjust itself to all angles. When the clamp is used on the side of the work, as shown in the accompanying illustration, a cut equal to the capacity of the machine may be taken without the work slipping, it is said. The clamp is 8 inches long, 1½ inches thick and is equipped with a ¾-inch slot. The clamp, which is drop forged and hardened, weighs 3½ pounds.

THIS CLAMP MAY BE USED IN MANY DIFFERENT POSITIONS

New Grinding Machine is Semiautomatic

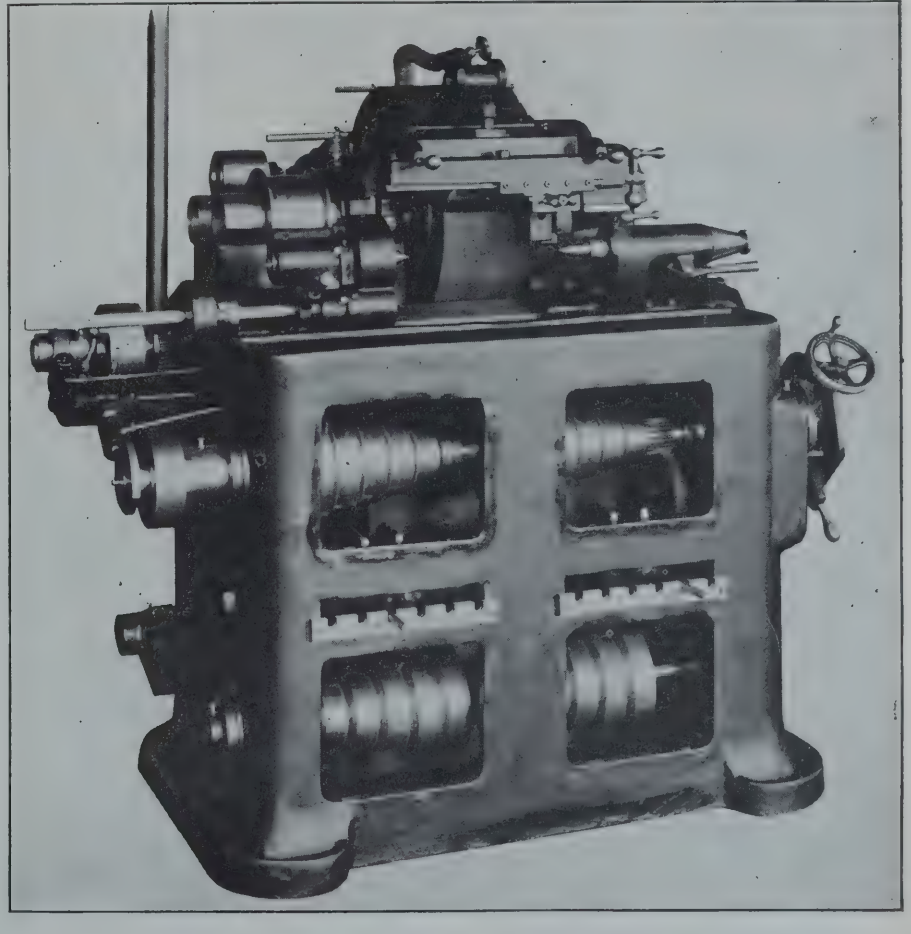
A new semiautomatic wide-wheel grinding machine recently was designed by the Woods Engineering Co., Alliance, O. The work has a straight in and a straight out movement with a slight movement lengthwise during the grinding period.

The machine, which weighs 6000 pounds and occupies a floor space of 6x6 feet, has a grinding wheel of 8 inches face and 20 inches maximum diameter. Work 15 inches long and 10 inches in diameter can be handled between the centers. The head and tail stocks are mounted on a square shaft having clamped to it an arm which carries the mechanism for making the diameter adjustments in grinding. This arm is shown at the right side of the machine in the accompanying illustration. A shaft running through the housing parallel to the square shaft carries on the right-hand end a cam that controls the movement of the work to the grinding wheel. This cam shaft has six speeds.

At the left-hand end of the cam shaft is a cam that controls the clutch pulley driving the work. These two cams are timed so that as the work moves up to the grinding wheel, the clutch pulley is engaged and the work starts rotating just before it makes contact with the grinding wheel. When the grinding cycle is completed, the work moves away from the wheel, and stops rotating to be reloaded. The grinding wheel head swivels on a stud for grinding taper work.

For truing the grinding wheel a frame is pivoted on the casting which forms the wheel guard. This frame carries a dovetail slide arranged to a swivel and a carriage with a cross feed movement carries the diamond holders. In operation the work centers are lowered by removing the hardened pin that bears on the cam, swinging the truing frame down to a positive stop and bringing the diamond on the same plane as the work contact. The machine is entirely self contained even to being equipped with a crane for handling the spindle when changing wheels.

Training Foremen to Lead



(*Continued from Page* 895)

pathetic attitude toward workmen, saying:

"The workman demands more liberty in industry, a share in the policies of management so far as they touch his interests. In so doing he rarely adopts any one of the schemes of social reconstruction which are pressed upon his attention today, nor does he mean to dispense with or overrule the superior ability, knowledge and experience admittedly necessary in the general conduct of a plant by its managers and owners. There are schemes which propose to lay violent hands on all capital with no adequate care for skilled direction, but the workman's desire is for a change in the spirit of industry, and that change is being welcomed by all thoughtful owners and executives."

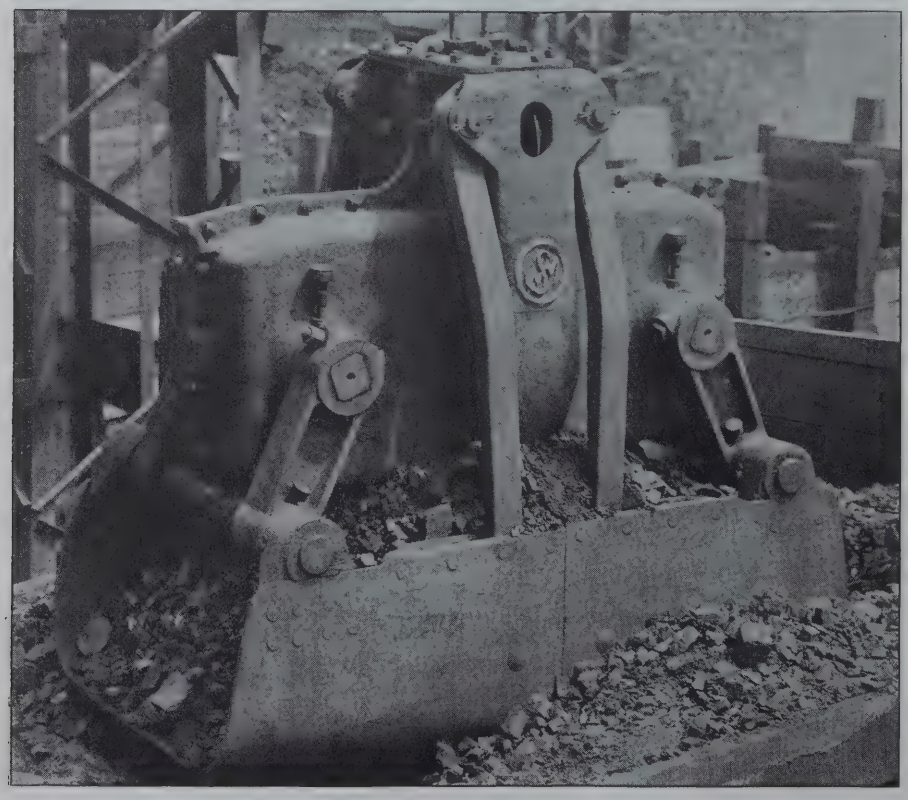
He says the question of what labor wants was studied in all the classes of foremen with which he was identified, and it was concluded that a workman will be contented as a rule if he obtains:

Security of employment, a voice in fixing employment conditions, a fair share of the profits, working hours yielding reasonable leisure, prevention of profiteering, suitable housing and welfare provision, economic instruction and opportunity to rise. The

THIS MACHINE REQUIRES ONLY LOADING AND UNLOADING. GRINDING IS AUTOMATIC

contented workman will co-operate if there is: Elimination of all suspicion of his employer, creation of confidence between him and executives, recognition of mutual interests in industry, creation of machinery for facilitating acquaintance and an absence of all paternalism in industrial relations.

Bucket Has Working Parts Completely Enclosed

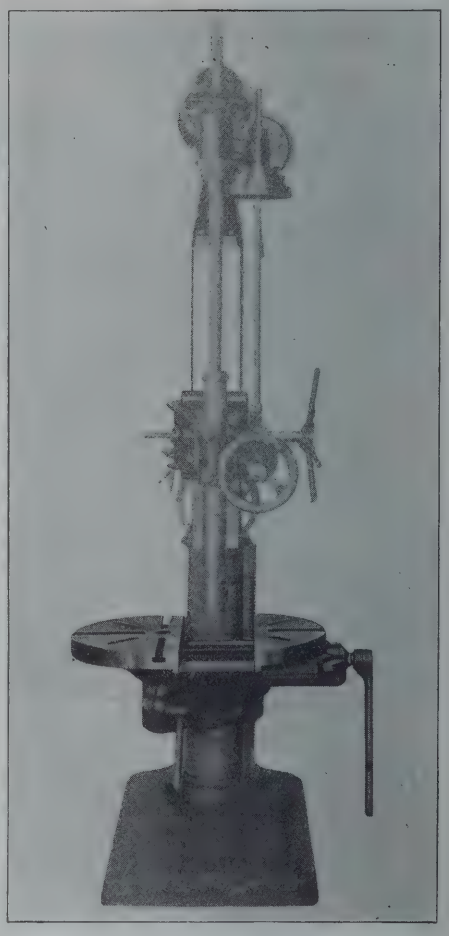


The Wellman-Seaver-Morgan Co., Cleveland, has developed a clam-shell bucket which has all the working parts completely enclosed in a tight casing where they are constantly lubricated and where they do not come in contact with the material the bucket is handling. The bucket is composed of a comparatively small number of parts, so arranged as to facilitate the removal of any part in case of necessary repairs. This bucket is especially designed for handling coal, sand, gravel and cinders. It is operated by two ropes and, consequently, can be handled by practically any type of two-drum hoist.

The bucket has enclosed gearing to produce the necessary digging power. The power casing, which forms the main frame of the bucket, and from which the shells are suspended, is divided in a vertical plane through its longitudinal center-line. These two sections are bolted together to form two tight compartments, which enclose the operating gears, and a third compartment in the center for the power wheel and the deflecting sheaves for the operating ropes.

The power-wheel center is integral with the two bevel pinions which extend into the gear compartments and mesh with the operating segments. These segments are keyed to the operating shafts which are supported in bearings cast in the casings. The outer end of the operating shafts are finished square and support the rear bucket arms which are connected to the shell shafts. The cutting edges of the shells are pin connected to the side bars. The latter are suspended from lugs cast in the top part of the casing.

The shells are open at the back to prevent compression of the material when the bucket is closing. The rigid connection of the rear arms to the operating shafts and to the shell shafts insures positive alignment of the shells; and side lash is further prevented by side-bar guides attached to the shells. As the operating gears are completely enclosed by the casing, it is impossible for them to come in contact with the material being handled.



The opening of the bucket is effected by an opening rope attached to the small section of the power wheel, and wound in the opposite direction from the closing rope.

CLAM-SHELL BUCKET BUILT WITH ENCLOSED GEARING WHICH OPERATES IN OIL

Designs Platen Vise

In drilling and reaming a number of machine parts, means for clamping the work on the drill press platen must frequently be provided. This procedure involves hunting up bolts and straps to say nothing of the time consumed in locating the pieces in position for the machining operation. The device shown in the accompanying illustration recently was designed by the Sprague-Hayes Mfg. Co., Detroit, to furnish a ready means for holding work on the drill press for drilling and reaming.

THIS DRILL PRESS PLATEN IS EQUIPPED WITH JAWS FOR LOCATING THE WORK TO BE MACHINED

The device in general design resembles a milling machine vise with the difference that the top is circular and finished like a drill press platen. The back jaw is stationary while the front jaw is actuated by means of a substantial square-threaded screw. The jaws that hold the work are case hardened to protect them from undue wear and finished by grinding to insure accuracy. Special jaws for holding odd-shaped pieces can readily be substituted for the plain jaws as in ordinary milling machine practice.

As the device can be rotated on its center and swung in an arc under the drill press spindle, the work is readily centered after the method used in ordinary drill press practice. When the jaws are closed together the device forms an ordinary drill press platen and work can be clamped to it in the usual way if desired.

Exhibits Show Year's Progress

Foundry and Machine Exhibition Replete With Working Displays of New Devices Designed to Meet Labor Shortage and Reduce Costs—Foreign Equipment Exhibited — Molding-Machine Displays Complete

THAT the strain of high pressure production, felt by the manufacturers of the United States while making their unprecedented and successful attempt to meet the demands of war, did not retard to any appreciable extent their desire or ability to create new and better machine shop and foundry equipment was amply demonstrated at the fourteenth annual exhibition of the American Foundrymen's association, which opened Monday, Sept. 29 at the Philadelphia Commercial Museum. Proof that engineers have taken full advantage of the cessation of hostilities to engage in experimental work and to further develop labor-saving machines, was provided in many of the exhibits of molding machines, sand-blasting equipment, and metal and wood-working machinery.

The association was particularly fortunate this year in securing a hall in which all of the exhibits could be assembled in one room. This feature more than compensated for the slight inconvenience involved in reaching the exhibition from the hotel where the meetings were held.

One of the most noteworthy machines displayed by the manufacturers of molding equipment was a device for producing tractor transmission housings in green sand designed and patented by J. T. Stoney, foundry superintendent of the Ferro Foundry & Machine Co., Cleveland. A detailed account of the manner in which this equipment is operated appeared in the Sept. 18 issue of THE IRON TRADE REVIEW. Other new equipment included a combination split-pattern machine display by the Mumford Molding Machine Co., a jarring stripping-plate machine exhibited by the Tabor Mfg. Co., and a machine of the jar-ram type shown by the Cleveland-Osborn Mfg. Co., Cleveland.

The exhibit of Henry E. Pridmore, Chicago, included seven molding machines ranging in size from a 10 x 12-inch stand machine to a 36 x 48-inch electric jolt-stripping machine.

An unusually complete line of molding machines was displayed by the Tabor Mfg. Co., Philadelphia. Molds for a large tractor motor crank-case were made on a 9-inch jar roll-over pattern-drawing machine.

The exhibit of the Federal Foundry Supply Co., Cleveland, in addition to the machine made by the Ferro Foundry & Machine Co., previously mentioned, included portable and stationary combination jar and squeezing machines, plain squeezers, air and electrically operated vibrators, snap flasks, and an agricultural tractor driven by a 2½-horsepower engine.

The Champion Foundry & Machine

At Work Today

IN THE midst of today's upheavals, it is becoming constantly more patent that the crying need of the hour is increased production of commodities of every kind and the orderly and just distribution of those commodities so they may serve the convenience and comfort of mankind. From this imperative task the workers of the world are temporarily turning away. But one great body of men—the engineers, inventors, designers and constructors of labor-saving equipment—are bending more rigorously to their tasks than even during the war. Their efforts stand forth in refreshing contrast. This is evident from even a cursory survey of the great interallied foundry and machine exhibition in progress in Philadelphia this week. On every hand are new devices and equipment designed to lessen manual effort, speed-up production and cut costs. Who may say but that herein lies potent aid in our present distress?

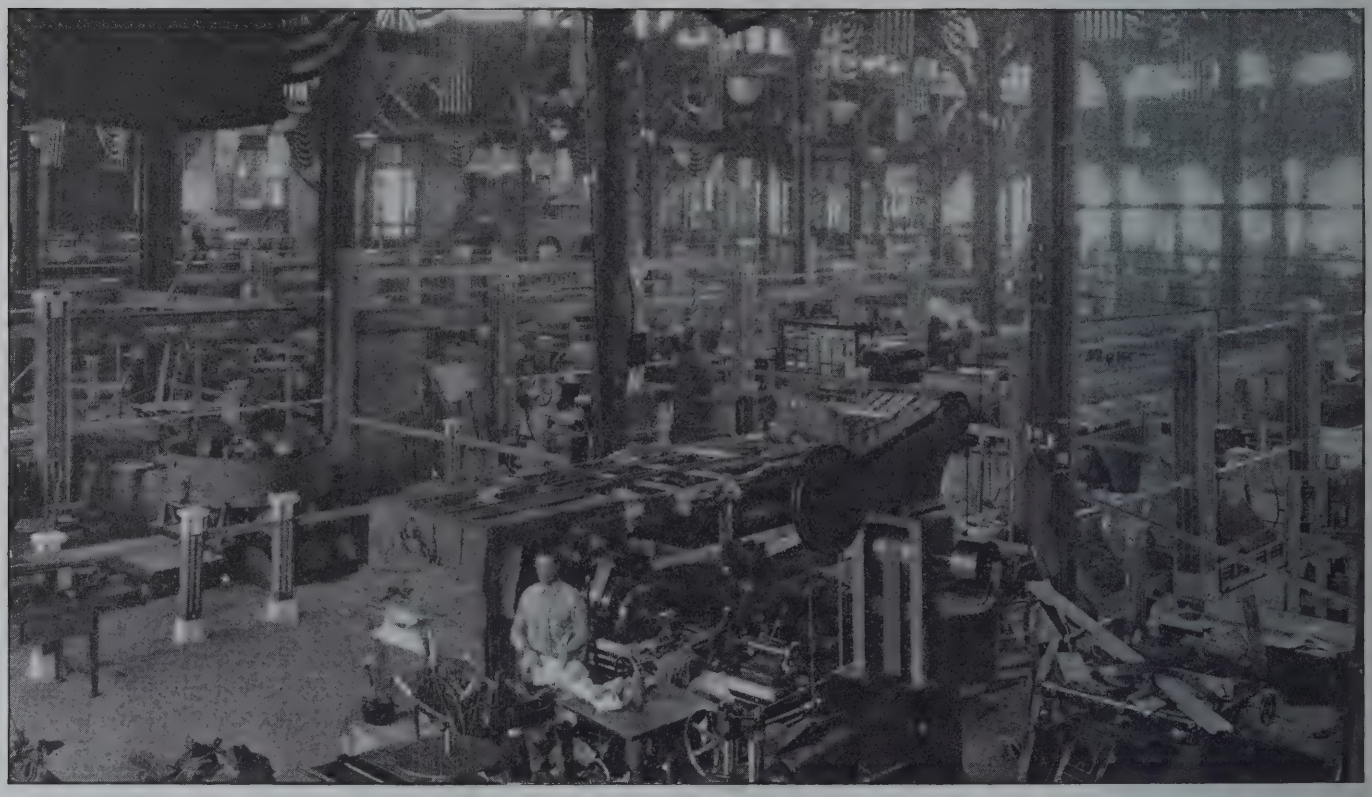
TWO DAYS BEFORE THE HOUR SET FOR OPENING, THE 1919 FOUNDRY AND MACHINE EXHIBITION WAS NEARLY COMPLETE

Co., Chicago, demonstrated a 16-inch jolt roll-over machine fitted with a pattern and operated as a molding machine and a similar machine fitted with a core box and operated as a core-making machine. A new jolt-squeezer type machine in which an internal cylinder performs the jolt and a 12-inch cylinder causes the squeezing was demonstrated by the Berkshire Mfg. Co. Cleveland.

The E. J. Woodison Co., Detroit, had an extensive display of molding machines. The Mumford Molding Machine Co., Chicago, exhibited a new combination jolt split-pattern molding machine equipped with a automatic slow starting pattern-draft cylinder operated by oil and controlled by a knee valve. The Herman Pneumatic Machine Co., Pittsburgh, displayed a plain jarring machine with the table plate off of base to show the construction of the machine. A new jolt roll-over machine and a small hand roll-over machine were shown by the Grimes Molding Machine Co., Detroit. The Davenport Machine & Foundry Co., Davenport, Iowa, exhibited a combination jolt roll-over pattern-drawing machine, a 30 x 30-inch jolt stripper and a jolt squeezer.

The Arcade Mfg. Co., Freeport, Ill., exhibited a plain air operated squeezer, a combined jolt and squeezer, other molding machines of hand and air operated types, four core-making machines, and a pouring device. Various types of molding machines also were displayed and operated by the Buch Foundry Equipment Co., York, Pa.; the International Molding Machine Co., Chicago; and the United States Molding Machine Co., Cleveland.

The Foundry Appliance Co., Newark, N. J., demonstrated a cope handling device on a squeezer type molding machine. As the piston moves upward the cope is clamped against the head of the machine by flask hooks. On the down stroke of the piston, the pattern is drawn from the cope and drag. The plate is removed and the mold closed by lowering the cope on the drag. Taper snap molding flasks and automatic snap flasks were demonstrated on a power squeezer machine by the T. B. Wood's Sons Co., Chambersburg, Pa.



Machine Tool Exhibits Set Record

In number of tools displayed and in the diversity of work actually performed during the week, this year's exhibition of metal and woodworking machinery surpassed any previous foundry show and undoubtedly equaled any exposition of its kind ever held in this country. The effort of engineers to design equipment calculated to conserve manpower was reflected more noticeably in the display of machine tools than in the exhibits of any other branch of industry represented. The tendency to equip machines with direct or gear connected motor drive was never more strongly emphasized and the growing popularity of remote control for electric motors was apparent.

The products of seven machine tool manufacturers were displayed and demonstrated in the spacious booth of the Vandyck-Churchill Co., Philadelphia. Among the metalworking tools shown in this exhibit are those of the American Tool Works Co., Cincinnati. An 18-spindle multiple drill made by Edwin Harrington Son & Co., also was demonstrated in this booth and screw chains manufactured by the same company were displayed.

A milling machine manufactured by the Kempsmith Mfg. Co., Milwaukee, was demonstrated in the Vandyck-Churchill booth, two 8-inch stellite cutters with 1⅜-inch face working on a high carbon steel casting.

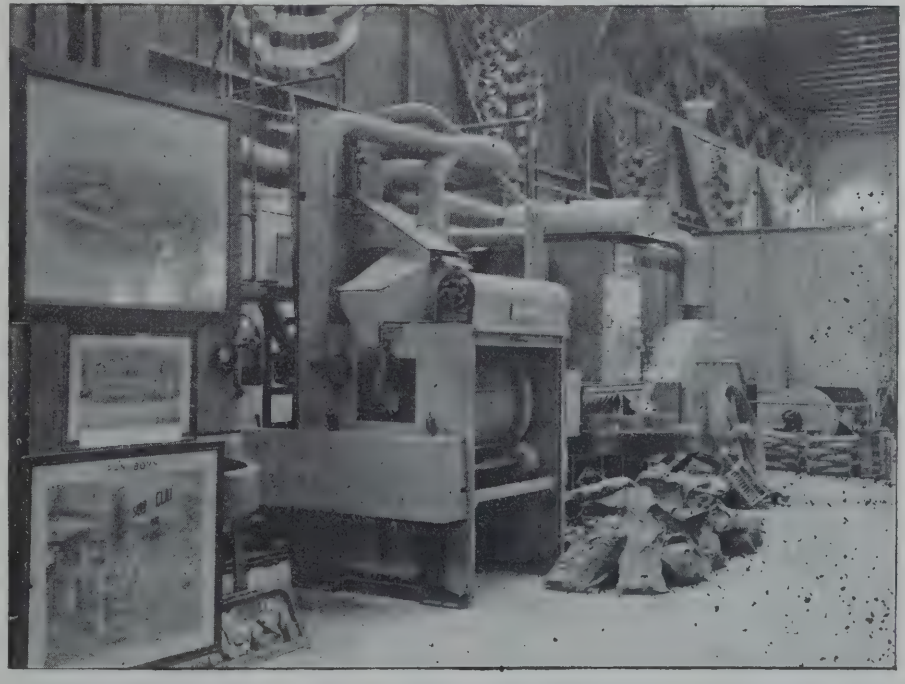
Machines representing seven different manufacturers were shown by the Monarch Machinery Co., Philadelphia. Among the tools exhibited were a heavy-duty 3-inch drill made by the Minster Machine Co., Minster, O.; a 26-inch drill press manufactured by the Weigel Machine Tool Co., Peru, Ind.; a plain milling machine built by the Rockford Milling Machine Co., Rockford, Ill.; a manufacturing miller, the product of Gooley & Edlund, Inc., Cortland, N. Y.; a 32-inch shaper made by the Cincinnati Shaper Co., Cincinnati; a 2-spindle sensitive drill manufactured by the Edlund Corp.,

THE SHOW THIS YEAR IS UNUSUALLY REPLETE WITH MACHINERY AND MACHINE-TOOL EXHIBITS DISPLAYED UNDER WORKING CONDITIONS

SOME OF THE EXHIBITS OF FOUNDRY SUPPLIES, METALS AND MACHINE TOOLS

Cortland, N. Y.; a geared-head lathe made by the Monarch Machinery Co., Sydney, O.; a 14-inch tool room lathe and a 10-inch manufacturing lathe, the products of the Rockford Tool Co., Rockford, Ill.; a 9-inch lathe made by the Dalton Machine Co., Inc., New York; and a cutter and reamer grinder, a surface grinder and a drill grinder made by the Wilmarth & Mormon Co., Grand Rapids, Mich. Machine tools made by four manufacturers comprised the exhibit of the Swind Machinery Co., Philadelphia.

Albert Herbert, Ltd., New York, and Coventry, Eng., demonstrated a British-made combination turret lathe working on 3-step cone pulley castings; a hexagon turret lathe operating on a 3-diameter bolt; a grinder working on high speed steel lathe, planer and shaper tools, finishing them from bar stock without forging; and concentric chucks.



The Heald Machine Co., Worcester, Mass., exhibited two internal grinders, one of which has never been displayed before; an 8-inch rotary surface grinder; a cylinder grinder; and magnetic chucks. The Bullard Machine Tool Co., Bridgeport, Conn., showed a multiple milling machine with six heads operating on bevel gear blanks. The Cincinnati Pulley Machinery Co., Cincinnati, demonstrated sensitive drills and drills with built-in tapping attachments.

The exhibits of wood and pattern-making machinery were unusually complete. The American Wood Working Machinery Co., Rochester, N. Y., displayed a 16-inch motor driven jointer, a 36-inch band saw, and combination disk and spindle sanding machine, a motor driven 4-inch bench planer and a single surfacer. Charles H. Besley & Co., Chicago, exhibited two metal working grinders, a patternmakers combination grinder, a 30-inch ringed wheel grinder, two disk grinders and abrasive disks. The Gardner Machine Co., Beloit, Wis., and others, showed a variety of equipment.

Pointers on Plant Design

In times past any sort of structure has been deemed entirely suitable for a foundry, but the handicap of poorly designed buildings and equipment is now generally recognized. This change of viewpoint, marking as it does the passing of another phase of hit-or-miss manufacturing methods, is emphasized by the growing class of construction engineers who design buildings for exclusive foundry purposes. The Philadelphia show was featured by a number of interesting exhibits by this class of experts. Frank D. Chase, Inc., Chicago, showed a large number of photographs accompanied by descriptive matter covering foundry construction of a modern character. The Clement A. Hardy Co., Chicago, presented some exceedingly interesting photographs of foundries constructed or now being built in various parts of the country. The Austin Co., Cleveland, had a number of models, drawings and photographs accompanied by literature covering the class of service which this concern has given and offers in the special field of foundry erection. The H. M. Lane Co., Detroit, also offered examples of this class of work.

Construction problems immediately suggest a thousand details of arrangement and handling facilities, without which the most perfectly designed plant would be inefficient. Handling materials in casting plants is a specialized field and as such is recognized by a number of representative manufacturers who build to meet the needs of the times. Obviously it was impracticable to show full size cranes with craneways proportionate to modern foundry needs, but the crane and hoist manufacturers utilized novel expedients to exhibit their products

AN UNUSUALLY COMPLETE DISPLAY OF CLEANING-ROOM EQUIPMENT WAS SHOWN BY THE PANGBORN CORP.

to the best advantage. The **Shepard** Electric Crane & Hoist Co., Montour Falls, N. Y., showed a special abbreviated structure upon which was mounted a standard crane trolley operated by controllers placed on the floor nearby. The same frame served to support a cage-operated hoist with electric magnet, two standard types of floor operated hoists, and a new type of electric cargo winch. The latter consists of a case base upon which is mounted a back-geared motor with a special drum and winch head. The head is arranged so that a load may be held stationary while the boom is raised, lowered or swung around independently by motor power.

Exhibits a Full Sized Section

The Cheseapeake Iron Works, Baltimore, exhibited a section of a full sized craneway supported upon an exceptionally well built steel frame which demonstrates the character of other steel structures which this company constructs. Photographs served to set forth the variety of this latter class of work. The Whiting Foundry Equipment Co., Harvey, Ill., featured an operating model of a crane trolley in addition to a diversified list of foundry equipment which included a round steel plate tumbling barrel, a 2-ton charging car, a 2-ton worm geared crane ladle and photographs and drawings of the application of machinery which is in successful use.

The pneumatic hoist manufacturers were liberally represented. The Chicago Pneumatic Tool Co., Chicago, exhibited pneumatic geared and cylinder hoists in addition to its line of chipping and riveting hammers, drills, grinders, rammers, and a 14 x 9 x 14-inch air compressor. The Ingersoll-Rand Co., New York, had on exhibition motor hoists, grinders, rammers, and chipping and riveting hammers. The Curtis Pneumatic Machinery Co., St. Louis, had in operation an overhead pneumatic crane with an air-hoist, an electrically driven air-compressor, a bracketed jib crane and an I-beam trolley crane.

The Cleveland Pneumatic Tool Co., Cleveland, George Oldham & Sons Co., Frankford, Philadelphia, and the Keller Pneumatic Tool Co., Chicago, all had interesting displays of pneumatic tools which have come to be indispensable in the foundry. The Keller company showed an attractive novelty in a model of a large riveting hammer, mounted with cut-out sections and moving to indicate the operation of the tool.

Comfort was a minor consideration, often entirely ignored in the old-time foundry. Molders were expected to be warm only when pouring off, and daylight was admitted sparingly and mixed with the wintry blasts through haphazard windows. Times have changed. Foundry heating units are much in evidence, and manufacturers have successfully divorced light from cold by providing steel frame sashes which can withstand the rigors of foundry usage. Robert Gordon, Inc., Chicago, showed a mechanical hot-blast heater provided with a sectional case which through numerous sliding doors permitted an inspection of the interior. Skinner Brothers Mfg. Co., St. Louis, showed a heater in which a motor driven fan sucks air through an outside intake and blows it through heating coils and out into the foundry.

The Sterling Wheelbarrow Co. featured its exhibit of metal flasks and wheelbarrows by some especially large special forms of flasks with intricate bars.

The displacement of human labor was typified in the various displays of foundry hauling units. The Mercury Mfg. Co., Chicago, showed a 3-wheel and a 4-wheel unit of its storage battery type tractor and two Bateman trailers. The tractors gave practical demonstrations during the erection of the various exhibits by hauling the heavy machinery into place about the floor of the exhibition hall. The Liberty Steel Products Co., New York, had two types of gasoline-driven industrial tractors and two lift trucks on exhibition, while the Cleveland Tractor Co., Cleveland, had one of the crawl type gasoline motor units in its booth.

Producers of foundry raw materials were plentifully represented. A most attractive minature model of a blast furnace was displayed by the Thomas Iron Co., Hokendauqua, Pa. The Semet-Solvay Co., Syracuse, N. Y., with Pickands, Brown & Co., Chicago, constructed a model of Independence hall, using coke for the building material. Rogers, Brown & Co., Cincinnati, showed samples of coke, alloys, pig iron and fluor spar together with finished castings. The 12-cylinder Liberty motor which was constructed as a permanent exhibit at the Smithsonian institute, Washington, was also displayed by this company.

Manufacturers of miscellaneous foundry supplies were more in evidence at this than at any previous show. Core compounds and the work produced by their use were shown by the American Gum Products Co., New York; Corn Products Refining Co., New York; the Robeson Process Co., New York; Werner G. Smith, Co., Cleveland; the Barrett Co., Chicago; Swan & Finch, New York; American Oil & Supply Co., Newark, N. J.; the Mifflin Chemical Corp., Philadelphia; and Spencer Kellog & Sons, Inc., Buffalo.

Welding and cutting apparatus has shown great advance during the past year under stress of reconstruction demand. An oxyacetylene installation for cutting stock up to 12 inches thick and oxyhydrogen apparatus for cutting even 36 inches of metal were shown by prominent manufacturers. Electric welding apparatus also was displayed.

Wood block floor which has found favor in the past few years for castings plants was demonstrated by the Republic Creosoting Co., Indianapolis, and Jennison-Wright Co., Toledo, O.

Varied Furnace Displays

Manufacturers of furnaces displayed different kinds of melting equipment and a number of concerns which did not show products had representatives on hand to explain the design and operation of their equipment. An assortment of nonferrous melting furnaces were shown by the Monarch Engineering & Mfg. Co., Baltimore. Four types of noncrucible furnaces including a double-chamber furnace, a vertical furnace and a rotary furnace were shown besides a tilting coke-fired furnace with crucible, a tilting oil-fired furnace with crucible, three oil, gas and coke-fired core ovens, a stationary oil or gas-fired steel melting furnace and a ladle heater.

The Hausfeld Co., Harrison, O., also showed variety of furnaces, including both crucible and noncrucible types. Their exhibit included a noncrucible furnace of the tilting type, a tilting crucible furnace, a stationary crucible furnace, an aluminum melting furnace using a cast-iron melting pot, a ladle heater and other foundry equipment for nonferrous metal.

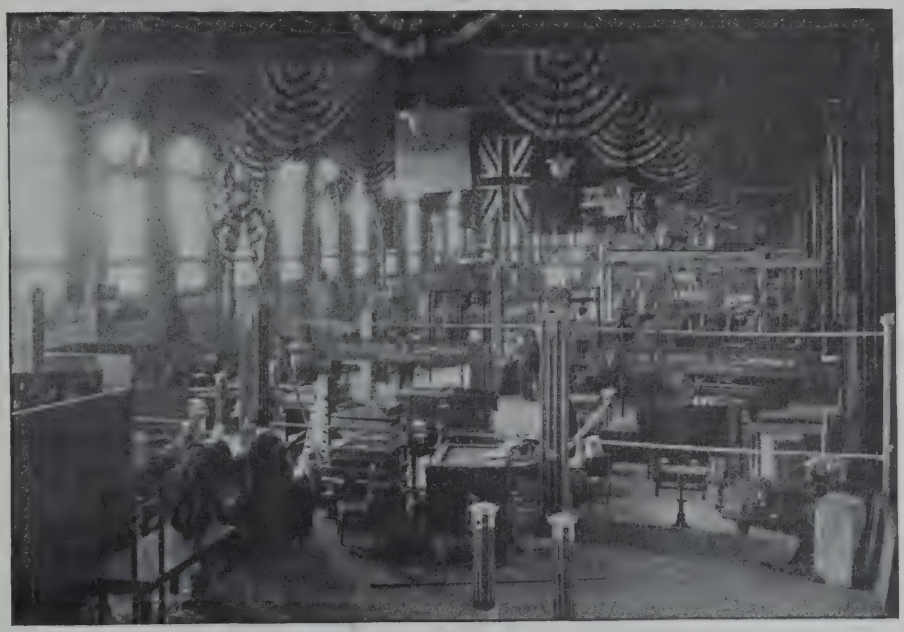
A 60-kilowatt Ajax-Wyatt electric furnace was among the exhibits of the Ajax Metal Co., Philadelphia. This furnace was not operated. This firm also had a display of yellow brass ingots which were made in the Ajax-Wyatt furnace. These ingots have depressions on each side which allow tongues to grip them firmly. A series of ingots made from different formulas and a variety of castings made from similar ingots were displayed. Among the castings were some water-back bearings and pump casings for motor-driven fire apparatus, both of which castings have thin wall sections. The Industrial Electric Furnace Co., Chicago, showed a recently developed process of preheating the charge before placing it in the electric furnace was displayed and details were fur-

nished covering the method of handling the charge before it is placed in the electric furnace.

Among the burners which attracted attention was an extra large one exhibited by the Hauck Mfg. Co., Brooklyn, N. Y. This burner, which has a nozzle 20 inches long, throws a flame 12 inches in diameter a distance of 20 feet. The length of the flame was illustrated by streamers blown by air, giving a slight idea of the size of the flame. This company also displayed burners for thawing frozen sand, coal or coke from cars or bins. These burners are new and have not been exhibited previously.

The Combustion Economy Corp., Chicago, exhibited a new design of pulverized coal feeding and burning equipment. This is provided with an air-tight rotary air gate, a variable speed direct connected gear case with speeds marked to conform to the operation of the air gate, and a powdered coal carburetor.

The Leeds & Northrup Co., and the Brown Instrument Co., both of Philadelphia, showed a number of recording and indicating pyrometers. The recently developed heatmeter using the Harrison-Foote method of compensation was shown by the Brown company. This instrument compensates for any variation in the line or thermocouple up to 15 ohms, which is ample to take care of any variation ordinarily met with.



A large section of the exhibition space was taken up by the Pangborn Corp., Hagerstown, Md., with a comprehensive display of sand blast equipment. At one end was a 90-inch rotary table cabinet for cleaning large castings. With this machine the operator stands on the outside of the sand-blast room and avoids the dust while cleaning castings. A 20-inch revolving table for taking care of smaller castings was in operation. Cabinet sand-blast apparatus and an abrasive separator for cleaning sand or other abrasives were shown, together with several other devices.

The J. W. Paxson Co., Philadelphia, had an exhibit of sand-blast apparatus including three separators and dust collectors and two kinds of barrels. This company also had installed a 54-inch cupola and displayed many of the other products handled by it, including foundry facings, sands, gravels and clays. The W. W. Sly Mfg. Co., Cleveland, showed a sand-blast mill and a turntable cabinet complete with sand and dust separating system.

A late type of cloth-screen dust arrester was shown by the Mott Sand Blast Co., New York. The Macleod Co., Cincinnati, exhibited two sand-blast barrels, a sand-blast hose machine and a portable oil burner. A 32-inch diameter, revolving barrel sand-blast machine and a 66-inch diameter sand-blast table were in operation at the exhibit of the Hoevel Mfg. Corp., Jersey City, N. J.

The American Foundry Equipment Co., New York, displayed the auto sand cutter.

Wm. Sellers & Co., one of Philadelphia's oldest manufacturers, exhibited two tool grinders, a drill grinding machine and a sand mixer, all operated by direct current. This company also had a sand mixer arranged for alternating current. This arrangement gives a variable speed such as cannot usually be obtained from alternating current.

EXHIBITS OF SAWS AND MISCELLANEOUS METAL WORKING EQUIPMENT

The Link Belt Co., Chicago, displayed a silent chain drive also an operating electric hoist of 1-ton capacity. It also exhibited a conveyor belt idler and a Rapp sand revivifier.

Working models of tractor, crane and screen types of sand cutting machines built by Wadsworth & Co., Cleveland, were shown. A most complete display of sand mixing machines of the Simpson-Muller type, varying from 3 to 6 feet in diameter were exhibited by the National Engineering Co., Chicago. The 6-foot machine was operated during the show.

An electrically operated sand sifter and a gas unit for cutting iron and steel by the use of artificial or natural gas was shown by the Vibrating Machinery Co., Chicago. A motor driven sand mixer was shown by the Standard Sand & Machine Co., Cleveland.

Brass tumbling mills, power and hand sprue cutters, core ovens, both gas and coke fired and brass furnaces for both coke and coal, characterized the extensive exhibit of the S. Obermayer Co., Chicago. Cherry and oak snap flasks with iron jackets also were exhibited.

To Build Furnaces

Organized with a paid-up capital of $1,000,000, the Booth Electric Furnace Co., Chicago, recently was incorporated and has acquired the patents, assets and good will of the Booth-Hall Co., electric steel and brass melting furnace manufacturer. The scope of operations of the old company will be enlarged.

The Booth rotating furnace, designed for melting nonferrous metals has been standardized and in the future will be built in four units, 250, 500, 1000 and 2000-pound capacities. The 2-phase, 2-electrode Booth-Hall furnace for melting iron and steel, will be made in five sizes, namely, ¾-ton, 1½-ton, 3-ton, 6-ton and 12-ton. An improved type of furnace, oval in shape, has been developed.

Officers of the new corporation are: President, L. E. Myers, president of the L. E. Myers Co., Chicago; vice president, C. H. Booth, former president of the Booth-Hall Co., Chicago; secretary, W. K. Booth, former chief engineer of the Booth-Hall Co. and treasurer, L. J. Clark, of the L. E. Myers Co. In addition to these men the board of directors includes Martin J. Insull, vice president of the Middle West Utilities Co., and E. W. Lloyd, of the Commonwealth Edison Co., Chicago.

Modern Industry

Should Rule in Weighing Dissolution Suit, Says Steel Corporation

That the court's decision of the government's suit to dissolve the United States Steel Corp. be rendered under the Sherman act in the light of the facts concerning the steel industry growing out of the war and not on the condition of the industry 20 years ago, is asked in a supplemental brief filed several days ago in the United States Supreme Court by the corporation. The suit, which has lain dormant while the war was in progress as no steps were taken to bring it to an issue, now stands sixth on the court's docket and will probably be up for hearing the latter part of October. At that time a final determination of the case is expected.

In its brief the corporation points out that in 1901 it produced but 50.1 per cent of the steel output of the country and that in 1911 this figure had dropped to 45.7 per cent, showing that it does not have preponderance in sense of power to control the industry. It further deals with the fact that although the case had lain dormant during the war, the corporation expended enormous sums in enlarging its various plants, which enabled it to meet the requirements of the government during the war. It points out that when the war broke out, it pressed for a speedy determination of the government's appeal on the ground, that the government's probable steel requirements would necessitate the erection of these plant additions, and the employment of a vast amount of additional capital, which would result in great loss and embarrassment to the corporation and its stockholders if the suit was decided against it. At that time, the government successfully resisted the appeal upon the ground that it was not in the interest of the public to have the case decided during the period of the war.

The brief further asks if any one can doubt that the corporation's ability to meet the government demands during the war was due to its size and strength, regarding which the government complained of "concentrated economic power," and further inquires if this power should be ruthlessly destroyed on the mere theory that it may possibly be abused.

Vote For 10-Hour Day

Employes of the Carpenter Steel Co., Reading, Pa., on Sept. 26 voted for a 10-hour day as a substitute for the 8-hour day. Out of 1450 employes of the company entitled to vote, 1206 voted and 840 declared themselves in favor of the 10-hour day, 165 in favor of eight hours, while 85 voted both ways. The 10-hour day means extra pay, if adopted.

Electric Steel

Discussed at Meeting of Electric Furnace Association in Chicago

More than 60 of the foremost electric steel men of the United States and Canada, attended the meeting of the Electric Furnace association, held at the Congress hotel, Chicago, Sept. 22. At the meeting an interesting paper was read by H. G. Weidenthal, in which the great demand for better steel in the automotive industry and the increased demand for electric steel in that field was pointed out. Mr. Weidenthal recited the great need for greater factors of safety in the vital parts of automobiles, trucks and tractors, and showed that the electric furnace would be called upon to supply steel of the proper quality.

In response to a demand for data on electric furnace products, the association has issued a booklet, containing such information as had been gathered. This effort was commended by those who attended.

At the meeting a permanent organization was effected and the following officers elected: President, Acheson Smith; vice president, C. H. Booth; secretary, C. G. Schluederberg and treasurer, F. J. Ryan. The executive address of the association is Box 616, Niagara Falls, N. Y.

It is thought that the next meeting of the association will be held next spring in conjunction with some of the national technical societies, and a symposium on the subject of power for the electric furnace will feature the meeting. Although the recent meeting was largely devoted to electric steel it is the intention of the association to take up the subject of nonferrous metals and other materials made in the electric furnace.

Among those who attended the meeting were L. E. Howard, of the Simonds Mfg. Co.; L. M. Reed, Haynes Stellite Co.; A. C. Jones of the Electric Steel Co., Chicago, W. F. Graham, of the Spicer Mfg. Corp.; E. S. Gardner, Illinois Steel Co.; Edward T. Moore, Halcomb Steel Co.; F. W. Chapman, of the Standard Steel Castings Co.; J. M. Blake, American Manganese Steel Co.; A. Trevor Jones, American Steel Foundries; A. H. Miller, Midvale Steel & Ordnance Co., A. U. Tirbutt, Manitoba Steel Foundries, Ltd., and many others interested in the electric steel industry.

Orders Held Up

For Refractories by Blast Furnaces and Steel Works Due to Strike

Pittsburgh, Sept. 30.—Makers of refractories are getting numerous requests from the blast furnace and steel interests to hold up shipments for the present, due to the strike. This in no way reflects a lack of demand, which still is reported to be good, but as much common labor is involved in handling the brick at the plants and this class of help, more than any other, is out on strike, shipments at this time would mean the tieing up of many cars and possibly heavy demurrage charges. This is the time of year when both steel and iron producers build up reserve supplies of refractories and a number of demands are coming out for shipment when the labor situation clears up.

Refractories

(Per 1000 f. o. b. works)

FIRE CLAY BRICK
(First Quality)

Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00

FIRE CLAY BRICK
(Second Quality)

Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00

SILICA BRICK

Pennsylvania	$40.50 to 45.00
Chicago	45.50 to 50.50
Birmingham	46.50 to 51.50

MAGNESITE BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 85.00

CHROME BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 90.00

BAUXITE BRICK
(Per Net Ton)

55 per cent	$ 40.00 base
76 per cent	100.00 base

Car shortages have been a factor in various producing interests for several weeks.

Decreased shipments have had no particular effect upon the operation of the brick plants, which are running between 60 and 70 per cent of capacity, or about the same rate as during the past month or six weeks. No special change has taken place in prices, but the market can be described as firm as not a few manufacturers are finding difficulty in getting back more than a new dollar for an old one on current bases. Labor is reported to be scarce and some companies have been obliged to increase wages to keep their organizations intact.

Agitators Sow Vicious Doctrines

Strike Talks by Organizers Reflect Radical Beliefs of Their Leaders — Foreign-born Workmen are Praised for Stopping Production and Forcing Americans Out of Work — Foster is Extoled

BY A. J. HAIN

WHEN the most radical leaders in the American Federation of Labor disregarded the advice of President Wilson and Samuel Gompers that the strike in the iron and steel industry be postponed until after the industrial conference they revealed a state of affairs in their own organization more menacing to the peace and welfare of the country than the conditions in the industry regarding which they complained.

If employers were to concede the truth of all the charges made by those radicals the people of the United States still would have more cause to fear the radicals than the employers. Questions pertaining to the open shop, the 8-hour day and rates of wages become of secondary importance when men of revolutionary tendencies ignore sane counsel and demonstrate that by appealing to the prejudices and passions of the foreign-born workmen they can force their will on a far superior number of Americans and interrupt a vital industry.

If the average American citizen could get in close contact with the campaign waged by the radicals; if he could hear the organizers, who take their cue from John Fitzpatrick and William Z. Foster, he would see the issue presented by the strike in its proper perspective. The average American citizen considers the strike as merely a controversy between the employers and employes in the iron and steel industry, something which does not concern him directly, if at all. But if he could attend the innumerable organization meetings and listen to organizers expound their doctrines, without moderation as on the witness stand before the senate investigation committee, he would realize that it is an issue of Americanism. If he could hear the little Fitzpatricks and Fosters tell thousands of applauding foreign-born common laborers that they deserve wealth, luxury and authority because they closed the mills while the American workmen did not have the courage to act he would know the deeper significance of it all. He would say that right or wrong, regardless of the merits of the case as stated by Samuel Gompers, they deserve to lose the strike. They deserve to lose it not only because of their precipitate action in paralyzing a great industry primarily to wrest power from the more conservative element in their own organization, but because they are inciting men against orderly form of government.

Studies The Strikers

RADICAL doctrines in their worst form are being preached by the agitators to the foreign workmen who constitute overwhelmingly the body of strikers in the present attack upon the steel industry. The ignorant, half-Americanized or unamericanized are being incited constantly to the pursuit of principles and the adoption of methods which are subersive of American institutions. To ascertain exactly what kind of vicious propaganda and deception the strike leaders are employing to keep the men in line, THE IRON TRADE REVIEW *had Mr. Hain of its regular staff spend several days in close contact with the workers in the Mahoning valley and in the Cleveland district. What Mr. Hain was able to develop and tells in the accompanying article, portrays accurately the dangerous character of the present strike and the evil, unscrupulous means used by the agitators to inflame the workmen. The fact that many of these rabid statements were made in meetings which were open to the public is suggestive of the violent and revolutionary utterances which it is reasonable to expect are made freely at the closed meetings.—Editor.*

"Don't Use Violence, But—"

Organizers at work in the centers of the industry stop short of the methods of the syndicalists as described by Foster only in this respect: They do not openly advocate the use of violence. They suggest that at some future time it may be necessary to do so, but they realize that the time is not opportune. Intimidation is a common practice; the wives and children of workers have been threatened and they have been warned that the men would be killed if they persisted in working; grocers, butchers and other tradesmen have been told that they would be killed, or that their stores would be burned if they sold provisions or gave credit to the workers, but in public meetings the organizers carefully refrain from advocating the use of force. An organizer will exaggerate conditions; he will play on the feelings of his audience, arousing hatred for employers and public officers and employes, and then as if to make his alibi secure he will tell the men not to carry firearms or resort to acts of violence.

The governor of Pennsylvania is the "Czar," the police are cossacks "who are riding into our homes and murdering innocent women and babes," because "they are ordered to do so by Kaiser Gary." If the mills are not opened when the strikers choose to return to work then the strikers must seize them, because they belong to the strikers; and if the government does not consent to operate them, then the laborers must operate them for their own account! The speeches of the organizers of the American Federation of Labor working under the direction of the committee in charge of the strike is tainted with revolutionary propaganda. Syndicalism has compromised on the question of force to win the support of the "peaceful radicals," but it is biding its day.

The agitators forced the stoppage of an industry in which they could claim but 20 per cent of the employes as their recruits. If they win the strike and gain complete control of the American federation it may be but a matter of a few months before they force suspension of other great industries. Resistance then may be fraught with serious consequences. It is that possibility which concerns every American.

* * *

GOMPERS testifying before the senate investigation committee said: "The disposition toward radicalism is so great now that democracy is sneered at by certain groups who say it is only a pretext which the employing classes hold up to cheat workers, and the workers can only secure justice by revolution."

While Gompers told the committee

THIS PICKET FOUND LIFE SO DULL HE TOOK ALONG HIS COCK-A-DOODLE-DO TO KEEP HIM COMPANY. WAGES HAVE BEEN SO GOOD, STEVE THOUGHT HE COULD AFFORD TO STRIKE FOR A WHILE

Foster has changed his views since writing "Syndicalism," the statements made by organizers indicate that they are in sympathy with the teachings in "Syndicalism," and Gompers' testimony shows that he knows it.

"There is not a squarer man in this country than that man Foster," said J. E. McCadden, an organizer for the federation, in addressing 1000 foreign-born laborers in Holy Name church, a stone's throw from the Ohio plant of the Carnegie Steel Co., Youngstown.

"Foster doesn't deny writing a book, but he's been all through that game and he says we're on the right track today. He has slung all the weight of his influence to you. He is a bright, honorable, upright man, and he doesn't leave a point unturned for you.

"They have been calling you a bunch of ignorant foreigners, but who makes the machines, the watches, the aeroplanes? You fellows," said McCadden. "If you fellows are a bunch of ignorant foreigners how are we going to class some of the employers? Some of them are not entitled to citizenship. They'll say, 'This Hunky, over here,' or 'that wop, over there,' only to get you to fight among yourselves. But, thank God, you know what you want, and how you're going to get it.

"I have been in labor organizations for 22 years, and it's the pride of my life the way you fellows have been sticking together and conducting yourselves. I would gladly die for you men! You are the most gentlemanly men of all the men that ever went out on a strike. I never in all my life saw anything like it and the history of the world never saw a squarer bunch than came out. The entire labor movement is back of you. The papers of the United States came out the other day and said Sam Gompers, president of the United States—I mean United federation—was against calling this strike. That was done only to discourage you.

"While I'm here I want to say a few kind words for Governor Cox. He's with the labor movement. That's why we haven't anything to contend with in Ohio as they have in Pennsylvania."

McCadden paused, gazed intently at his audience, and poised himself for dramatic effect. "In Pennsylvania," he said, "they are clubbing men, women and children—those infernal cossacks! They are driving right up on their steps and shooting right through ther houses! By order of the Steel corporation! Believe me, it's pretty near time you belonged to a labor organization.

"The corporations have their organizations to fix prices. How can they tell us we can't organize to fix the price at which we will sell our work? We are denied that right by Kaiser Gary! It's time you woke up and realized what you can get for your work. You are entitled to better homes, better clothing for yourselves and your children. The corporations don't believe in education if they can hold us down!

McCadden went on to explain the present demands of organized labor:

"Collective bargaining. That is a God-given right to organize and deal with the pirates of the earth. We want back pay for the time we have been out, or laid off. Mr. Boss gets his pay for the time he's sleeping. Let us get ours. Let us get ours so we won't have to work seven days a week to get it. We never want to be compelled to work 24 hours. We want sufficient wages to guarantee the American standard of living. Now what's the American standard of living? Wine and whisky and all the telephones they want—to order their steaks—that's their idea. But we want enough so we can feed our families. You hear a lot about a fair day's pay for a fair day's work, but we realize we are getting old; it won't be long before we can't work, and we want a little something extra to lay up for the rainy day. That's our idea of the standard of living! All we want! Clothes, food, theaters and automobile rides occasionally, for the laboring man, too! Not to sacrifice our children by letting the corporation tell us what we've got to work for.

"Then there's the double rate for Saturdays and Sundays and overtime. You want to get enough in eight hours so you won't have to work longer. Let 'em put the idle men to work if they need more men. If we've got to work overtime let us penalize them; if it costs more they'll put the other fellows to work. We've got to do it to beat these parasites of the earth!

"You men should be allowed to see your children in the daylight. Some of you haven't seen your children until this strike. My God! Is there anything more inhuman! Bringing up families without seeing them. I say this damnable corporation has got to stop this sort of thing!

"Gentlemen, you are going to lengthen your lives by joining this union, by getting better clothes, better food, and sanitary conditions throughout the country. It's absolutely the fairest clause that was ever put into an agreement.

"I'm no fire eater, but, by God, I'll tell you, you men are going to live!" he exclaimed. "Men who couldn't make a wheelbarrow are telling you they are going to close the mills. You men closed the mills and you will open the mills. If they don't open up the mills, the mills over in Europe will be only too glad to fill the orders and then you fellows can go back there for a little while and make good money. They are losing millions every day you stay out; you can't lose if you stick together and do just as you have been doing; they've got to give you what you want!

"They say the mills are going to stay down. That is the foolishest damn argument ever made. We must have iron, and if they don't open the mills the government will. Let us take the mills, and operate them; why should we make millions for the other fellows?

"All we've got for the boys who are bleaching over there is political democracy, not industrial democracy!

"You foreigners, as they call you, are putting the Americans to shame.

You're entitled to most of the benefits that may come of this strike. The Americans had to stop because you made 'em stop—now they're coming in. The so-called foreigners are entitled to all of the gains of this movement. You are the real leaders!"

In East Youngstown recently federal officers raided a hall, the headquarters of a group of syndicalists, who were working among the men of the Youngstown Sheet & Tube Co. That group advocated the taking up of arms to take the mills by force. The officers sought to catch "red handed" several leaders whose identity has not been revealed. They arrested 120 men, all but two of whom subsequently were released, but they did not find the men for whom they were looking. In East Youngstown there is a strong suspicion that the leaders whom they understood were to attend the meeting are included among the leaders of the strike movement.

* * *

AT A meeting of several hundred laborers in Cleveland, J. J. Keane, an organizer, told of an argument he had with a plant official.

"'Do you mean to tell me those common laborers are worth as much as the machinists?' he asked me," said Keane.

"'I certainly do,' I replied. 'Haven't they got stomachs? Haven't they got wives and children? Don't they deserve to eat the same as others?' And I told him they were going to eat a little cold turkey, too, I did.

"All we are demanding, men, is a living wage. You know you can't buy a suit of clothes that is fit to wear these days unless you pay $50. I went into a store the other day to buy an overcoat and the dealer showed me one for $100. Just think! One hundred dollars for an overcoat! Fifty dollars for a suit of clothes for you. Where are you going to get the money? How are you going to do it making $60, $70 a month?

"We have got to fight this out together. It's our chance, if we stick together. Sign up! Get your friends to sign up! If we win it means we are going to have some of those things the bosses are enjoying, but if we lose you might as well tie a shot around your neck and go to hell.

"The reason the men didn't go out in Lorain is because they are scared. They are working 10 and 12 hours a day down there, and yet Judge Gary is saying they are working because they are satisfied. We are going to show up that bird. He isn't sleeping well these nights. He has all the luxuries, more than he needs, while the poor devils who are working for him can't make a decent living.

"Mayor is With Us"

"Experience shows that the less hours you work the more you will get paid for what you do. But you have got to organize to do it. Look at the other fellows; the street car men, for instance; the railroad men; they've got enough sense to organize and stick together, and that's the reason they get what they want. Why, we have all the power on our side, if we only organize to use it. We've got to get together and talk our business over, like men.

"I heard of a case where a policeman standing outside of a plant saw some men. The policeman said: 'If you want to go in, go on in.' They looked like strike breakers. We went to the city hall and told them about that; they told us the next time we hear of a case like that to take the policeman's number and they would attend to him. So when you see a policeman telling those guys to go in, just take his number. We will get those kind of birds.

"I never knew of any city before where the mayor said he would run the strike breakers out of town. That shows he is with us. It shows we've got 'em going. We are winning the strike."

The *Plain Dealer*, the leading newspaper in the Cleveland district reported the meeting at which Keane made his statements as follows:

J. J. Keane, American Federation of Labor organizer, and John Luthringer, business agent of the machinists' union, addressed a meeting yesterday in Stoke's hall, St. Clair avenue, near St. Clair street, in which both cautioned the strikers to preserve order. "Stay completely away from the factories," they urged.

Luthringer, an organizer for the federation said at the meeting:

"The employers are up to their old forms of treachery. We had a lot of talk about propaganda during the war but it can't compare to the insidious propaganda of the employers. It shows that if you lose this fight you are going down to the bottomless pit.

"The war taught us the greater benefits of democracy. We sent our boys over there to die for humanity, and we were given to understand that

PAYING OFF WORKMEN AT THE YOUNGSTOWN SHEET & TUBE CO.'S PLANT. NO SIGN OF POVERTY OR STARVATION AMONG THESE MEN. MANY OWN HOMES, AUTOMOBILES AND HAVE BANK ACCOUNTS

this world would be a better place for us to live in; we were told that every man would get more of the good things of life, but you know you haven't. President Wilson gave you the right of collective bargaining, and don't you let anybody take it away from you. The way to bargain that way is to let your union bargain for you, by signing up."

The chairman of the meeting, a young man who spoke with a foreign accent, explained the situation to a group of men after the meeting.

"The mayor is with us," he said. "The mayor is seeing that no strike breakers are let in. The other day they took 60 off a train from Detroit and shot them back. Don't you fellows carry firearms—but if you can stop 'em without breaking their heads, why do so. We'll stand back of you."

He impressed on the men the importance of getting others to join the union.

"I'll tell you how this works," he said. "We had only 200 men at the Lakeside plant (of the Otis Steel Co.) in our union. They had 1300 men there, but we made 'em shut down. That's what we can do."

* * *

WHAT caused the strike? The professional labor agitator saw an opportunity to capitalize an impression created in the minds of foreign-born workmen during the war that employers are making fabulous profits, and that they are entitled to a greater share of it, in accordance with the principles of democracy.

Common laborers, for whom the agitators are shedding tears, are well dressed, well fed and well housed. A great number of the younger men now idling away their time near the mills and in the streets wear silk shirts. There is no evidence of starvation or poverty, but many indications that so far as physical comforts are concerned the laborers have every reason to be contented. Nowhere in the Mahoning valley or elsewhere are there indications that the men are oppressed, overworked, or as the agitators say "in the depths of despair."

The strike is considered by the men in the nature of a diversion, a holiday, a gamble against the loss of a few days' wages that their leaders will succeed in getting more money for them. It is a strike without the impetus and force that come from the determination of a great body of men to wipe out an injustice, it is a strike for the luxuries of life, based on wrong premises and fomented by agitators who have nothing in common with those whom they claim to represent, except as they might be able to use them to gratify their own personal ambitions.

Storekeepers in the strike centers will tell you that all classes of men who work in the mills have more money, and spend it more lavishly, regardless of high costs, than they ever did before. Bankers in those communities say many laborers have on deposit with them from $2000 to $5000. A storekeeper in East Youngstown, catering almost solely to the foreign laboring class, said that before the war he had silk shirts for sale at $2.50, but the laborers could not afford them. Today the shirts cost from $5 to $10, and the laborers are wearing them. They are wearing better clothes, and their wives and children are wearing better clothes than they ever did, and the laborers are paying more for them.

Workers' Conception of 8-Hour Day

"What of the demand of the 8-hour day?" I asked the employment manager of one of the largest independent corporations. He replied:

"I have had thousands of foreigners apply to me for jobs, and I can say that the great majority of them, as one of the conditions for going to work, have insisted that they be given an opportunity to work extra time, even on Sundays. They consider a 10-hour job better than an 8-hour one, and if they are given a 12-hour job they consider that better still. The reason is they want the opportunity to get time and one-half for overtime. So many of them have wanted this opportunity that there was no other thought about it until the labor agitators appeared.

"The agitators told the men they should receive the money they now earn in two hours for eight hours. If they win, and wages are raised, they will be right back demanding they be given a job so that they can work 10 or 12 hours to make more money. It is a time-serving proposition with them; if we had a 6-hour day, six days a week, and if wages were established on a fair basis, they would want to put in more time. Education and advancement along lines of American workmen do not figure in their calculations. The less work and the more time, the better they are satisfied.

"Uneducated, untrained and, often, unwilling workers have the notion that because they can wield a pick and shovel, or lift a heavy weight they are entitled to the fat of the land, fine homes and automobiles. The agitators have told them that they, the producers, are entitled to what they produce, and that it is the policy of this country to give it to them. There are thousands of them so firm in that belief that they would shoulder guns tomorrow, to fight it out, if their leaders told them, and the number is growing and will continue to grow until the government curbs the men who are preaching industrial unrest.

"We have laws opposed to restraint of trade, but no laws to prevent a few agitators and their followers from depriving thousands of others of work. We think we have solved the problem of wars and have made it impossible for them to recur, but we shy at the problem of prohibiting strikes, and we jeopardize the whole country for fear of treading on the toes of a few agitators."

Public sentiment in the steel producing centers was opposed to the strike. Newspapers, except in a few instances, have not publicly taken sides in the controversy as a matter of policy, but the newspapermen investigating and reporting the strike say the men did not have sufficient cause to tie up the mills. Go anywhere in the strike districts, question professional men, tradesmen, bankers, lawyers, clergymen and you will find a unaniminity of opinion—the men were not justified.

S. T. Hammersmark, in charge of the strike in the Youngstown district, went into a bank where he has funds on deposit. The president of the bank called him into his private office and asked him how the strike was going.

"Fine, fine," said Hammersmark. "The heads of the companies here are treating us fair. It is the first time in history when strikers have received so much consideration from the companies against whom they have struck. They are gentlemen; I will have to say that for them."

The writer asked scores of strikers why they quit work.

"To make Mr. Gary talk," said one.

"Union say 'go out' I go out," said another.

"One hundred fifty millionaire last year," declared another, meaning that he understood 150 millionaires were "made" in the United States. "Me want some."

Not one of all those questioned said he was striking for an 8-hour day.

In the meantime, the idle men are losing $14,700,000 a week in wages. The country is sustaining a tremendous economic loss, and if the "prestige" of President Wilson is upheld the men will go back to work before their claims are even considered.

"Prestige" is suggested by the fact that when Mr. Fitzgerald was asked by a member of the senate committee why the workers went out he said it was to uphold the prestige of the President. The President, he said, had asked Judge Gary to grant the union leaders a conference, so when Judge Gary refused there was nothing for the union to do but uphold the President's prestige.

The agitators are said to have seized on the point that Judge Gary would not confer with them, and to have made the most of it in talking with foreigners.

"I believe they are just as well satisfied now that Gary did not receive them," said a plant official.

Probe Bares Iniquity of Strike

Gompers and Fitzpatrick Before Senate Investigation Committee Display Ignorance of Actual Conditions in Steel Industry—President of the Federation Yields to the Radicals—Congressmen Demand Action Against Strike Agitators

WASHINGTON, Sept. 30.—Hearings begun last Wednesday morning before the senate committee on education and labor on the resolution of Senator Kenyon, chairman of the committee, to investigate the steel strike, have developed two especially significant facts.

First, Samuel Gompers, president of the American Federation of Labor, in his testimony on Friday morning committed himself to the side of the radical element of the federation, giving unqualified approval to William Z. Foster, secretary-treasurer of the steelworkers' organization committee.

Second, the failure of either Gompers or John Fitzpatrick, chairman of the committee, the first witness, to make a case against the employers.

Both witnesses showed an almost total absence of knowledge of working conditions and wages in the iron and steel industry.

It developed during the hearing that the sentiment of congress, and perhaps that of most of official Washington, is overwhelmingly against the strikers.

Agitators Condemned in Congress

The strike agitators have been condemned in both the house and senate. Representative John G. Cooper, Youngstown, O., a member of the Brotherhood of Locomotive Engineers, bitterly assailed Foster. He warned labor not to heed the radicals, who, he said, are trying to destroy the American Federation and stir up a country-wide revolution.

Senator Thomas, of Colorado, introduced a resolution, referred to the committee on judiciary declaring the closed shop unamerican and proposing to make labor combinations unlawful. Senator Pomerene, Ohio, severely criticized Foster and said that unless he and his kind are removed from power, organized labor will be ruined.

Representative Kahn, California, conferred with Attorney General Palmer and urged federal prosecution of Foster on the ground that he is inciting revolution in the United States by his writings. It was disclosed that the attorney general has secret service agents investigating the activities of the strikers.

Reports received in Washington indicate a favorable attitude taken by broad-minded men throughout the country on E. H. Gary's refusal to arbitrate the principle of the open shop.

Labor leaders declare Gompers has capitulated to the radicals as a matter of expediency to save himself from being dethroned as the head of organized labor. It is believed that the federation must soon come out openly in favor of the most radical views or oust Foster and his followers. Gompers is well aware of this fact, and it is said that he is preparing to jump to that faction which will predominate. Yet others claim Gompers, by reason of his approval of Foster is nearing the end of his connection with the federation, which they insist will not be destroyed or turned over to the radicals.

A few days before Gompers appeared before the senate committee on education and labor, he said to the senate committee on interstate commerce: "The strike is now on, much to my regret, because I wanted to see it delayed until after the President's industrial conference." The statement does not accord with one he made before the committee on education and labor. He told the latter that he could not escape the conclusion that the calling of the strike for Sept. 22 was justified. These statements are interpreted as an attempt by Gompers to "straddle."

Ignorant of Conditions

Fitzpatrick assailed the United States Steel Corp., employers generally, the Pennsylvania state constabulary, and mill town officials. Neither he nor Gompers were able to give specific facts leading up to the strike. They said they had no personal knowledge of conditions of workmen in the steel industry. Fitzpatrick proved amazingly ignorant of facts regarding hours of work, wages, and living conditions of steel mill employes, but frequently resorted to theatricals to impress the senators.

Gompers, shrewder than Fitzpatrick, made a clearer statement, but was unable to answer satisfactorily important questions put to him, and failed to produce the impression he evidently hoped to do.

Interest now centers in the testimony to be presented to the committee Wednesday by Judge Gary. The committee probably will go to Pittsburgh and perhaps take the testimony of workers, managers of steel mills and officials of mill towns.

Senator Kenyon announced that he desires to close the hearing at the earliest practicable date to determine whether any federal action is warranted.

Foster "Reformed" Praised by Gompers

WASHINGTON, Sept. 30.—During the course of his testimony last Friday before the senate committee on education and labor at the steel strike hearing, Samuel Gompers, president of the American Federation of Labor, presented only one illuminating, outstanding fact worthy of serious consideration. That fact is that he gave unstinted approval of William Z. Foster, the author of "Syndicalism." All the other statements of Mr. Gompers, accompanied by cultivated gestures, an autocratic cocksureness, and lordly demeanor, were relatively unimportant. His actual knowledge of the steel strike was negligible. All the information he could offer admittedly was based on hearsay.

The hearing of Mr. Gompers was nearing an end, when Senator Kenyon, chairman of the committee, asked him pointedly about Foster's writings, and the charge that radicals are trying to get control of the American Federation of Labor.

"I have heard the saying, 'O, that my enemy might write a book!'" began Mr. Gompers. "When it was reported Foster, the I. W. W. delegate, wanted Mr. Duncan, vice president of the American Federation of Labor, excluded from the labor conference in Zurich I classed Foster with Heywood.

"It was a year or so later, about 10 years ago, that Foster wrote his pamphlet on syndicalism. About one year after that pamphlet was written I was at a meeting of the Chicago Federation of Labor and was called upon to make an address. One delegate arose and expressed thorough approval of my address. I did not know who the delegate was. Much to my amazement after the meeting I found out that the delegate was Mr. Foster. I addressed a letter to him, expressing appreciation of his change of mind and telling him that by pursuing such a constructive policy as he had outlined in his approval of my address he could be of service to the American Federation of Labor and I encouraged him.

"I am willing to build a golden bridge for my enemy to pass over, and to help an erring brother. In view of what Mr. Foster has done to improve working conditions in the Chicago stockyards, and in view of what he is doing now, he is entitled to something better than to be held up to the contumely of the public."

"So there is no doubt that Mr. Foster has changed his views?" asked Senator Kenyon.

"I would not serve with him if he had not changed his views," replied Mr. Gompers.

But, despite the attempt of Gompers to give Foster a clean bill of health, the idea apparently persists among members of the committee that Foster still is a man of radical ideas. If he does not express them, it is contended, it is only because he thinks he lacks power to support them.

Gompers attempted to give the issues of the steel strike, what led up to it, and what followed. The issues, he said, are the right of employes to be heard through their representatives and to have something to say about their hours, wages and working conditions. These rights, he asserted, have been denied for the past 25 years with all the power, influence and determination of the corporations. More indirectly, he said, they were denied by illegal and unwarrantably brutal means.

He endeavored to show that the corporations through collusion with steamship lines, including the German-American, North Lloyd's and the Hamburg company, brought men from southern Europe, the Balkan states, etc., and said that if trouble now arises the responsibility lies with the corporations.

Mr. Gompers said employes work 365 days a year and 12 hours a day, operating in shifts of two weeks, and during the transition from night to day work work 24 hours straight. Recently the Steel corporation ordered into effect the 8-hour day, but, he said, his understanding was that "there was more in the order than in its ob-observance."

"You have said that the Steel corporation tries to operate the open shop," said Senator Phipps. "Will you tell the committee the attitude of the American Federation of Labor about the employment of nonunion men in shops which have been organized?"

"The American Federation of Labor has nothing to do with it," said Gompers. "That is up to the national trade unions, whose policy is to try to organize the workers 100 per cent."

Senator Phipps asked Gompers if he could give instances where superintendents of plants refused to meet workmen to hear grievances. Gompers said he could state "instances without number," but instead of doing this he merely had his secretary read a resolution adopted at the convention of the federation in St. Paul in June of 1918, demanding "the rights of citizenship" to confer with employers over grievances.

He told of attempts to secure a conference for the committee with Chairman E. H. Gary, of the United States Steel Corp., and the failure of President Wilson to bring about the conference, after the committee asked the President to help it.

Writings of Woodrow Wilson in 1907 and 1909 bitterly condemning labor unions were read by Senator Phipps, who asked Gompers if he thought the President had changed his views since then. Gompers told what Mr. Wilson as President had done for organized labor, and declared the President has changed his views.

"Why was not the strike postponed, as requested by the President, until after the industrial conference?" asked Senator Kenyon.

Gompers said he wrote to Fitzpatrick urging that the strike be postponed as requested by the President, a copy of the letter being given to all 24 presidents of the international unions. A few days later he received a letter from Fitzpatrick saying it would be impossible to hold the men, although some of the presidents of the union favored deferring the strike.

"Do you think their action was justified?" inquired Senator Kenyon.

"I cannot escape the conclusion that the favoring of the strike as originally planned was justified," replied Gompers.

Senator Sterling mentioned the high wages paid by steel companies to skilled workers. Gompers sneered.

"It is a favorite pastime of a few interests to pay big wages," he said. "They are like the man dangling the carrots on a pole before the horse to make him run faster. These men are really 'sweater' men. And they have to pay their helpers out of their own wages."

Senator Sterling then proceeded to show the average day wage paid to employes of the Steel corporation is $6.23. Gompers remarked in sarcastic tone about the misleading character of averages. He did not think much of the pension or bonus plan of the corporation, and its welfare work, he said, could be best explained by using the terms of the seamen, who, he said, call it "hell-fare" work.

Fitzpatrick Ignorant of Conditions

WASHINGTON, Sept. 29.—Groping and dealing in generalities, admitting that he does not know anything about the practical operations of the steel industry and never was inside a steel mill, John Fitzpatrick, chairman of the steel workers' organization committee, made a poor witness before the senate committee on education and labor last Thursday when it began its investigation of the steel strike.

Fitzpatrick was especially weak in his testimony when he attempted to reply to specific and searching questions by Senator Phipps, of Colorado, former treasurer of the Carnegie Steel Co., whose practical knowledge of the steel business discomfitted him. During his testimony Fitzpatrick said he was willing to submit the union's demands to arbitration.

Attorney W. B. Rubin, counsel for the steel workers' committee, sat at the left of Fitzpatrick, often aiding him when difficulties arose in answering questions.

Fitzpatrick read telegrams and told of efforts of the committee to have a personal conference with Chairman

E. H. Gary, of the United States Steel Corp. Then he began a tirade against the corporation and its alleged vicious treatment of employes. He told the committee union men considered all mills were Steel corporation mills, no matter what name they had over the door.

He declared the Steel corporation 18 or 20 years ago (it was incorporated in 1901) appropriated "from $2,000,000 to $20,000,000" to destroy unionism.

Replying to a question by Senator Jones, New Mexico, Fitzpatrick said the organization of the men was begun upon the initiative of the American Federation of Labor and not at the request of the men themselves. He told of the alleged spread of unionism among the men, and of opposition, which, it was asserted, was met at Homestead, Duquesne, Clairton, Pa., and other points in western Pennsylvania, "where conditions worse than the padrone system prevail."

By May, 1919, Fitzpatrick said, something like 80,000 men in the steel industry had been organized in the Calumet and Pittsburgh districts. Fitzpatrick threw some light on the conference between the committee and President Wilson when he said it was its purpose to lay the "horrible conditions" in the steel industry before the President and to ask the latter to try to arrange the conference with Judge Gary. The President, according to Fitzpatrick, promised to try to arrange the conference and did make the attempt, but failed.

"How many men voted to strike?" inquired Senator Wolcott.

"I do not know the number who voted," said Fitzpatrick, "as each union sent in a report instructing us of the percentage voting for the strike."

Fitzpatrick said that 98 per cent of the members of the union voted for the strike and that 50,000 men had joined the union between July and the time of voting, "making the total membership of organized workers in the steel industry at that time 150,000."

Senator Kenyon, Iowa, chairman of the committee, asked Fitzpatrick if there would have been a strike if Judge Gary would have granted a conference.

"No, sir," replied Fitzpatrick.

"If Mr. Gary were now to consent to a conference, would that end the strike?"

"I don't think so," replied Fitzpatrick. "The 350,000 men on strike will not return to the mills until they get decent consideration or until congress gives us justice."

The senator wanted to know why the strike could not wait, as suggested by President Wilson, and Fitzpatrick referred to the letter from the committee to President Wilson, in which it was said the men could not be restrained, etc.

Fitzpatrick volunteered the statement that had they waited "the 24 presidents of the international unions would have been shot to pieces by the steel company gunmen, and mill town officials." He added that he never went to western Pennsylvania without first kissing his wife and children goodbye, because he never expected to see them again.

Senator Kenyon asked Fitzpatrick if all the strikers are affiliated with the federation.

"Yes, sir," he replied.

"Can you produce records showing the actual number of men who voted for the strike?"

"I shall try to produce those records," said Fitzpatrick. Rubin quickly said that that could not be done "unless the steel workers' committee knew the subsidiaries of the Steel corporation."

Replying to a question by Senator Wolcott, Delaware, Fitzpatrick said all of the 150,000 union men had the right to vote and that a vote also was taken among nonunion men, "all of whom except two voted for the strike." Fitzpatrick scoffed at the idea that Americans did not want to strike.

"But Representative Cooper has made the very serious charge that the strike was declared by aliens," said Senator Kenyon. Fitzpatrick replied that he did not state the proportion of Americans and aliens who voted to strike, but said there were only a few who could not speak English.

After stating alleged sacrifices of steel workmen and their families during the war for the United States, Fitzpatrick said:

"If what is going on in Pennsylvania continues it will not be confined to the steel industry. Nobody can tell what the outcome will be. In Homestead the cossacks rode in a house, knocked a pot of food from a stove on a woman with a child in her arms and scalded her."

"What was your former occupation?" asked Senator Phipps.

"I am a horseshoer by trade," said Fitzpatrick.

"Have you had any actual experience in steel mills or foundries?"

"None. I have no knowledge of the steel business except that I get from the steel workers."

Asked as to wages paid in the steel industry, Fitzpatrick told Senator Phipps he could not say what they are. Mills, he said, operate on a 12-hour basis."

"Don't you know," asked Senator Phipps, "that Steel corporation mills for the past two years have operated on the 8-hour basis, except where continuous operations are necessary?"

Fitzpatrick evaded the question and admitted he could not say what percentage of employes work on a 12-hour basis. Phipps asked if he knew some skilled workers get $20, $40 and $60 a day. Fitzpatrick said those wages were only "pittances" when consideration is given to the "awful conditions" under which they work. Senator Phipps also challenged the statement of Fitzpatrick that the men worked seven days a week, saying they worked six days, except in some departments, such as blast furnaces, and that as a matter of fact the 10-hour day, six-days-a-week plan is generally followed.

Foster an I. W. W. Says Senator Pomerene

Washington, Sept. 30.—"God help labor when it gets into the clutches of men of that type!" exclaimed Senator Pomerene in the senate last Friday, in referring to William Z. Foster, secretary-treasurer of the steelworkers' organization committee..

Senator Pomerene read from a letter published in *Solidarity*, the official organ of the I. W. W., on Nov. 4, 1911, in which Foster urged the I. W. W. to "work within the American Federation of Labor to make it a revolutionary organization." The letter was commented on in an article appearing in *The Christian Science Monitor,* which said Foster at that time was a candidate for editor of another I. W. W. publication, *The Industrial Worker*, published at Seattle, Wash. The letter of Foster said in part:

"I am satisfied from my observation that the only way for the I. W. W. to have the workers adopt and practice the principles of revolutionary unionism—which I take is its mission—is to give up the attempt to create a new labor movement, turn itself into a propaganda league, get into the organized labor movement, and by building up better fighting machines within the old unions than those possessed by our reactionary enemies, revolutionize these unions, even as our French syndicalist fellow workers have so successfully done this."

This letter was signed, "Yours for revolution, William Z. Foster."

"And now this man, with that record, which he himself wrote in 1911, is parading himself before the public as one of the friends of labor!" declared Senator Pomerene.

The senator then read from the pamphlet which was issued by Earl C. Ford and William Z. Foster from

(*Concluded on page* 920)

Labor Gets Most of Mill Income

Study of Reports of Four Important Steel Companies Reveals Profits Equivalent to Less Than $2 Per Employe Per Day in 1918 — Under $1 in June Quarter — Men Misled by Uneconomic Teachings — General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

CONTENTIONS of loose-tongued prophets of discontent that labor is not receiving its fair division of the earnings of industry are shown to be utterly without basis of fact, at least insofar as the steel industry is concerned, by the results of a study made by THE IRON TRADE REVIEW covering the reports of four large representative iron and steel companies.

This survey lays bare the fallacy of the theory that companies are wont to gobble up in profits from 80 to 90 per cent of the value created by labor. Instead of profits being vastly greater than wages, they are shown to be invariably smaller and in some instances amounting to but a fraction of the share that goes to compensate labor.

As indicated by the accompanying tables the companies included in the study were the United States Steel Corp., the Republic Iron & Steel Co., the Bethlehem Steel Corp., and the Lackawanna Steel Co.

Had the net profits of these companies for 1918 been pro-rated among their respective employes each man on the payroll of the Steel corporation would have received a daily additional income of $1.48; Republic's employes would have received $1.69 each; Lackawanna's $2.21, and Bethlehem's $0.54.

Had the same process been applied to the profits of the June quarter of 1919 employes of the Steel corporation would have benefited to the extent of but 84 cents daily; Republic to the extent of 45 cents, while Lackawanna shows a deficit for the period equal to 25 cents for each employe.

The study further shows that instead of increasing since 1913, the proportion of net profits per man per day to the average daily wage per man actually has receded. In 1913 the net profits per day per employe for the Steel corporation were 39 per cent of the average daily wage; in 1918, the war period, they were 27 per cent; and for the June quarter, 13 per cent.

In 1913 the net profits of the Republic company expressed in terms per employe per day were 30 per cent of the average daily wage; in 1918 they were 32 per cent and in the June quarter they were 9 per cent. Bethlehem shows a similar record with net profits of 38 per cent of the average daily wage in 1913 against 9 per cent in 1918. No record of Lackawanna for 1913 is available.

The discrepancy is shown even greater when total wages are compared with the sums diverted in dividends to preferred and common stockholders. The corporation's employes received $452,663,524 in wages during 1918 while its stockholders were given but $96,382,020. Republic's stockholders drew $3,381,460 while labor got $23,747,260 from the earnings. Dividends of the Lackawanna company amounted to $2,983,287 as compared with $20,503,737 devoted to labor. The most amazing record in this respect was made by the Bethlehem company with $167,118,484 for labor's compensation and $9,386,160 for the compensation of stockholders.

The increase in wages since 1913 for all of the companies and particularly for the Steel corporation and Bethlehem have been far greater than the advance in dividends. For instance the annual payroll of the Steel corporation since 1913 to 1918 increased 113 per cent while dividends increased 92 per cent. The Bethlehem company discloses a remarkable increase in wages, over the period, of more than 1100 per cent while dividends advanced but 350 per cent.

The facts as brought out merely serve to emphasize the utter preposterousness of the arguments of radicals and false economic teachers whose aim is to discredit the wages system in the eyes of labor. Labor has been led into the error of confusing gross earnings and net profits. The agitators have pointed to the huge figures representing gross and their followers unschooled in the essentials of sound business finance have taken only this total into consideration, giving no heed to the tremendous legitimate charges that must be made against the gross before the total income of a business is sifted down to the basis of net profits. The tax factor alone is a tremendous burden on business. The Steel corporation in 1918 paid $274,277,834 in excess profits tax to the government, a sum exceeding the dividends, but less than the fund for wages.

With invidious comparison and fiery oratory agitators have elaborated upon the vague fabulous earnings of steel companies and the comparatively modest income of the individual workman and the result, in the case of the ignorant or unthinking, has been discontent. In a recent address Charles Piez, former director general of the

How Earnings and Wages Compared in 1913

	Total number of employes	Total wages	Net profit available for dividends	Total dividends	Average daily wage	Net profit per employe per man
U. S. Steel Corp.....	228,906	$207,206,176	$82,004,683	$50,634,802	$2.92	$1.14

* Loss.
** No quarterly report.

Emergency Fleet corporation declared that the idea that labor is not receiving a just share of profits underlies the general unrest. He asserts that numerous sane-minded, intelligent though misguided American workmen cling to this view, many of them believing that their employers are earning 350 per cent or more of the wages. Men in this state of mind are more susceptible, than others, to bolshevist poison inciting them to assume control of industries and expropriate the owners.

They see beckoning visions of great wealth that would accrue to them under "the new order" and to these deluded dupes the cold fact that equal division among them of the total fund now going to capital, providing the efficiency of industry could be maintained, would add only little more than one dollar a day to each individual's income, would come as a rude shock. But the efficiency of industry could not be maintained; production would drop off enormously, and while money wages might increase there would be a disastrous decrease in the supply of comforts and necessities of life.

Intelligent socialists realize that production is the great need and that to hold up the glittering prospect of riches to labor if the capitalists' fund were appropriated is a vicious and misleading falsehood. Yet it is only by this means that the masses could ever be moved to embark upon the insane experiments of radicalism. It is important that the masses be enlightened as to the facts for their own good.

American Ship '19 Output Breaks Record

The American Shipbuilding Co. produced the greatest volume of ship tonnage in its history during the year ended June 30, 1919, and gross earnings were $20,857,057 as compared with $16,206,662 in 1918, yet net earnings after allowing for charges and $7,434,181 for taxes were only $3,784,434 against $6,626,265 in the preceding year. General expenses in 1919 increased to $6,545,895 from the $1,931,641 for 1918.

During the year the company paid 7 per cent on preferred and 23¾ per cent on common stock. The balance sheet shows an expansion of assets and of liabilities from $60,230,769 to $152,584,437, construction work in progress being the chief factor in the increase. This item grew from $16,790,045 in 1918 to $100,431,229 in 1919. Cash grew from $10,300,476 to $14,416,960 in 1919, while United States securities held increased from $4,989,710 to $9,221,545. Inventories decreased from $4,814,984 to $3,803,163 in 1919.

According to President M. E. Farr the total cargo tonnage completed and delivered in 1919 was more than two and one-half times that of 1918. During the year 109 ocean cargo ships of 422,800 gross tons carrying capacity were completed and delivered. On June 30 the company had yet to deliver 63 ships to the United States Shipping Board Emergency Fleet Corp. The company sold the Scott Steamship Co. stock amounting to $550,000 at par. The comparative income account follows:

	1919	1918
Gross earnings	$20,875,057	$16,206,662
Other income	11,218,615	860,529
Totals	$32,093,672	$17,067,191
General expenses	6,545,895	1,931,641
Depreciation	945,931	693,847
Repairs	2,949,511	1,723,453
Taxes	7,434,181	5,944,164
Transferred to surplus	3,784,434	6,626,265
Dividends	2,358,000	
	$ 1,426,434	
Surplus July 1, 1918	9,947,829	
Net credit	482,724	
Total	$10,430,553	
Surplus June 30, 1919	11,856,987	

Purchase Terms Given

Details of the acquisition of the Spencer Wire Co., Worcester and Spencer, Mass., by the Clinton-Wright Wire Co., just made public show that the purchaser obtained the Spencer branch plant outright and the Worcester plant on an installment plan of payment under lease. The latter is to be paid for in 24 semiannual installments of $100,000 each, a total of $2,400,000. The property was appraised at $2,700,000.

In addition to this the purchaser will pay the Spencer Wire Co. an annual rental of $142,375, making the total annual payment $342,375. The total received for the Worcester plant when the final cash payment is made will be $4,108,500. What was paid for the Spencer branch is not made public, though it was appraised at $620,000.

National Acme Gross Falls

Gross sales of the National Acme Co., Cleveland, for the eight months ending Aug. 31 were $7,677,856 as compared with $10,039,082 for the same period the previous year. Profits exclusive of excess profits and capital stock taxes were $2,097,103 as compared with $3,785,822. Although these figures show a decrease for the first eight months of this year as compared with 1918 it is possible that with the reduction of taxes, net earnings for the year will be as large as a year ago.

Production Cut

In Coal Tar Products by Strike—Supplies Are Allotted

New York, Sept. 29.—The steel strike has retarded the movement of benzol, toluol and solvent naphtha. Some sellers claim that production has been reduced to 25 per cent of normal, and these interests generally are using the utmost discretion in allotting tonnage. This condition, however, is expected to be only temporary. An improvement already is in evidence, and in some quarters normal operations are anticipated within a fortnight.

Quotations remain very firm at last week's levels. Pure benzol is quoted at 24 to 29 cents and 90 per cent at 24 to 28 cents. Toluol is holding at 25 to 30 cents and solvent naphtha at 22 to 27 cents. Naphthalin continues in heavy demand with virtually all sellers booked five to six weeks ahead. The dye manufacturers are possibly the largest buyers at this time, covering on large quantities of naphthalin flakes. Prices, however, are holding unchanged at 6½ to 7½ cents for naphthalin in flakes and 8½ to 9½ cents for naphthalin in balls.

Demand for sulphate of ammonia is still confined principally to exporters. The Japanese are said to be displaying quite a little interest at this time. However, no large tonnages are being bought, owing in a measure to the scarcity of spot material. No change is noted in quotations, contract ammonia holding at $3.25 to $3.40 and spot ammonia at $3.40 to $3.65. These prices are on a basis of f.o.b. producers' plants.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Tuluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.65

Contract

Sulphate of ammonia	3.25 to 3.40

Obituaries

COL. HENRY A. MARTING, aged 69, pioneer iron manufacturer and philanthropist, of Ironton, O., died Sept. 27, following an illness of several months. Colonel Marting suffered for many years, an operation for bladder trouble becoming necessary in the fall of 1916. This gave him temporary relief; but he was compelled to give up active business a year ago. At that time he retired as general manager of the Marting Iron & Steel Co. He was succeeded by a nephew, E. O. Marting, in the active management of the business, although he still retained the presidency and acted as chairman of the board.

Colonel Marting's first venture of consequence on his own account in the iron business, which he had learned in his youth was the Marting Iron & Steel Co., which he organized in 1899 at Ironton, with two blast furnaces to manufacture bessemer, foundry, malleable and basic pig iron. In July, 1912, Col. Marting effected a merger of a number of furnace properties in the Hanging Rock district, by which his company absorbed the Ironton Iron Co., Ironton, and the Lawrence Iron Co., Culbertson, O. This acquisition gave the company a total of four furnaces. To the development of these properties he gave his active efforts up to the time of his enforced retirement, due to ill health, two years ago.

Colonel Marting was known as Ironton's "grand old man" for his many civic activities and his pride in his native city. A new up-to-date hotel, the Marting, completed a few months prior to his death, was one of his many achievements in the public interest in Ironton. Too ill to attend the formal dedication services, he was presented at this time a loving cup by a committee of citizens.

George L. Follansbee, formerly treasurer of the Follansbee Bros. Co., Pittsburgh, died Sept. 20, at Hendersonville, N. C., where he had been since March, 1918, on account of ill health. Before becoming identified with the Follansbee Bros. Co., Mr. Follansbee was in the printing business and also was Pittsburgh manager of the American Type Founders Co.

Harry Bonnell, aged 64, long identified with coal and iron interests in the Mahoning valley district, died Sept. 20, at Cambridge Springs, Pa. Mr. Bonnell was born in England and came to this country as a boy. He was identified with the Mahoning Valley Iron Co., Youngstown, O., in its office for many years and when the Republic Iron & Steel Co. took it over,

COL. H. A. MARTING

he became affiliated with the latter company. He retired several years ago.

Calls Foster an I. W. W.

(*Concluded from page* 917)

1000 South Paulina street, Chicago, wherein they advocated "direct action," and sabotage.

"Senators will please note," Senator Pomerene said, "that William Z. Foster, in his position as organizer of the steel men, seems to be following out the program so clearly set forth in his letter which I read. He is an I. W. W., as appears from the reading of his letter.

"With the feeling of unrest prevailing as it is today, for men of the type of Foster, who has no respect either for the law of God or the law of man, to be placed at the head of a labor organization, or a movement in the interest of labor, shocks one's reason. All that men of that kind can do or will do is to ruin the cause of labor."

Foster was also condemned by Representative Cooper, Youngstown, O., a member of the Brotherhood of Locomotive Engineers and a strong supporter of organized labor, whose remarks were loudly applauded. Foster was classed by Mr. Cooper with agitators who are attempting to push themselves to positions of prominence in the American Federation of Labor.

"Many of these men," he asserted, "have not done an honest day's work in their lives and if reports are true they are stirring up a class hatred which will widen the gap between employer and employe instead of bringing them closer together."

Kahn Demands Palmer Prosecute Foster

Washington, Sept. 30.—In a conference with Attorney General Palmer last Wednesday, Representative Julius Kahn, California, chairman of the house committee on military affairs, urged federal prosecution of William Z. Foster on the grounds that he is inciting revolution in the United States. This was while senators and representatives were denouncing Foster as an enemy of the government.

Mr. Kahn said he was assured the department of justice has complete records of Foster's activities in the past and that his work in the steel strike is under observation. He declined to say whether the attorney general contemplated any federal action against Foster.

The demand for prosecution, Representative Kahn said, was based on Foster's pamphlet of "Syndicalism," a copy of which Mr. Kahn placed before the attorney general.

"Mr. Foster's writings clearly show that he advocates murder, the destruction of property and a general strike, all for the purpose of enforcing his views on the country," Mr. Kahn said. "There is little doubt but that he favors the establishment of a soviet government in the United States, and advocates strike after strike until the workers have practically confiscated the properties where they are employed

"In my mind, Mr. Foster's radical writings are responsible for the recent killings in the steel district. I suggested to Mr. Palmer that Foster should be charged with being 'an accessory before the fact.' Mr. Palmer replied if such were the case it would be a matter for the state to prosecute and not the federal government."

Fig. 1—The ground upon which the blast furnace of the Weirton Steel Co. is located adjoins the Chester branch of the Pennsylvania railroad near the main line between Pittsburgh and Steubenville, O. The Ohio river forms the north boundary of the plant, the general yard level being 88 feet above the river

Wierton Steel Builds Modern Furnace

WEST VIRGINIA'S fifth blast furnace, the first to be erected outside of the Wheeling-Benwood district, recently was put in operation at Weirton by the Weirton Steel Co. Ground was broken July 22, 1918, and in 364 days or July 21, 1919, the furnace was lighted and the blast put on. The output at present is being marketed but when the company's new steel plant, which will include seven open-hearth furnaces and a 40-inch blooming mill, is completed, the product of the furnace will be used by the company.

The furnace was designed by Freyn, Brassert & Co., Chicago, in conjunction with the engineering department of the Weirton Steel Co. and was erected by J. J. Mohr & Son, Chicago. The stack, which is rated at 600 tons capacity, is 22½ x 92 feet. Ten cast-iron columns support the furnace proper. Hot blast is supplied through ten tuyeres which are so situated in the bosh that a tuyere is centered between every two columns. This arrangement affords plenty of freedom to the furnacemen when charging tuyeres, coolers or blowpipes and presents a neat appearance. The furnace at present is being blown with eight 12 x 6-inch and two 15 x 5-inch tuyeres, one of the latter size tuyeres being placed over the iron notch for the purpose of maintaining a long hole. The other 15 x 5-inch tuyere is placed 180 degrees from the iron notch in order to equalize the blast penetration of the same size tuyere in the front of the furnace.

All tuyeres and bosh plates are supplied with water from a manifold which encircles the furnace at a point about 2 feet above the bustle pipe. This manifold is supplied with water through two feed pipes each of which is equipped with an Elliott-type basket strainer. All valves for controlling the amount of water fed to the tuyeres and bosh plates are screwed into the manifold at the side opposite the furnace and are handy for the watertender to operate. The water after passing through the tuyeres and bosh plates is discharged into a cast-iron trough which also encircles the furnace just

FIG. 2—CINDER IS TRANSFERRED FROM THE GRANULATING PIT TO THE VARIOUS HOPPER CARS BY A CLAM-SHELL BUCKET SUSPENDED FROM A MONORAIL CRANE. THE LATTER IS ALSO USED FOR CONVEYING MATERIAL SUCH AS COKE DUST, CLAY, SAND, ETC., FROM OUTSIDE STORAGE BINS TO THE CAST-HOUSE FLOOR

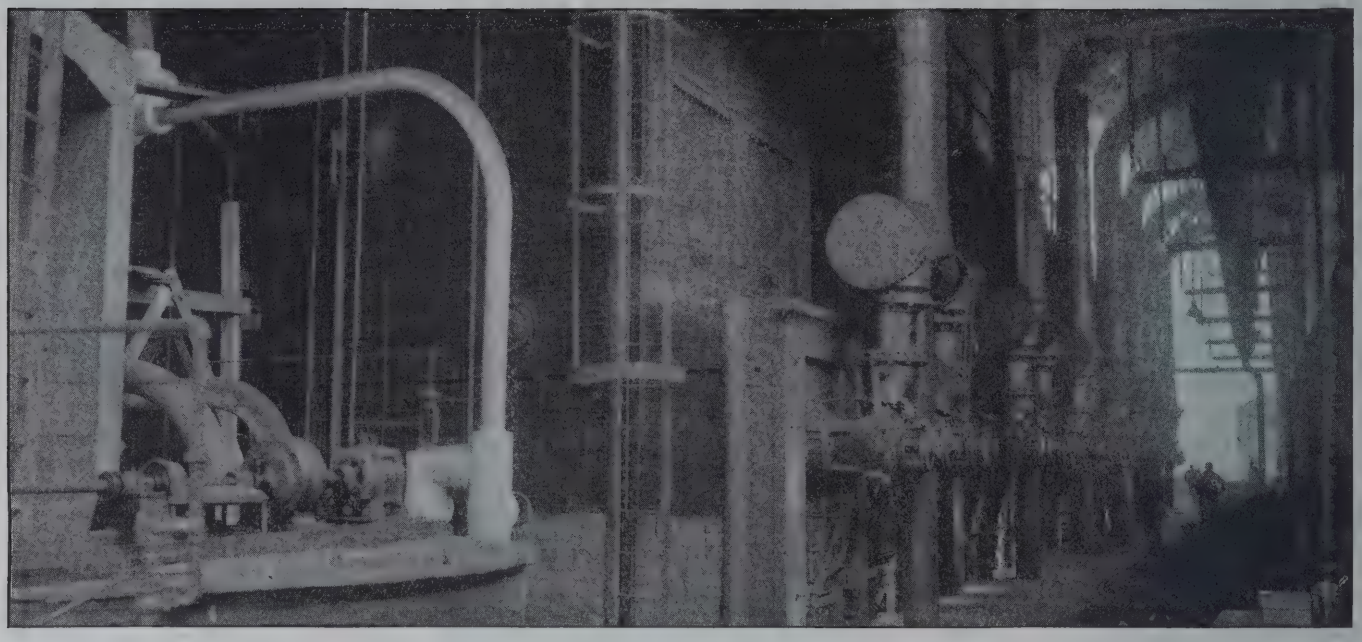

FIG. 3—4800 BOILER HORSEPOWER IS PROVIDED BY ONE COAL-FIRED AND SEVEN GAS-FIRED, THREE-PASS BOILERS WHICH ARE BUILT FOR 231 POUNDS PRESSURE AND 125 DEGREES SUPERHEAT

above the manifold. On all manifold valves and on all pipes discharging into the trough are attached perforated steel plates which indicate the number of the tuyeres, the coolers and the bosh plates respectively. By means of this arrangement there is no excuse for the watertender turning the wrong valve when it is necessary to shut off the water from any particular tuyere, cooler or bosh plate. A trough is provided around the furnace shell at the extreme top of the bosh so that if it becomes necessary to install sprays around the shell should a hot spot develop, the discharge water will be taken care of properly without dripping down on the furnace floor.

A Killeen-type skimmer separates the slag from the iron during the cast, the iron flowing into 75-ton ladles placed at the end of the cast house and the slag into a granulating pit. Two ladles are provided. These rest on standards with the pouring lips facing each other. The ladles are tilted separately by means of a 55-ton traveling crane, the metal flowing into a trough which discharges into the individual molds of a pig machine. The usual splashing of metal during the pouring process is absent at this plant owing to the fact that a distance of about 24 inches is maintained between the receiving trough and the pouring lip on the ladle. The pig machine is of the Uhling two-strand type and was built by the Pittsburgh Coal Washer Co., Pittsburgh.

The slag is granulated in a concrete pit which is built inside the cinder-yard runway. Provision, however, has been made for flushing the slag into ladles whenever it becomes necessary. The slag is transferred from the granulating pit to railroad hopper cars by means of a grab bucket suspended from a monorail crane. The loading equipment was built by the Pawling & Harnischfeger Co., Milwaukee. Adjoining the cin-

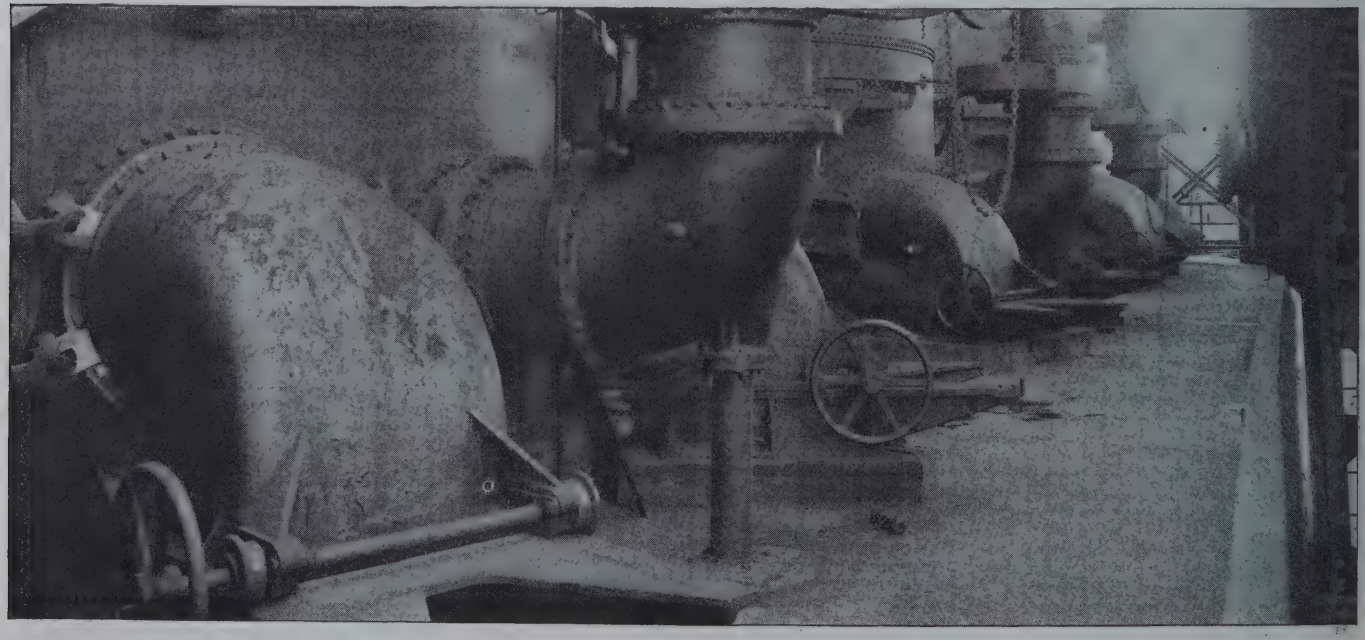

FIG. 4—EACH STOVE IS EQUIPPED WITH TWO CHIMNEY VALVES WHICH CONNECT WITH AN UNDERGROUND FLUE LEADING TO A 9½ x 225-FOOT CONCRETE CHIMNEY

der-yard runway is a yard equipped with several bins for storing sand, clay, coke dust, etc., for furnace use. These materials are transferred to the furnace floor by means of the cinder-yard crane which is switched onto a monorail built over the storage bins and extending into the cast house.

After the iron has been cast from the furnace the iron notch is plugged with clay by means of a Brosius-type steam gun, the operation of which is controlled by a single workman stationed to one side. The operator by manipulating four steam valves raises the splasher plate, swings the clay gun into the iron notch, brings the dogs down on the yokes of the clay gun and forces the gun load of clay into the hole. After additional clay is forced into the iron notch, the furnace foreman by means of electric signaling system notifies the blowing engineer to deliver the normal quantity of blast. The blowing engineer acknowledges this order by pressing a button which causes an electric horn, installed at the furnace, to blow. A telephone system is being installed between the engine room and the furnace for use in case the electric-signal system should fail at any time. The furnace may be rodded, that is, the height of the stock may be determined, either from the stockhouse or the furnace floor.

Handling of Raw Materials

At the northeastern end of the plant, the stove foundation, trestle and gas mains have been built so that whenever conditions warrant, additional furnaces can be built without disturbing the operation of the present one. Ore, coke and limestone are brought up over the trestle, which supports three railroad tracks. Coke and limestone are dumped directly into bins while the ore either is dumped directly into the various bins or is stocked in piles near the trestle. The stocking is done by means of two yard cranes each of which are equipped with a 40 cubic-foot grab bucket. The cranes were built by the Brown Hoisting Machinery Co., Cleveland. They are also used for charging ore from the stock piles into the bins directly or loading a 50-ton, electrically-operated, transfer car which distributes the ore to the respective bins.

Sixteen bins are provided. They are all built of concrete with the exception of the coke bin which is built of heavy boiler plates securely riveted together. Ten bins are set aside for storing ore, four for limestone, one for scrap and one for coke. The ore bins are lined with wood, the limestone bins with cast-iron plates and the scrap bin with steel rails. Ore and limestone are transferred from the bins to the skips by means of an electrically-driven scale car equipped with a dial recorder. Two cars are provided, one being set aside as a spare. They were built by the Atlas Car & Mfg. Co., Cleveland. Each is of 100 cubic-foot capacity.

The coke bin which is built over the skip pit, is provided with two chutes, one for each skip. The slide is discharged over chutes into railroad hopper cars for steel-plant or furnace use. The coke-breeze elevating and storing system was built by the De Pere Mfg. Co., De Pere, Wis.

Stock is elevated to the top of the furnace in skip cars which are operated by means of a hoisting engine built by the Lidgerwood Mfg. Co., New York. The drums, around which the skip cables wind, are connected through reduction gears to a single 200-horsepower Westinghouse motor. The skip-control equipment

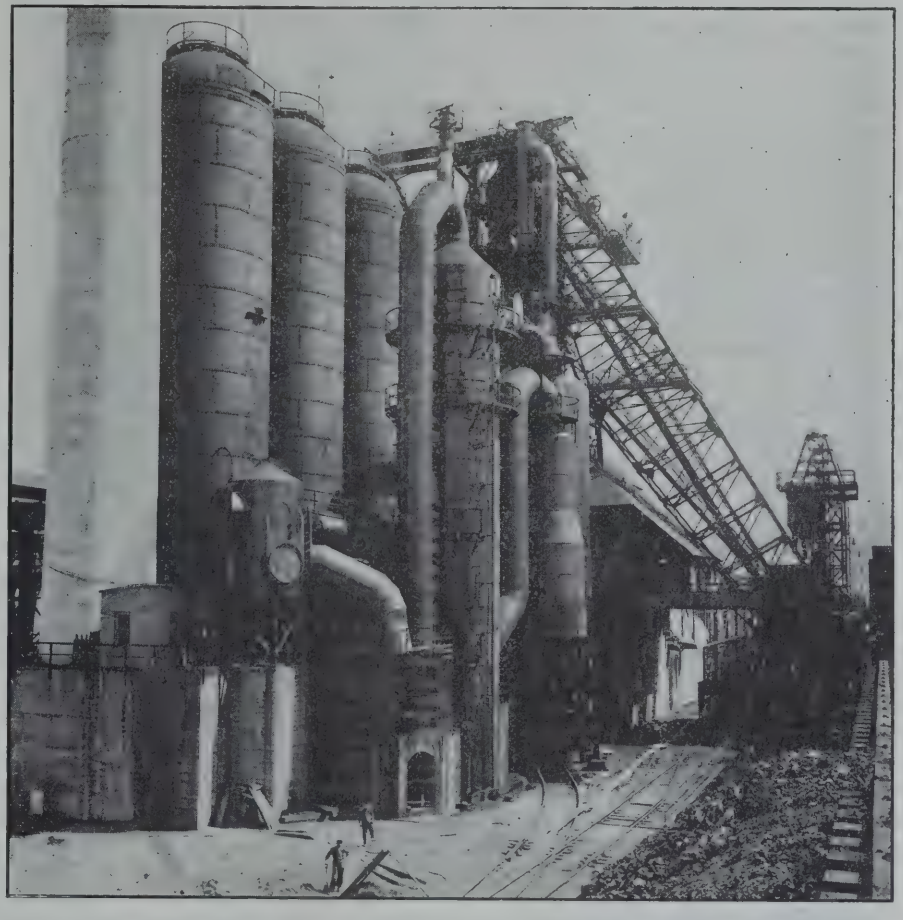

FIG. 5—VIEW FROM THE TRESTLE SHOWING THE GAS-CLEANING SYSTEM; SELF-SUPPORTING, CANTILEVER-TYPE, DOUBLE-TRACK SKIP BRIDGE; AND AUTOMATIC COKE-BREEZE SKIP STRUCTURE AND OVERHEAD HOPPERS

of each chute is arranged with four cascade-type screens, each having a series of 1¼-inch slots placed in a staggard position. The coke-bin doors are operated by means of compressed air. When coke is being charged into the skip, the breeze passing through the screen falls into a hopper underneath. This hopper discharges into a skip which elevates and discharges the breeze into a comman receiving hopper near the top of the trestle. The discharge door of the hopper underneath the coke-bin chutes is closed automatically by the skip when it begins its upward travel and is opened automatically when the skip returns for its load. The breeze from the common hopper was built by the Cutler-Hammer Mfg. Co., Milwaukee. The skip engine is housed in a building directly under the skip bridge. The furnace top is of the stationary type. The double-bell system is used for dropping the charge into the furnace. Both bells are kept closed by means of counterweights located in the skip-engine house and are opened by means of compressed air taken from the cold-blast main. If it is desired to open the bells while the blast is off the furnace, compressed air from another source cuts in automatically.

Outrigger beams have been built on top the furnace and are used for dismantling the top prior to relining the furnace. The gas passes out of

the furnace through four offtake pipes arranged 90 degrees apart. These offtake pipes combine into four uptake pipes, two of which are surmounted by Baer-type safety valves for the purpose of reducing the amount of stock thrown out of the furnace during a slip. Near the top of the offtake pipes are individual downcomer pipes, each two of which converge into one pipe.

The gas enters a secondary dust catcher tangentially where it is subjected to a whirling motion. This action relieves the gas of considerable more dust. After this stage of the cleaning process, part of the gas is passed through a large main to the boilers where it is used for generating steam. The remaining gas is passed into a Brassert-type washer where practically all of the dust is eliminated. It is then passed into a drier which extracts considerable moisture and entrained water. The gas mains connecting the dust catcher, whirler, gas washer and drier are equipped with goggle valves for shutting off the gas when necessary and with safety platforms near all elevated steam and water valves.

Three, 2-pass, side-combustion stoves serve the furnace. The checkers in each stove are 3½ inches square and together with the combustion chamber brick offer 95,000 square feet of heating surface. Each stove is 22 x 100 feet and is equipped with a Birkholtz-Terbeck gas burner and a Mathesius-type hot-blast valve. A 4-inch pipe is tapped into the head of the stove gas main near the furnace, and, by an arrangement of valves, is used either as a washout line or as an outlet for gas which is to be used for drying newly-lined ladles. The products of combustion leave the stove through two doors, pass through a tunnel to a 225-foot concrete chimney and are exhausted into the air. The snort valve and all stove blow-off valves are connected to the chimney. By means of this arrangement, the roar, which is noticeable at many furnaces when a stove is taken off the furnace to be put on gas or when the blast is emitted through the snort valve, is dispensed with. The cold-blast main is equipped with a relief valve which opens automatically when the pressure of the blast increases above 25 pounds per square inch.

Blast is supplied the furnace by means of a cross-compound, steam-blowing engine, a similar unit being held in reserve as a spare. The engines were built by the Mesta Machine Co., Pittsburgh. The average operating speed at present is from 75 to 80 revolutions per minute.

The power-house is built of buff brick and houses the pumping equipment and one 7500-kilowatt generator which was built by the General Electric Co., Schenectady, N. Y. The generator is driven by a Curtis-type steam turbine. The power house is served by a 20-ton crane built by the Champion Engineering Co., Kenton, O. Steam is supplied to the power house at 225 pounds pressure per square inch and 100 degrees superheat by eight 603-horsepower boilers, seven of which are gas-fired and one stoker-fired. The stoker-type unit is equipped with a burner built by the Combustion Engineering Corp., New York. All units are equipped with superheaters and soot blowers. The products of combustion are exhausted into the air through a concrete stack 225 feet high. Along the charging side of the boiler house are coal bunkers which are charged from outside the building by means of a yard crane and clam-shell bucket.

Serving the boilers is a water-softener plant which performs three functions, namely, softening, heating and filtering the water prior to its use in the boilers. This equipment was built by the William Graver Tank Works, East Chicago, Ind. All water used at the plant is taken from the Ohio river and is pumped through a 30-inch pipe into a Westinghouse barometric condenser built just outside the power-house building. This condenser operates in conjunction with the turbo generator and uses 8500 gallons of water per minute. The discharge water from this condenser flows into a cistern which has a holding capacity of 200,000 gallons of water. The reservoir is located in the basement of the power-house building. Water is pumped from here to the furnace for use in the cooling system and for cleaning purposes in the gas washer. Another pump supplies the blowing-engine condenser. The discharge water from this unit passes into a hot well and is pumped to the boilers department for steam generation and to the furnace for washup lines and the granulating pit. An 18-inch auxiliary supply pipe also connects the river with the cistern indirectly.

Officials of the Weirton Steel Co. include E. T. Weir, president; J. C. Williams, vice president and general manager, and D. M. Weir, vice president and secretary. C. H. Elliott is steel works manager, and H. E. McDonnell is blast furnace superintendent.

FIG. 6—PROVISION HAS BEEN MADE FOR INSTALLING AN ORE BRIDGE AND CAR DUMPER. AT PRESENT THE ORE IS STOCKED OR RECLAIMED BY TWO LOCOMOTIVE CRANES EQUIPPED WITH OUTRIGGER WHEELS AND 2-CUBIC YARD BUCKETS

Heat Treaters Hold First Meeting

Initial National Gathering and Exhibit at Chicago Brings Liberal Response From Metallurgists and Manufacturers—Many Papers Presented at Technical Sessions — General Officers Elected for One and Two Year Terms

FORMED one year ago in Chicago and in the interval having established nine chapters in the larger centers of the steel industry with more than 1000 members, the American Steel Treaters' society held its first convention and trade exhibition at Chicago, Sept. 23 to 27. The attendance reached practically 1000 daily at the exhibition and an average of 150 at the technical sessions.

Sixty-four exhibits were displayed in the Seventh Regiment armory by manufacturers of special steels, heating furnaces, alloys, supplies and apparatus essential to this branch of the steel industry. Among the exhibitors were the Crucible Steel Co. of America, the Chicago Flexible Shaft Co., maker of heating furnaces, the Interstate Iron & Steel Co., which recently entered the alloy field, the Ludlum Steel Co., P. H. & F. M. Roots Co., Joseph T. Ryerson & Son, the Vanadium Alloys Steel Co., Colonial Steel Co., Denver Fire Clay Co., Firth-Sterling Steel Co., Mahr Mfg. Co. and Swedish Crucible Steel Co.

Warns of Strike Dangers

H. H. Merrick, president of the Chicago Association of Commerce, gave the address of welcome and warned of the danger of the present era of strikes and the consequent loss of production. He said: "Somehow we must stop this talk of strike—the idea that a few men can tie up a great industry, that one man can justify himself in saying that the strike of the steel and iron workers is simply a warning that the American Federation of Labor may demonstrate that it has the power to strike. That sort of thing is absolutely wrong in this country. There may be evils in the trade, conditions among laboring men that require attention and adjustment. There may be such conditions in your own plant but all the world needs production today and we are the primary factor in production. In reality the trouble that brings about these strikes is occasioned by the agitator, the man who doesn't work, who hasn't worked for years and who doesn't intend to work in the future. Then, again, there is the weak-kneed sister who yields to every current of the wind, as in the case of the Adamson law, 'let's give up this and tomorrow give up that and next week let's surrender that.' Out of that comes disaster and chaos."

The election of officers resulted in choice of men from various sections of the country, half being chosen for one year and the remainder for two years, to give an alternation in elections in the future. T. E. Barker, production manager of the Miehle Printing Press & Mfg. Co., Chicago, was chosen president for one year. E. J. Janitzky, metallurgical engineer of the Illinois Steel Co., Chicago, was made first vice president for two years and D. K. Bullens, consulting metallurgist, Cann & Saul, Royersford, Pa., second vice president for one year. Arthur G. Henry, metallurgist for the Illinois Tool Works, Chicago, was re-elected secretary for two years. Directors for two years are H. G. Wiedenthal, vice president of James H. Herron Co., Cleveland, and A. F. McFarland, metallurgist for the Vanadium-Alloys Steel Co., Latrobe, Pa. Directors for one year are J. Fletcher Harper, Allis-Chalmers Mfg. Co., Milwaukee, and J. O. Pollak, secretary Pollak Steel Co., Cincinnati.

The technical sessions brought out a large number of papers on various phases of heat treating for various purposes, temperatures, design, selection of steels, failures, annealing, fuel economy and pyrometry.

Thursday evening the sessions closed with a banquet and entertainment at which addresses were made by John W. O'Leary, of Chicago, counsellor of the United States Chamber of Commerce; Dr. Henry Marion Howe, dean of American metallurgists, and Joseph W. Richards, professor of metallurgy of Lehigh university. Dr. Howe was present at all the sessions of the society and aided much by his discussions.

As an added feature, giving practical application of heat treating methods, a number of Chicago companies arranged for those in attendance at the meetings to visit their plants. This gave the opportunity to the various members of the society to observe different practice and the application of new principles as worked out by various institutions carrying on heat treating work in a commercial way.

During the meeting more than 100 additional members were enrolled and applications were made for instituting several additional chapters in centers of steel working industries.

Sheet Extensions Let

Contracts for the new extensions of the company's capacity for the production of highly finished specialty sheets have been awarded by the American Rolling Mill Co., Middletown, O., to the Westinghouse, Church, Kerr & Co., Inc., New York City. This contract covers the building and part of the equipment. The balance of the equipment also has been contracted for. It is expected that the output of the new mills will be ready for the market during the second quarter of 1920. The increase in the capital stock of the company by $20,000,000 par value of 7 per cent debenture preferred stock as recommended by the directors, which was approved by the stockholders at a recent meeting, is to cover the cost of the increased capacity and to provide additional working capital. This stock has been offered to the common stockholders at par and to the public through Cincinnati and New York bankers. The common stockholders of record Aug. 19 are offered 10,000 shares of the present common stock at $25 par value per share in the ratio of one new share for each four shares held on that date. It is expected that the rights to the common stock will be taken up by the stockholders and that a large proportion of the preferred stock will be disposed of in a similar manner.

Steel Suit Scheduled

Washington, Sept. 23.—The government dissolution suit against the United States Steel Corp. has been scheduled as the sixth case in the new docket to come before the October term of the Supreme court for argument and perhaps will be heard about the latter part of that month. No new brief is to be presented by the department of justice, it is said, whose chief argument will be made by Judge Ames, who succeeded G. Carroll Tod as assistant attorney general.

Engineers Convene at St. Louis

Association of Iron and Steel Electrical Engineers Holds Thirteenth Annual Convention—Electrical Problems of Vital Interest to the Iron and Steel Industry Discussed—Future Calls for Solution of These Problems

ALTHOUGH but 30 years have elapsed since the first electric installation was made in a steel mill, the importance of this form of motive power was evidenced at the thirteenth annual convention of the Association of Iron and Steel Electrical Engineers, held in St. Louis, Sept. 23 to 26. Interest was shown not only in the papers which were presented but also in the display of electrical apparatus, inaugurated at the St. Louis convention.

"The keynote of the Association of Iron and Steel Electrical Engineers," said D. M. Petty, retiring president at the annual banquet, "is co-operation. The object of this association is the advancement of the application of electricity to the iron, steel and allied industries by the co-operation of its members. The means that have been employed to attain this end are the presentation and discussion of technical papers in section meetings.

"Sections have been formed in Birmingham, Ala., Chicago, Cleveland, Philadelphia and Pittsburgh. One of the great advantages of these section meetings is that foremen and assistant superintendents, who cannot go to the annual conventions, can easily attend these meetings. The good ideas that these men carry back to their plants tell in their daily work. Another means of furthering the art of electrical engineering is referred to as committee work. First is the educational committee, which has rendered several reports covering the training of electricians and the men in the mills who handle electrically operated apparatus; second is the electrical development committee which is on the lookout for new methods and apparatus of interest to the industry; third is the safety committee, which in 1912 became of such importance that from it the National Safety council was inaugurated; fourth is the electric furnace committee and fifth is the standardization committee, which has during the past few years made a strenuous effort to simplify the problems of spare parts for motors, controllers and similar devices.

"The third means by which the association advances the art is the bringing together of the men who are striving with the problems of increasing production, lowering costs and improving the quality of the plant product. The association must help the electrical engineer of the industry to do his work better. That we have not failed is shown by the remarkable growth of our organization."

Philip Stremmel, superintendent of the National Enameling & Stamping Co., Granite City, Ill., who during the past year conducted a school for safety engineers in connection with the St. Louis safety council, spoke on safety and the great advance it had made in the steel industry. He pointed out that the safety first movement was first instituted in steel mills. He stated that loyalty on the part of steel mill employes was largely due to their appreciation of the efforts made by mill operators to institute and maintain safety first work. Other speakers at the banquet were Senator Selden P. Spencer, B. W. Wilson, newly elected president of the association, Professor Karapetoff, Cornell university, Clarence Howard, president of the Commonwealth Steel Co., who presided as toastmaster, and Edgar Gagenbach, industrial commissioner of the St. Louis chamber of commerce.

Discusses Safety Problems

Proceedings of the opening session when officers were elected and official and committee reports received, were outlined on page 816 of THE IRON TRADE REVIEW for Sept. 25.

Discussion of the report of the safety and educational committee brought out the suggestion that safety should be considered before tonnage in all cases and that it is more practicable to teach men what to do than what not to do. One plan is to have foremen meet at frequent intervals to discuss accidents and to formulate means for avoiding them in the future.

A joint paper on "Organization of the Electrical Department in the Iron and Steel Industry" embraced the following subjects: Inspection and operation of electrical apparatus, by J. A. Morgan and J. J. Booth; educational training for electrical employes, by B. A. Cornwell; Electrical repair shops, by C. A. Menk; storeroom and spares, by T. E. Tynes, and records and tests by R. B. Gerhardt.

In the discussion that followed, the point was brought out that periodic tests should be made to see that insulation on important installations is efficient enough not to break down in practice and that these tests are not always carried out as often or as thoroughly as they should be. Because a motor has run for 10 years, it was stated, is no sign that it is in condition to run another 10 years. An actual breakdown test was strongly recommended in testing insulation as resistance tests do not always show if the insulation is adequate to withstand a maximum load. A good test was said to be 1¾ times the normal voltage.

Interest was shown in the discussion of two important subjects: The settling of disputes among the mill employes and automatic devices for calling important department heads who were away from their offices.

A personnel foreman, it was stated, is an advantage in hiring men. He is in close touch with the men and thus is in a position to gain their confidence. When a workman has a dispute with his foreman he can go to the personnel foreman and if these two heads cannot settle the difficulty, it is then taken to the general superintendent.

Professor Karbpetoff spoke on acoustic signals for calling department heads who are away from their offices. He has made an exhaustive study of such systems and predicts that in the near future they will be more generally used. He emphasized the difficulty of estimating the cost and trouble involved in cases where important executives cannot be readily reached. He cited a case of one steel mill executive who stated that a code calling system made the whole plant become his office. The various kinds of calls, whistles, bells, gongs, etc., that were used were explained. It was stated that in cases where high pitch sounds are in evidence, a low pitch call should be used and vice versa.

Professor Karbpetoff pointed out that such systems involve study and research work to adapt the necessary apparatus to different plants. Mistakes were often made, he said, because the sounds used were too loud, for while they must be audible they must not be discordant.

W. S. Hall, electrical engineer, South works, Illinois Steel Co., Chicago, presented a paper on "Alternating vs. Direct Current Motors for Rolling Mill Table Drives." This

paper set for that the adoption of alternating current motors for this class of drives would, in all probability, receive more attention in the future than it had in the past. The paper contained many interesting examples of both types of drive, together with cost figures in percentage for each type of installation. The illustrations described were for front roughing table, back roughing table, sheet bar mill roughing table and front mill table for a 132-inch mill. In the discussion, J. J. Ash stated that recent English installations involving both types of motors were giving excellent results.

H. D. James, control engineer for the Westinghouse Electric & Mfg. Co. read a paper on "Recent Improvements in Industrial Control." This paper described electric controllers of the magnetic contact type. He set forth that the electric controller has passed through the experimental stage so that at the present time it is reliable and well understood. It was stated that an exhaustive study of the design of magnetic controllers has enabled the engineer to make improvements which reduce the wear and maintenance costs and decrease the liability to freezing or failure to operate.

It was stated that considerable work has been done toward standardizing this form of equipment and that if steel mill requirements for controllers of this type were more uniform, manufacturers could build them in large quantities. This would give the purchaser better prices and quicker deliveries. This paper was illustrated by stereopticon slides.

"Present Status of Electrical Furnaces in the Steel Industry," was outlined by the electric furnace committee of the association. It was pointed out that electric steel production is divided into two classes, steel for ingots and steel for castings. The discussion developed that there is little technical literature available on electric furnace reactions. On the subject of furnace lining thicknesses, it was stated that too thin a lining wasted heat while an abnormally thick lining limited the capacity of the furnace. It was pointed out that careful records of furnace performances should be kept so that definite rules could be formulated.

That much of the success of any electric furnace depends on the operator himself was another point developed. The operators, it was stated, should be carefully trained. The shape of the furnace also came in for discussion. It was stated that the furnace body should be of such shape as to give equal heat at every point. The subject of electric heat treatment was covered in a paper by C. A. Winder, industrial heating engineer, General Electric Co., Schenectady, N. Y. It was claimed that furnaces of this type are economical in operation and that their further adoption is bound to come. The paper described three kinds of furnaces: Horizontal semicylindrical, car type and rotary conveyor type.

"Overload Protection for Motors" was discussed by Paul M. Lincoln. He described a type of recording meter for giving a continuous indication and record of the value of the average current through, and its heating effects on, the motor. The author is a consulting engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. The discussion brought out that the device should help in the future design of motors, due to the fact that overloads at peak points are readily shown as the device gives an accurate check on the actual work accomplished. The meter furnished reliable data to determine just how different operators, working on different shifts, handled the same motor.

Gives Historical Sketch

Calvert Townley, president of the American Institute of Electrical Engineers, gave an interesting talk on the growth and development of electrical power as applied to the iron and steel industry. He pointed out that co-operation between the various electrical societies was necessary in deriving the greatest benefits.

A. G. Place, electrical engineer, Youngstown Sheet & Tube Co., Youngstown, O., read a paper on "Overhead Protection for Cranes." The paper dealt with the subject of protecting crane equipment from overloads and drew some interesting conclusions. In the discussion, it was brought out that protection devices should be made as "fool proof" as possible and that operators should be educated to the fact that protection devices should not be tampered with.

A paper illustrated with stereopticon slides and giving general specifications for alternating current motors for main roll drives, was presented by the standardization committee. The object of the specifications was to bring about a more uniform standard for motors of this type. The specifications represented a year's research on the part of the committee in charge.

Papers also were presented on "Influence of Gear Ratio on Speed of Operation, Motor Heating and Contactor Wear in Auxiliary Steel Mill Drives," by J. E. Fries and a joint paper on "Present Status of Arc Welding in the Iron and Steel Industry," by A. Churchward, H. L. Unland, A. M. Bennett, R. A. Kinland, C. J. Holslag, R. M. Rush and A. M. Candy.

The exhibit was the first held by the electrical engineers and 34 manufacturers displayed electrical equipment. The displays were arranged in attractive booths adjacent to the convention hall. The following manufacturers took advantage of the opportunity to bring their products to the direct notice of the delegates: Edgar E. Brosius, Pittsburgh, single hoist charging machines; Keystone Lubricating Co., Philadelphia, greases; Benjamin Electric Mfg. Co., New York, lighting specialties; National Lamp Works of the General Electric Co., Schenectady, N. Y., light measuring devices; Reliance Electric & Engineering Co., Cleveland, generator sets; Thermoid Rubber Mfg. Co., Trenton, N. J., brake linings and friction disks; Marlin-Rockwell Corp., New Haven, Conn., asbestos insulated wire; Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., industrial control apparatus; Trumbull Electric Mfg. Co., Plainville, Conn., externally operated switches; Chicago Fuse Mfg. Co., Chicago, fuses; Economy Fuse Mfg. Co., Chicago, fuses; National Carbon Co., Cleveland, electrodes, carbon brushes and dry cells; Iron & Steel Equipment Co., Pittsburgh, steel plant equipment; Electric Products Co., Cleveland, battery charging motor generators; Electric Controller & Mfg. Co., Cleveland, controllers; Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., crane hoists; Cutler-Hammer Mfg. Co., Milwaukee, magnetically operated brakes for direct control service; Delta Star Electric Co., Chicago, substation equipment; Bussman Mfg. Co., St. Louis, fuses; Ludwig Homel & Co., Cleveland and Pittsburgh, meters; General Devices & Fittings Co., Chicago, electrical fittings; General Electric Co., Schenectady, N. Y., solenoid brake motors; Automatic Reclosing Circuit Breaker Co., Columbus, O., current breakers; V. V. Fittings Co., Philadelphia, insulators and fittings; R. D. Nuttall Co., Pittsburgh, flexible couplings for generator and motor connections; Lakewood Engineering Co., Cleveland, industrial tractors; Crouse-Hinds Co., Syracuse, N. Y., electrical specialties; Tool Steel Gear & Pinion Co., Cincinnati, gears; Pittsburgh Transformer Co., Pittsburgh, transformers; Moloney Electric Co., Windsor, Ont., transformers; Wilson Welder & Metals Co., New York, portable electric welding apparatus; Wood & Lane Co., St. Louis, fuses; Volk Mfg. Co., Westport, Conn., fuses.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE Chain Belt Co., Milwaukee, has announced plans for an important plant enlargement and improvement program, for which purpose the capital stock has been increased from $1,000,000 to $2,800,000. About two years ago the company purchased a 23-acre site in West Milwaukee, the limit of expansion at the original location having been reached. Contracts have been awarded for the first unit, 160 x 316 feet, which temporarily will be used as a concrete mixer assembling shop but will be converted into a foundry after a third unit has been provided early in 1920. The structural steel, amounting to 500 tons will be fabricated and erected by the Milwaukee Structural Steel Co. One 15-ton and two 5-ton electric cranes will be purchased in addition to other equipment.

The business now known as the Chain Belt Co., was started by C. W. Levalley in 1891 with a capital of $11,100. Capital stock was increased to $50,000 in October, 1895; to $500,000 in 1907 and to $1,000,000 in 1916. It commenced operations in a small shop. Subsequently larger quarters were secured. The present site was first occupied in 1902 when what now is the office building was erected. Since then additional buildings have been added until the entire site has been covered. In 1906 Mr. Levalley organized the Levalley Mfg. Co., later absorbed by the Chain Belt Co., as its gray iron department. A malleable iron foundry, 80 x 506 feet, was acquired in 1912 by purchase from the Prescott Malleable Iron Co., and since has been considerably enlarged. Prior to his death in 1918, at the age of 84, Mr. Levalley was chairman of the board having served as the company's president until retiring in 1916. William C. Frye now is president; C. R. Messinger, vice president and general manager; W. C. Sargent, secretary, and C. L. Pfeiffer is treasurer. Donald Fraser, who was vice president for many years, now is consulting engineer.

* * *

ANNOUNCEMENT has been made that the American Car & Foundry Co. will build a plant in Chicago to cost between $1,000,000 and $2,000,000, to be devoted to the manufacture of steel cars. The building is to be completed within six months, according to present plans.

* * *

STEEL for the new 4-story factory addition of the Hoover Suction Sweeper Co., North Canton, O., has been awarded to the Canton Bridge Co., Canton.

* * *

THE Barnes & Kobert Mfg. Co., manufacturer of bolts, which removed from Milldale, Conn., to New Britain, Conn., four years ago, has purchased the factory building it occupies.

* * *

WITH a complete line of mill supplies, an office and warehouse has been established at 197 High street, Boston, by the Boston Pulley & Shafting Co., a newly organized company. It is in charge of T. E. Toomey.

* * *

CONTRACTS have been awarded to the McLain-Carter Furnace Co., Milwaukee, for the installation of a 10-ton open-hearth furnace in the plant of the Black Steel & Wire Co., Kansas City, Mo.

* * *

ANNOUNCEMENT is made by the Wald Mfg. Co., Sheboygan, Wis., automobile parts and accessories, that it has increased its capital stock from $30,000 to $90,000. It will erect an addition to its factory to double its output.

* * *

EARLY in October, the Interstate Aluminum Co., Canton, O., expects to operate in a plant, 60 x 100 feet. The company recently was incorporated by Theodore Dobs and Robert Efflinger, that city, and Paul Barnard, J. W. Fenstermaker and W. Doolittle, of Massillon, O.

* * *

PLANT and equipment of the Loucks Iron & Steel Co., Roanoke, Va., recently were purchased by the Barr Co., Pittsburgh. The latter has begun work on dismantling the plant and selling the machinery and scrap. Equipment for a finishing mill, puddle mill, machine shop and pump house is included in the purchase.

* * *

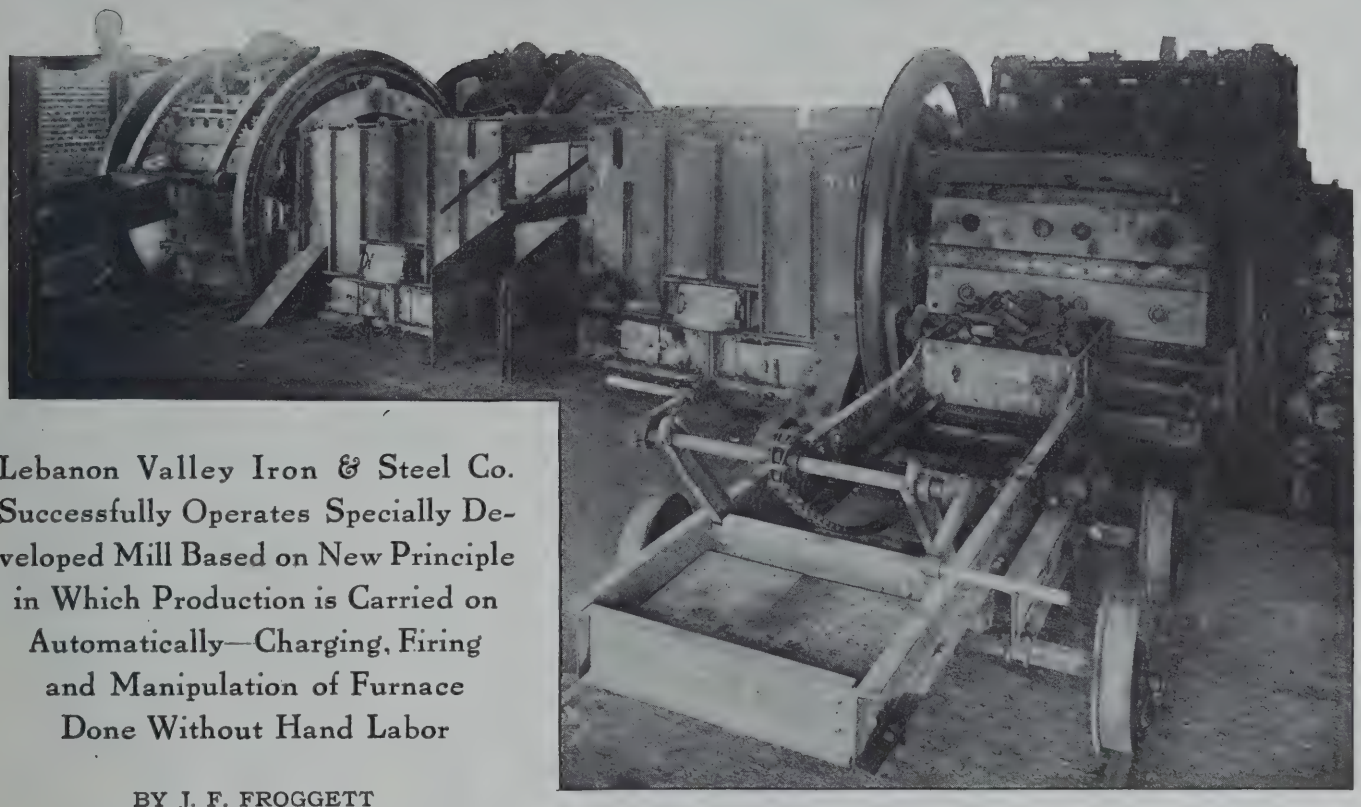
WORK on construction of a $300,000 addition to the plant of the Kansas City Structural Steel Co., Kansas City, has been started. The addition will increase the capacity of the plant 50 per cent and is expected to be in operation before the close of the year.

* * *

THE Giant Truck Corp. has bought the plant of the Chicago Pneumatic Tool Co., at Chicago Heights, Ill., and will utilize it in the manufacture of Giant trucks and motor cars. The former owners have removed its equipment to their Cleveland plant.

* * *

TO CARRY on a general business in iron, steel and metal scrap, the Commercial Steel & Supply Co. has been organized in Cleveland by A. A. Murfey and W. H. Dickey, formerly associated with the Ferrel-Dangler-Wilson Co., that city. The office of the new company is located in the Garfield building.



* * *

AT A COST of $3500 the Mt. Vernon Foundry Co., Mt. Vernon, O., has purchased a site for a new building from the Mt. Vernon chamber of commerce. A $20,000 building is contemplated and the Mt. Vernon Foundry Co. is to be reimbursed for the purchase price in three payments.

* * *

THE Uniform Co., Boston, recently was merged with the Blaw-Knox Co., Pittsburgh. The former company was organized to develop the general use of the system of concrete floor and roof construction designed by Nils F. Ambursen, formerly engineer of the Ambursen Hydraulic Construction Co. Mr. Ambursen now is chief engineer of the building forms department of the combined companies and W. L. Church, formerly of Westinghouse, Church, Kerr & Co., who has been associated with Mr. Ambursen for several years, is consulting engineer.

Making Bar Iron Mechanically

Lebanon Valley Iron & Steel Co. Successfully Operates Specially Developed Mill Based on New Principle in Which Production is Carried on Automatically—Charging, Firing and Manipulation of Furnace Done Without Hand Labor

BY J. F. FROGGETT

FIG. 1—ROTATING FURNACE SHOWING DOOR AND CHARGING MACHINE IN POSITION

YEARS of patient study, exercise of considerable ingenuity and expenditure of much treasure have been devoted to the problem of automatic production and finishing of iron and steel. The attainment of this end has been reached by the Lebanon Valley Iron & Steel Co., Lebanon, Pa., in the new wrought iron mill which it placed in active operation on Sept. 11. The company itself would be the first to disclaim having solved all the problems connected with automatic production of bar iron, but the success that has attended its efforts so far augurs well for future developments. It now is actually producing automatically and rolling with the least employment of hand labor muck bar and billets for the trade. The new mill is working smoothly and is bound to be a most important factor in the eastern bar iron industry because of the economies effected in manufacture of this product.

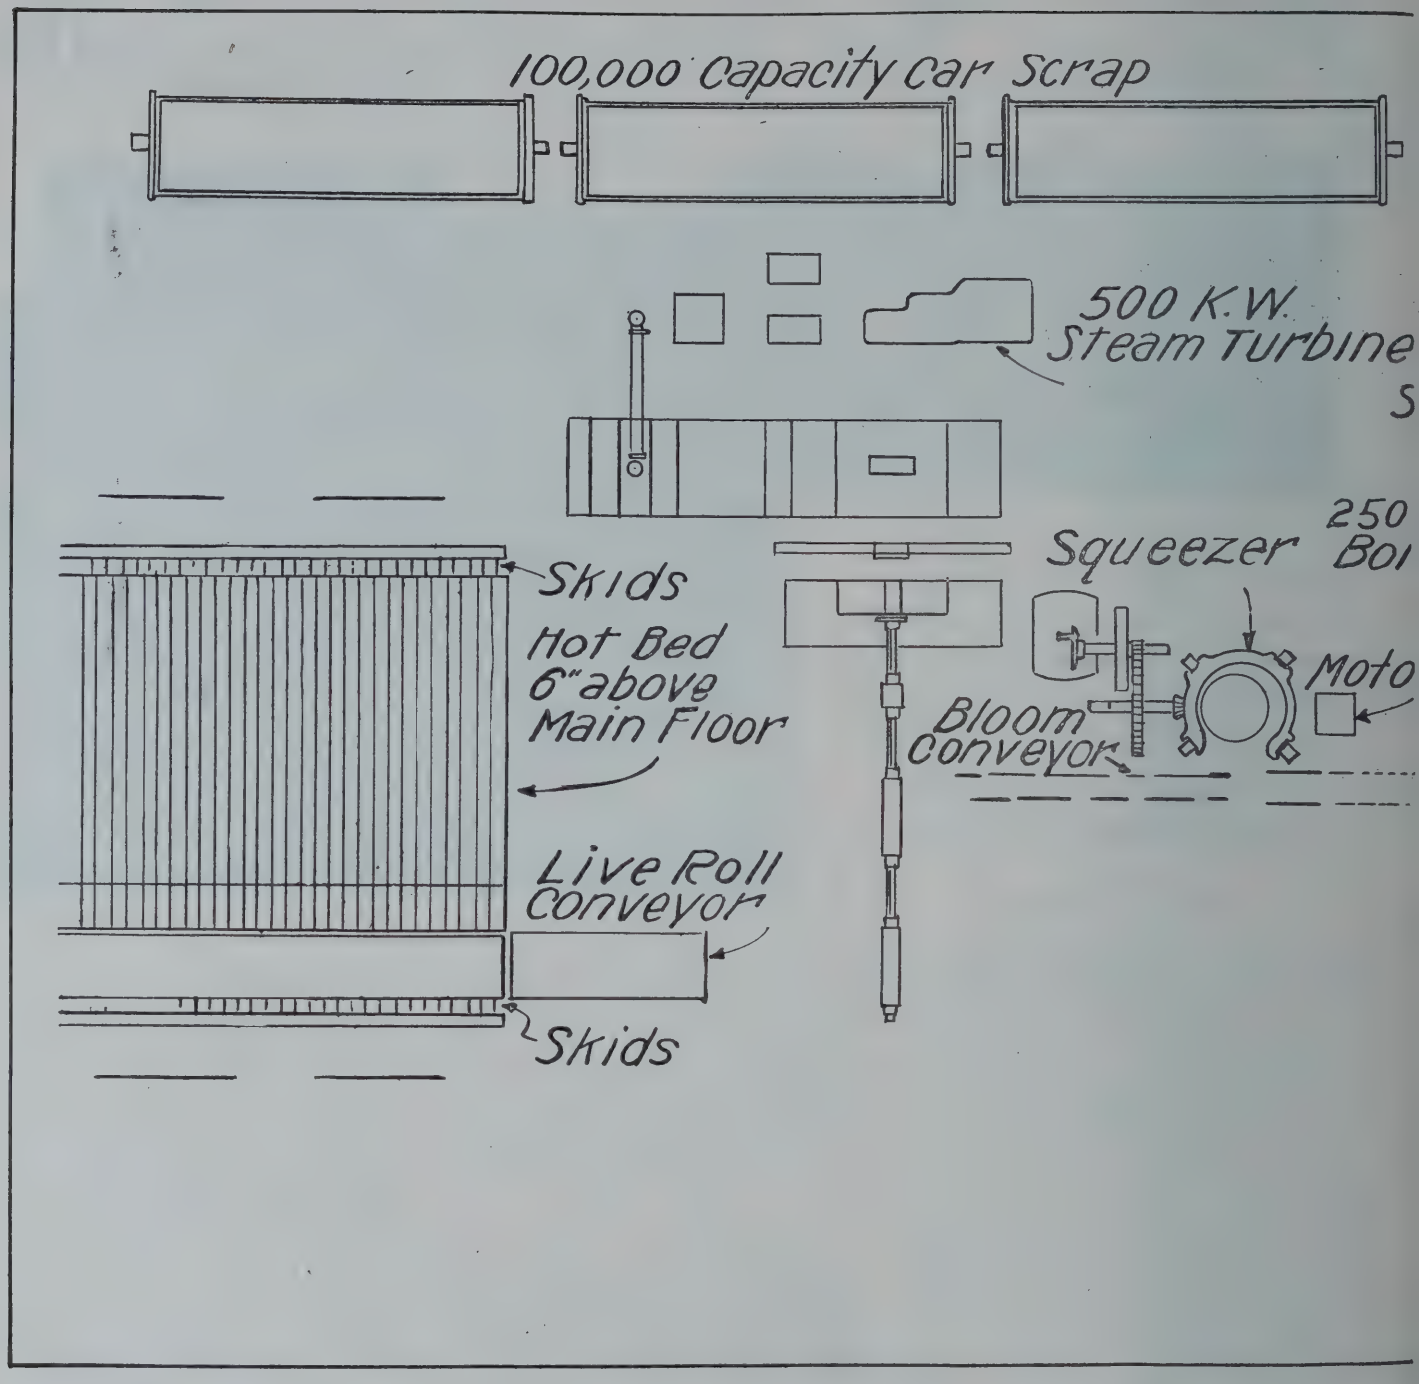
By some the Lebanon mill is denominated an automatic puddling mill, but this is not strictly correct since no attempt has yet been made to puddle pig iron in it. This likely will be attempted at some future time. So far, the mill may be described broadly as an automatic busheling mill. Scrap is employed, even the charging of the rotating furnace, firing and manipulation being done by the latest machinery of which some was invented and built by the Lebanon company itself. While the rolls are manned by hand roughers, yet electrically-driven machinery is employed everywhere to facilitate and supplement roughing by hand with the least expenditure of muscle and utmost relief from physical strain upon the workmen.

On Horizontal Axis Principle

Heretofore, efforts of inventors had been directed toward producing a mechanical puddler based upon the principle of a vertical axis for the rotating furnace. But this Lebanon furnace, invented and patented by Walter C. Ely, treasurer and general manager of the Highland Iron & Steel Co., Terre Haute, Ind., is based upon the principle of a horizontal axis which permits continuous process of further manufacture by means of machinery without a stop or radical change in direction of the moving unfinished product.

The main feature of the Lebanon company's theory in building the mill was to insure automatic operation of the furnace which heats the charge to welding temperature. The application of the principle of rotation to the furnace was not new except in its method of rotation as pointed out above. But the invention of the door of the furnace and its principle of opening and closing by means of an individual 15 horsepower motor attached to and revolving with the furnace itself was the ingenious feature. For by merely shifting this door, the ball of wrought iron is dropped upon a conveyor belt which moves it rapidly to the squeezers whence it is conveyed by another belt to the muck mill and the end of the bloom inserted into the rolls for the first pass.

Each of the eight rotating furnaces installed in the Lebanon plant is 7 feet long, outside measurement, 6 feet 4 inches in diameter overall. In general appearance it gives one the impression of an octagonal tumbling barrel such as is employed in cleaning castings in a foundry. The exterior of the furnace is constructed of cast-iron chills and the lining is composed of 9-inch standard magnesite bricks which at first required some dexterity to lay so they would hug the interior of the furnace. The firebox which feeds the furnace is not at all unlike the firing end of an ordinary reverberatory furnace, the hot gases passing over through a bricked flue into the revolving chamber and thence through another bricked flue into the waste gas chamber to a 250-horsepower Wickes water tube boiler thence through a stack 48



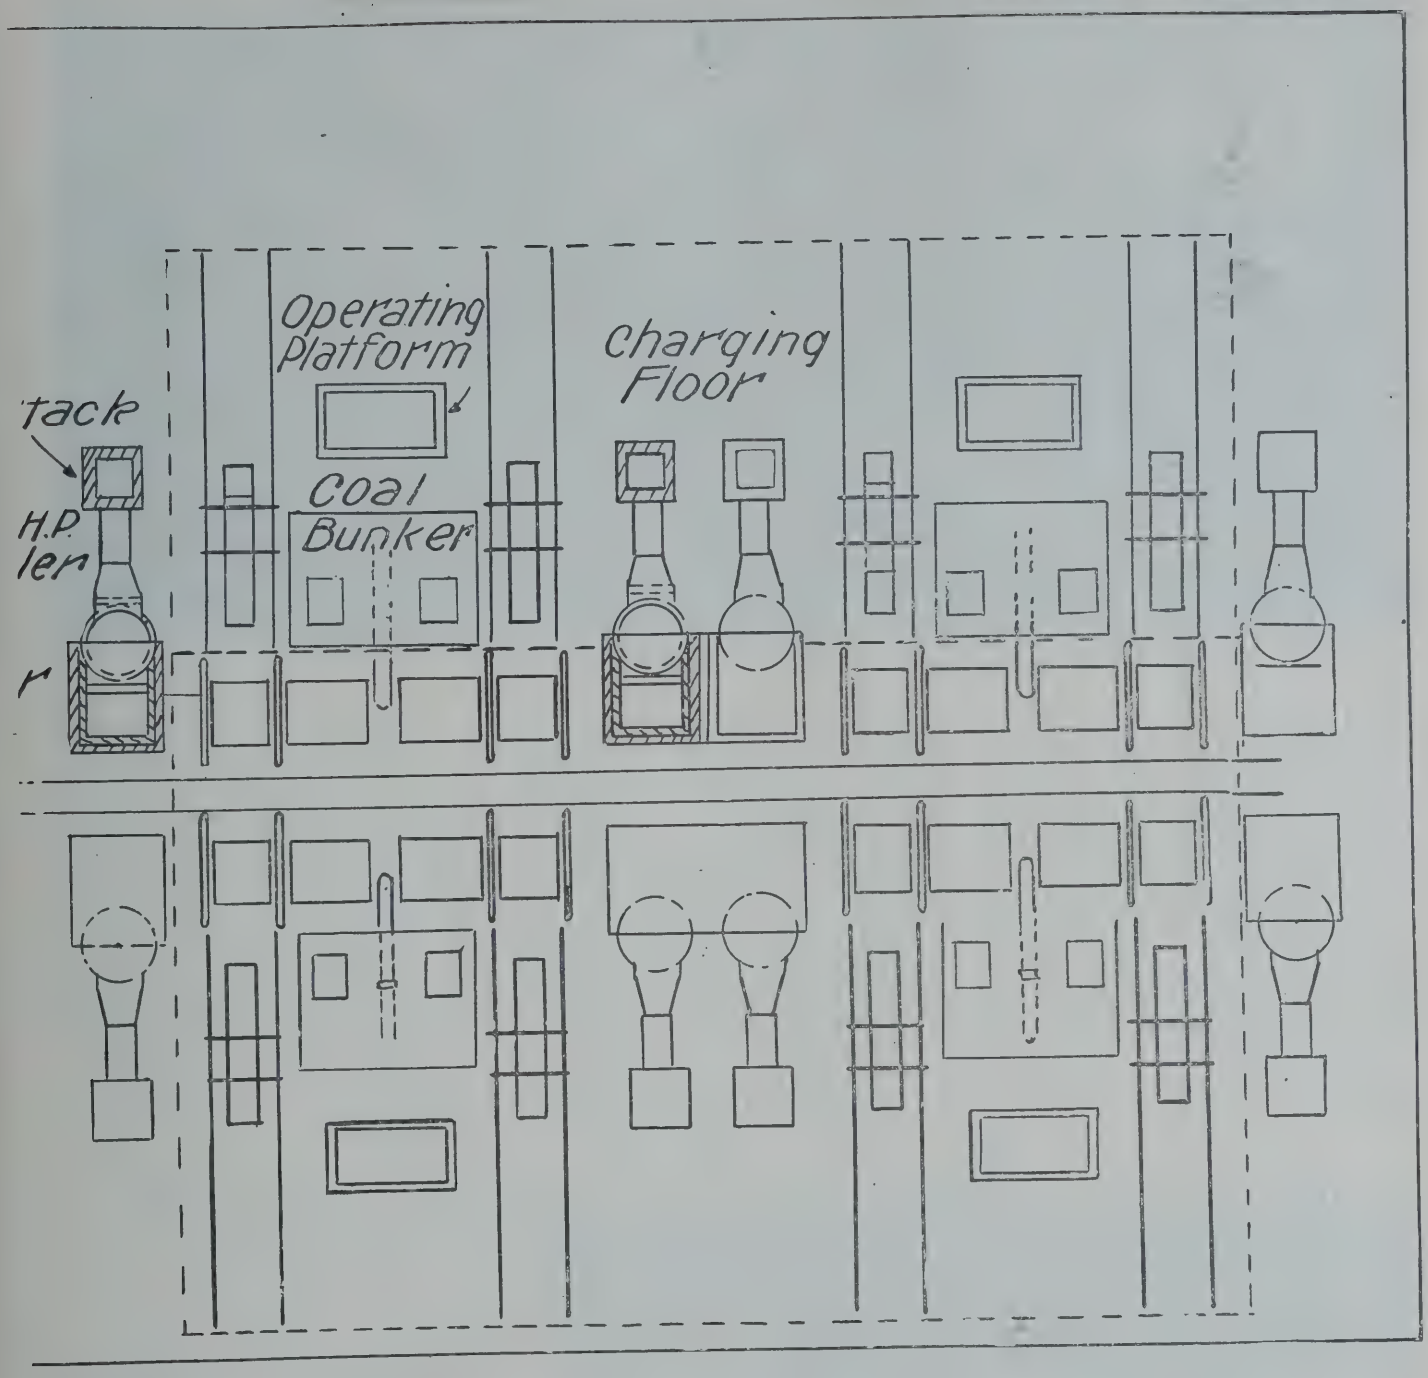


FIG. 2—LAYOUT OF NEW ROTATING FURNACES AND MUCK

inches in diameter and 110 feet high. Eight of these boilers attached to the eight furnaces furnish steam for the mill engines and turbine. The rotating furnace is mounted upon two 10-foot cast steel wheels or carrying rings propelled by two motor-driven 14-inch friction rolls. Two of these furnaces were in operation when the mill started, two others had been lighted while the other four had been completed and would be lighted within a few days. In one of them a crushed coal firing device had been installed after extensive and successful experiments conducted in the old heating mill of the company. It is proposed to install them at each of the eight firing boxes, thus doing away with hand firing. The firing device was invented, patented and built by Chief Engineer Charles S. Heffelfinger of the Lebanon company. It is shown at Fig. 6.

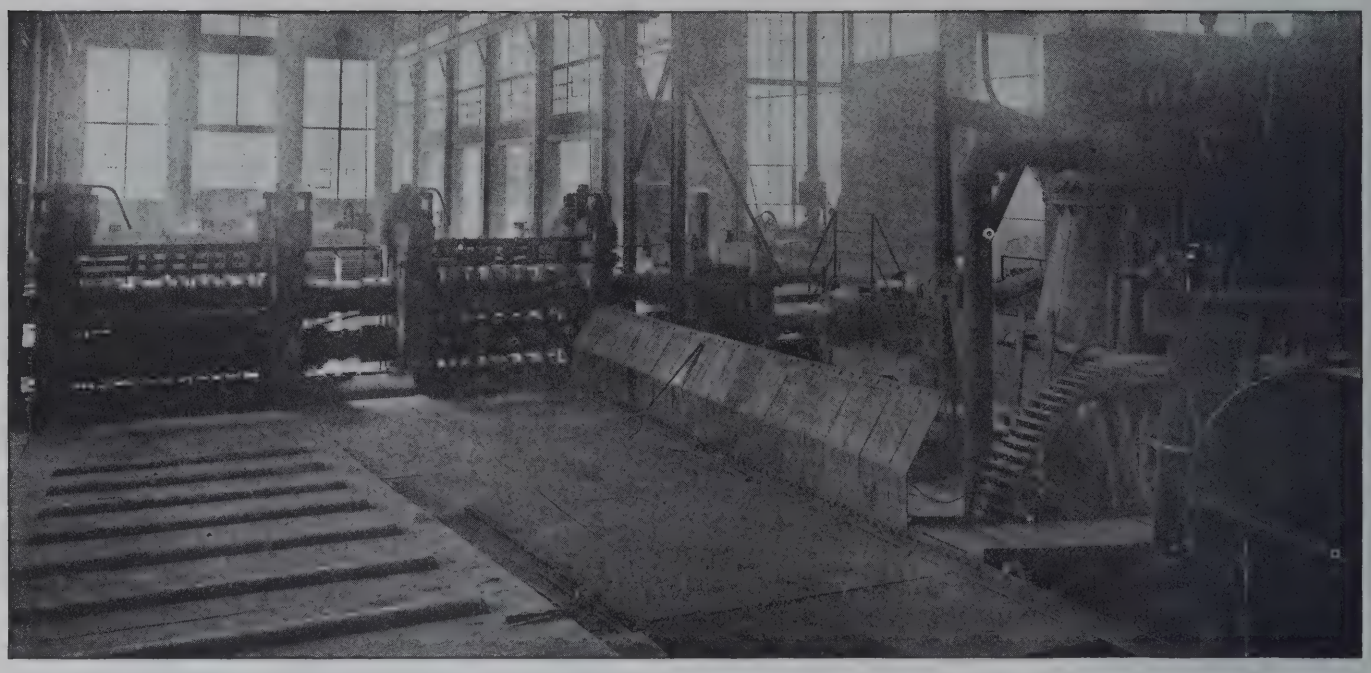
Each furnace produces five heats an hour and is designed to manufacture balls weighing from 600 to 1200 pounds each, depending upon the size of material ultimately required. It is figured that each furnace will consume 54 magnesite bricks monthly. When the heat has run its length, the furnace having revolved slowly in the meantime to round the charge into ball shape, the operator who controls the number of revolutions absolutely by means of an electric controller, halts the operation while the door of the furnace stands at the bottom and by means of another controller operating the 15-horsepower motor attached to the exterior of the furnace, he opens the door and the ball falls through upon a chute. By gravity it passes onto a belt conveyor which is 130 feet long and travels toward the squeezer at the rate of 400 feet per minute. This ball conveyor is a double-strand 4-inch pitch steel strap bushed chain to which are attached at intervals of 16 inches steel flat crossbars, 3 x 1 inches, traveling on T-rail tracks. When the ball has arrived opposite

MILLS OF LEBANON VALLEY IRON & STEEL CO.

the squeezer, it is discharged upon a pivoted stand resembling in general appearance a hod, which by gravity in turn dumps the ball into its proper position in the 72-inch all cast steel squeezer. This squeezer was designed by the Lebanon company but built by the Hunsicker Engineering Co., Lebanon, Pa., especially of larger size than ordinary to take in balls weighing up to 1200 pounds. It makes six revolutions per minute, and is driven by a 24 x 27 reversing vertical side crank steam engine with 8-inch steam pipe, also built by the Hunsicker company.

When the squeezer has discharged the bloom, the latter falls upon another belt conveyor which moves toward the rolls on a 5 degree incline, it being designed to take a bloom 9 inches in diameter 3 feet 6 inches long. This conveyor travels at the rate of 150 feet per minute. It consists of a series of steel pans ¾-inch thick with flared sides 1½-inch deep. Each pan is 5¾ inches long and 8⅛ inches wide at the top. The conveyor is shielded by a stationary protector of steel plates which is shown in Fig. 3.

The first pass in the rolls is initiated by the impetus received from the bloom conveyor and after that the bloom is roughed by hand labor as in the usual muck mill. The roughing mill consists of 22-inch, 3-high stands running 48 revolutions per minute and were turned by the Lebanon company from special designs for this mill. The bloom can be rolled down to a 2 x 2-inch billet if desired or an 8 x 1-inch flat for muck bar purposes. The material after rolling passes out by means of motor driven floor rolls onto the cooling bed which is built of 85-pound steel rails. The rolls are driven by a 30 x 60 right hand Allis steam engine with a 30-ton flywheel 22 feet in diameter. The roughing mill was built by the Lewis Foundry & Machine Co., Pittsburgh. The cooling bed which is 80 feet long and 33 feet wide is



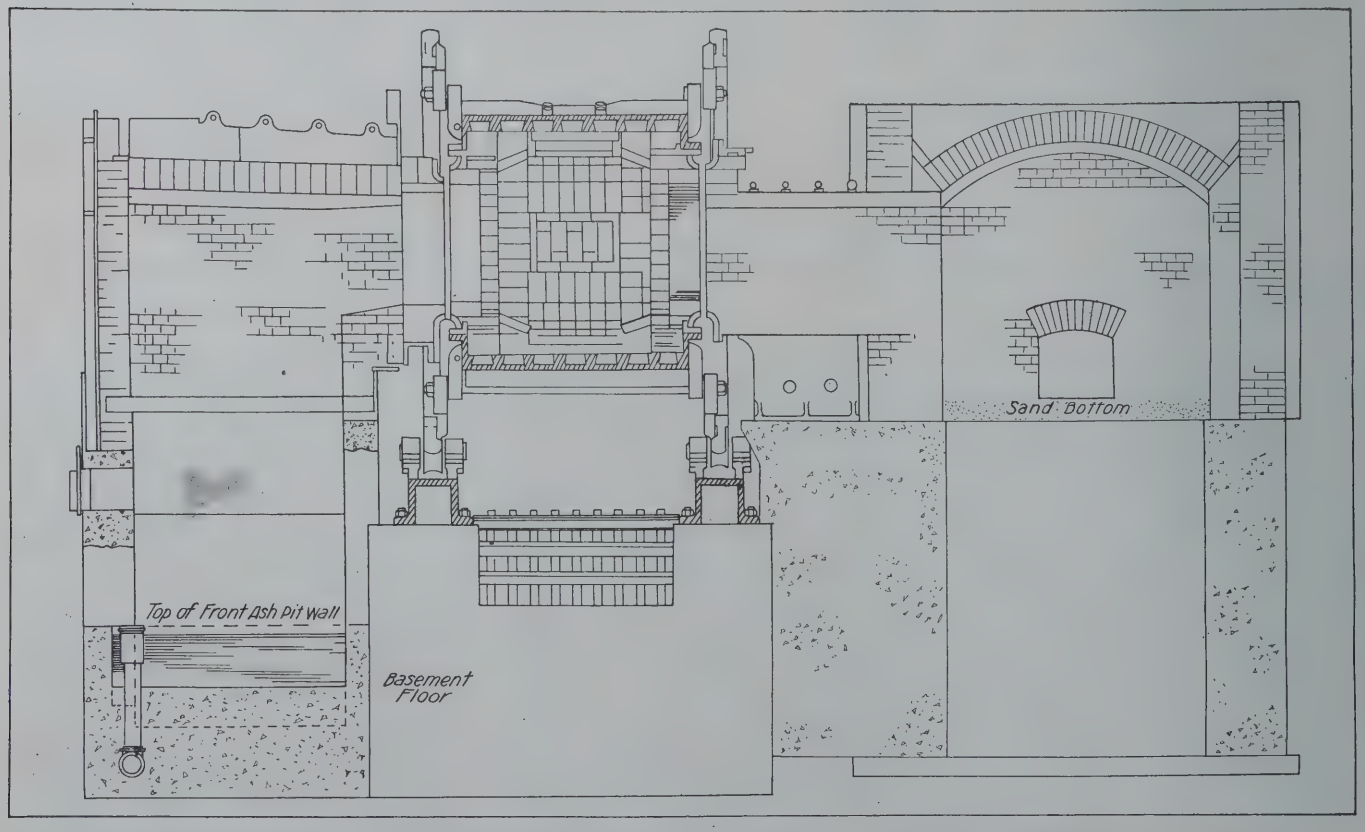


FIG. 3—ROLLING MILL SHOWING PROTECTION FOR BLOOM CONVEYOR

served on either side by a 5 x 5 billet or an 8 x 1 bar shear built by Hilles & Jones, Wilmington, Del., the material being conveyed on 12-horsepower, motor-driven, reversing rolls with push button control. Underneath the rolls is a 12-inch cast iron screw conveyor taking out the scale and built by the Lebanon company itself.

The furnaces, boilers and operating mills are all under one roof and are compactly put together, being built especially for the purpose. The main building consists of 19 bays each 20 feet long, or a total length of 380 feet. The width of this building is 147 feet 8 inches. On either side are railroad switch tracks under roof which serve the charging floors with coal and scrap. The coal is slack of usual grade. The scrap includes three grades, No. 1 wrought, turnings and light material. The scrap is lifted from the cars and deposited upon the charging floors on either side of the mill by 5-ton Electric Controller & Mfg. Co. cranes with 40-foot spans equipped with 45¼-inch magnets. The third 5-ton crane with 50-foot span serves the cooling bed. The entire center of the main mill building is served by a 20-ton electric crane with 50-foot span which is employed in changing rolls, assembling furnaces and all heavy-duty work.

The forced draft for the firing boxes

4—PLAN SHOWING FIRE BOX AT THE LEFT, ROTATING FURNACE IN THE CENTER AND WASTE HEAT CHAMBER AT THE EXTREME RIGHT

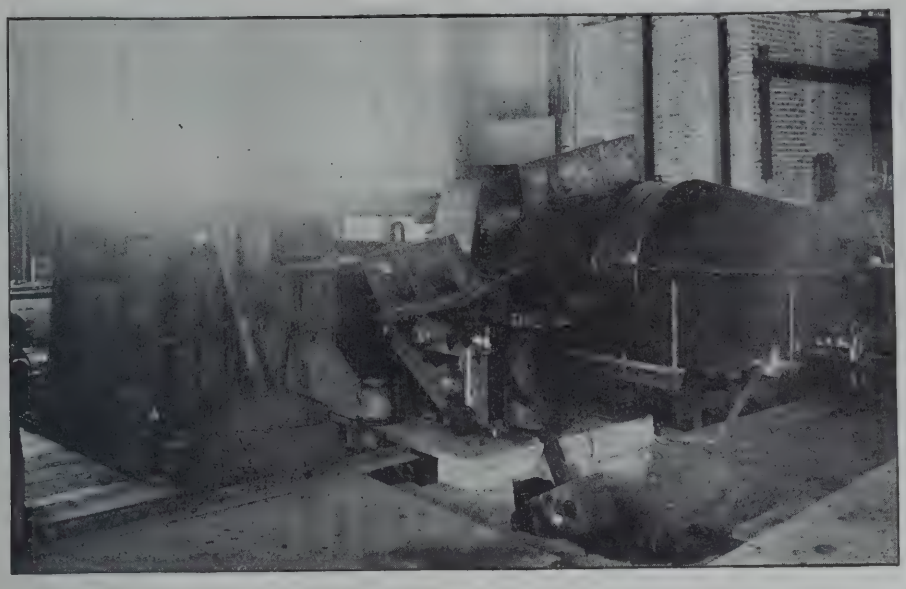

FIG. 5—THE GIGANTIC SQUEEZER AND BALL DUMPING DEVICE

is furnished by four No. 9 blowers built by the B. F. Sturtevant Co., Hyde Park, Mass., driven by 30-horsepower motors. They are mounted underneath the charging floors, which serve each side of the heating portion of the mill and are 100 feet long and 43 feet 6 inches wide.

The charging floors are so well arranged that two men serve with shovels one firing box each, operate the ingeniously constructed hand operated charging machine, etc., while the two electric controls on each of a pair of rotating heating furnaces are operated by one man, thus making each furnace served by 1½ man, a minimum of labor. Yet when the crushed coal system now being built is placed in operation at each furnace, even this minimum will be reduced probably to two men on a charging platform, one of these being a day laborer.

The main mill building is constructed upon massive concrete foundations as are also the foundations for the furnaces, roll stands and engines. The walls of the building are largely brick up to about 10 feet, and thence upward to the roof are of Fenestra steel sash and glass, thus affording splendid light in every portion of the building. The framework of the building is of structural steel, 500 tons being used by the Bethlehem Fabricators, Bethlehem, Pa., in its erection. The Belmont Iron Works put 70 tons of steel into the charging floor foundations. The building is roofed with interlocking cement tile made by the American Cement Tile Co., each tile being 52 x 26 inches and weighing 130 pounds.

The crushed coal firing device, which was invented, designed and patented by Chief Engineer Heffelfinger of the Lebanon company, consists of a hopper-feed with blower, coal crushed to 200-mesh screen being employed. The device first was tried out on the company's 10-inch reheating mill in the old plant, attaining such efficiency as to get heats ready in 15 minutes and putting the furnace in shape to charge in 40 minutes.

The Lebanon Valley Iron & Steel Co. began clearing the ground for the proposed mill on Oct. 26, 1918. The works, therefore, were less than nine months in being built and undoubtedly would have been in operation some weeks sooner except that the orders for material, equipment, etc., were placed under war conditions. When the Amalgamated Association of Iron Steel and Tin Workers went east of the Allegheny mountains something like two years ago and began to organize the puddlers, bar mill rollers, etc., in a number of plants, the Lebanon company prepared for what it believed would be an inevitable struggle to keep its mills in operation. A satisfactory site was selected just alongside the old puddle mill of the Lebanon company and active construction was begun last autumn. Therefore, when last April a strike was called in the hand mills of the company by the Amalgamated association, the company merely transferred its activities to the new mill and rushed work so that it now is virtually independent of any of its old plants and is not hampered by any union mill organization of its employes.

The president of the Lebanon Valley Iron & Steel Co. is Hon. W. C. Sproul, governor of Pennsylvania. The vice president, who has been actively identified with the new venture, is Felton Bent; while the secretary and treasurer is Howard Longstreth. The general manager, to whom is due much of the credit for conceiving and executing the splendid piece of work is Jno. C. Brown who has worked untiringly to bring the splendid success with which the project even this early has met. The chief engineer of the company, who designed much of the equipment as well as considerable of the plant layout is Charles S. Heffelfinger, who had served as crushed coal expert with the Philadelphia & Reading railroad. The master mechanic is Harry Moyer who has won well deserved encomiums for the masterly way in which the actual construction and installation were executed.

FIG. 6—AUTOMATIC CRUSHED COAL FIRING DEVICE

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

ALFRED LAMAR, assistant director of sales, has returned to Washington from Europe and resumed his duties in the office of the director of sales, war department. Mr. LaMar will have the immediate supervision of sales of surplus war materials made for export, and direct the activities of the machine tools section of the office of the director of sales. Mr. LaMar went to Europe early in April to survey European markets. He arranged the details of the visit recently made to the United States by a commission from the construction metallique which came to this country under the auspices of the Belgian government to inspect, with a view to purchasing, government-owned machine tools. Mr. LaMar organized the machine tool section of the office of the director of sales shortly after the establishment of that office by the secretary of war.

Marion F. Crawmer, former manager of the Chicago branch of the Detroit Twist Drill Co., has resigned to become associated with the Tool Salvage Co., Detroit.

Richard Goedecke, vice president of the Cleveland Duplex Machinery Co., Cleveland, has been appointed to have exclusive charge of the used machinery department of that company.

J. A. McGee of the sales department of the Graton & Knight Mfg. Co., Worcester, Mass., is on his way to Japan to investigate market conditions in that country.

E. T. Boland, for 15 years affiliated with the Kissel Motor Car Co., Hartford, Wis., has become associated with the Topp-Stewart Tractor Co., Clintonville, Wis., in the capacity of works manager.

Richard H. Long, head of the Richard H. Long Machinery Co., Framingham, Mass., has been nominated for governor of Massachusets by Democrats for the second successive year.

Gen. Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric & Mfg. Co., sailed Sept. 20 for Europe for the purpose of completing arrangements for the extension of the foreign trade. General Tripp will be in Europe for the next six weeks.

T. E. Toomey has been made manager of the Boston Pulley & Shafting Co., 197 High street, Boston. For 15 years he was sales manager for the Dodge Sales & Engineering Co., that city.

William H. Chappell, for several years connected with the Page-Storms Drop Forge Co., Chicopee, Mass., has taken the superintendency of the drop forge department of the General Railway Signal Co., Rochester, N. Y.

Malachi G. Brennan, advertising manager for the Sanford Riley Stoker Co., Ltd., Worcester, Mass., has been transferred to the sales department of the Chicago office of the company. He will be succeeded by Otis C. Sheldon.

William E. Kelly has retired from active management of the Kelly Reamer Co.'s affairs at Cleveland. He was the company's president and general manager and his duties now are discharged by J. M. Davie, formerly assistant general manager.

E. V. Wenzill has been made manager of the grinding machine division in Chicago and vicinity for the Modern Tool Co., Erie, Pa. He formerly was affiliated with the Norton Grinding Co., Worcester, Mass., but for some time has been doing grinding work in France.

Otto Koch, Sheboygan, Wis., has resigned as assistant cashier of the Security National bank to become associated with the Wald Mfg. Co., Sheboygan, automobile parts and accessories, as a stockholder and sales manger.

H. J. Porter, who has been connected with the sales department of the Timken Roller Bearing Co., Canton, O., for the past eight years, has been advanced to the position of sales manager with headquarters at the general offices of the Timken company at Canton.

C. S. Crane has resigned from government service as supervisor of production and inspection in the motors and vehicles division of the quartermaster's corps and now is affiliated with the Wilton Tool & Mfg. Co., Boston, as mechanical and sales engineer.

Harry J. Lindsley and William F. Jennings have been promoted to be vice presidents of the Bound Brook Oil-less Bearing Co., Bound Brook, N. J. Mr. Lindsley has been western sales manager for seven years and Mr. Jennings has been eastern sales manager for about five years.

Lowell Pickup, who was a sergeant in the army and served overseas, has gone to Georgia to take charge of that territory for the Stanley Works, New Britain, Conn. Gerald Coholan, until recently a lieutenant in the army, has gone to California, in the interests of this same company.

Marshall C. Edmunds has been placed in charge as district sales manager of the sales offices established recently at 208 South La Salle street, Chicago, by the Sizer Forge Co., 244 Larkin street, Buffalo. His territory will comprise Wisconsin, Minnesota, Illinois, Iowa, Missouri and upper Michigan.

Herbert Duckworth has been promoted from assistant sales manager of the Norton Co., Worcester, Mass., to be chief sales manager. Capt. Robert E. Nugent, formerly in charge of the Groton Shipyard Housing Corp., has been placed in charge of the tile department to succeed F. A. Emery, who now becomes assistant to W. L. Neilson.

Wesley M. Beatty has been appointed to succeed Craig Geddis who recently resigned from the publicity department of the Mesta Machine Co., Pittsburgh. Mr. Geddis has filled that position since he was discharged from military service and now takes up new duties in the sales department of the Reading Iron Co., Reading, Pa.

J. R. Comber, who has been with the Timken Roller Bearing Co., Canton, O., for the past seven years, has been moved from the position at the head of the sales-order division to field work in connection with the tractor and farm implement division. George C. McMullen, Pacific coast representative of the Timken company, has opened an office at 450 Monadnock building, San Francisco.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

JESSE K. BARKER has been named as district sales manager in Seattle, Wash., for the Jones & Laughlin Steel Co., Pittsburgh. He recently was tendered a farewell dinner and presented a beautiful gold watch and chain by a number of his associates at the main office of the company. Mr. Barker, who has been identified with the Jones & Laughlin company for the past 29 years, is a native of Pittsburgh and has lived there all his life. His first connection with the company was in the freight traffic bureau and during the past 12 years he has been assistant to Robert Geddes, manager of the hot-rolled department of the company. The Seattle offices of the company are located in the L. C. Smith building.

R. S. Hunter has been made manager at Chicago of the Warren Oil Co. of Pennsylvania, Warren, Pa.

I. L. Houghton, vice president and general manager of the Maumee Malleable Iron Co., Toledo, O., has resigned. No announcement is made as to his further plans.

D. R. Scholes, resigned recently as second vice president of the Illinois Malleable Iron Co., Chicago, to become affiliated with the Aeromotor Co.

L. R. Custer, who was development engineer for the Midvale Steel & Ordnance Co., has been elected vice president of the Cambria Steel Co., Johnstown, Pa.

A. R. Gilham has been appointed managing director of Canadian Vickers, Ltd., Montreal. He formerly was associated with the St. John Dry Dock & Shipbuilding Co., Ltd., with headquarters at St. John, N. B.

W. J. Haddaway has been appointed sales agent for the Pioneer Coal & Coke Co., Syndicate Trust building, St. Louis. He will have charge of the distribution of Illinois coals, both steam and domestic.

Charles Riddell, formerly manager of the Chicago office of the Baldwin Locomotive Works and the Standard Steel Works Co., has returned to his duties in Chicago after an absence of 18 months on special duty at the Philadelphia office. Arthur S. Goble, who has been in charge of the Chicago office, has been made manager of the St. Louis office. Henry Blanchard, sales representative at Chicago for the Baldwin and Standard companies, has been made manager of a branch sales office in the Merchants National Bank building, St. Paul, Minn.

Samuel Siddall has retired from active participation in the business of the Warren Iron & Steel Co., Warren, O., having resigned as vice president and treasurer, a position held by him for about seven years.

JESSE K. BARKER

Paul D. Goodman resigned his connection with the Epping-Carpenter Pump Co., Pittsburgh, and on Oct. 1. became sales manager of Chas. F. Ames & Co., Ltd., 90 West street, New York City, which conducts the sales department of the Platt Iron Works, Dayton, O.

A. Brauer, Detroit, who has been associated with the Mansfield Steel Corp. for six months as body designer, has been promoted to the position of assistant general manager, in charge of production, quantity surveys and production engineering. Mr. Brauer formerly was in the government's service.

James N. Mackin, who represented E. C. Atkins & Co., Indianapolis, and Hamilton, Ont., manufacturers of silver steel saws, in Washington, during the war, has been appointed representative of the company in Australia with headquarters at 5 Australasia Chambers, Martin Place, Sydney, N. S. W.

Melville J. Collins succeeds William Lynch who resigned recently as general superintendent of the Mahoning Valley Steel Co., Niles, O. He has been identified with the Mahoning company since its formation and formerly was in the operating department of the Empire mills of the Brier Hill Steel Co.

R. S. Richards resigned as advertising manager and purchasing agent of the Atlas Car & Mfg. Co., Cleveland, on Oct. 1, to become president and general manager of the United Roll & Foundry Co., Ravenna, O., which has just been recapitalized and reorganized to manufacture rubber machinery and to conduct a jobbing foundry. Mr. Richards was connected with the Atlas company for 16 years.

C. A. Pennock has resigned as superintendent of the sheet and tin plate plant of the Bethlehem Steel Co., at Sparrows Point, Md., having filled that position since the plant was built. On Oct. 1, he accepted a position with the Eastern Rolling Mill Co., Baltimore, as general superintendent. Prior to going to Sparrows Point, Mr. Pennock was superintendent of the Massillon Rolling Mill Co., Massillon, O.

Lieut. Col. Julian S. Hatcher, of the ordnance department of the army, Washington, has been appointed commanding officer of the United States armory, Springfield, Mass., to succeed Col. Lindley D. Hubbell, who has been commandant since July, 1918. Col. Hatcher is 31 years old and the youngest man ever in charge of the Springfield plant. He has perfected numerous inventions in ordnance of all kinds and is an authority on machine guns.

Protest Ruling

Of Freight Rates on Returned Defective Castings and Forgings

Washington, Sept. 30.—An emphatic protest has been filed by foundrymen throughout the country with the railroad administration against a recent ruling of the official classification committee which in effect increases freight rates on returned defective castings and forgings. Malleable foundrymen especially have taken the lead in this movement. The order in question makes the freight rate on rejected material the same as that on perfect castings and forgings. Heretofore this material was classed as scrap and therefore shipped under the lower scrap freight rates.

The order follows:

"This committee has just given careful consideration to the question of rating properly applicable on return defective castings or forgings. A common practice among manufacturers, which seems to be spreading, is for the manufacturer of machinery or iron or steel articles, to contract with the foundry or steel mill for supply of rough castings or rough forgings, the contract providing that the castings or forgings in which imperfections are discovered during the machining process, shall be returned to the maker, who upon examination and finding of the defects will credit the purchases with the purchase price. It is generally impracticable for the manufacturer who has discovered defects in such articles, to break them in order to reduce them to a condition in which they would unquestionably be rated as scrap iron or steel, such breaking interfering with the examination to be made by the maker on return. Such articles, however, have in fact generally a value only as scrap iron or steel and are of no use whatever except for remelting. Owing to the peculiar conditions under which they are returned, however, they retain a value as castings or forgings until the maker has verified the defects found by the purchaser.

"This condition throws upon the carriers the responsibility which they would have in transportation of the original article and we, therefore, decline to view such articles as being entitled to the scrap iron or steel rating. On the other hand any work which the purchaser may have expended upon the article is absolutely lost. Owing to the defect discovered the work has added nothing watever to the value and we feel that it has not really advanced the article beyond the casting or forging state. We have therefore, ruled that such articles handled under the circumstances described, are ratable on their return journey as castings or forgings and have advised shippers to describe them on their bills of lading as defective castings or defective forgings. This ruling has been given directly with respect to castings returned by the Ellicot Machine Corp., Baltimore, to the York Foundry & Machine Co., York, Pa.; defective castings returned to manufacturers by the Hudson Motor Car Co., Detroit, and defective forgings returned by the New Process Gear Co., Syracuse, N. Y., to the Richmond Forgings Corp., Richmond, Va.

"We have also held that articles of iron or steel which have been originally shipped as finished articles, such as piston rods, and are found to be imperfect, are upon their return journey to the manufacturers, ratable the same as the new articles in a supposedly perfect condition."

Slick-Knox Co. Plant is Getting Under Way

The Slick-Knox Co., organized by Pittsburgh and Sharon, Pa., interests a few months ago, and which took over the buildings and equipment which formerly constituted the Wheatland, Pa., plant of the Blaw-Knox Co., as well as the Hydraulic Drawn Forging Co. and the Pressed Steel Truck Co., both of Ellwood City, Pa., will begin shipments of automobile and truck frames in about a week. While frames for automobiles and trucks will be the principal product of the company, it also will produce 3 to 6-inch balls, antirail creepers, under a patent of E. E. Slick, chairman of the company, and rings for gears and ball bearings. Later, the company will start the manufacture of tuyeres and bosh plates for blast furnaces at the Wheatland plant, while at its Ellwood City plant, it will make pressed steel industrial trucks of different types and designs and at some future date will also turn out other steel specialties at this plant.

The company acquired from the Blaw-Knox Co. at Wheatland a steel building, 115 x 500 feet, with all piping, wiring and equipment, together with a hotel, located on a site of 30 acres. Since this purchase, the company has bought 63½ acres of adjoining land and has taken an option of 27 more acres, which it probably will buy. Thus the company will have altogether more than 120 acres and is providing for future plant extensions. Foundations have been laid in the factory building for the installation of new machinery, which includes four 15-ton and two wall cranes of 3 tons each, furnished by the Morgan Engineering Co., Alliance, O., one 1800-ton press, one 1000-ton press, one 500-ton press, one 125-ton press and two 80-ton presses, all steam hydraulic.

The Mesta Machine Co., Pittsburgh, is building a 4000-ton steam hydraulic press, which will be completed and installed shortly. Installations since the property was turned over to the Slick-Knox Co. early this month include a 250-ton steam press, a 300-ton power press, a 125-ton power press, and a No. 5 upsetter, beside a number of smaller hydraulic and power presses. A number of steam hammers also have been installed and the company has expended in the open market more than $500,000 for other equipment. A new machine shop, 75 x 250 feet, and a new assembly shop, 150 x 300 feet, and under construction. These buildings will be fireproof throughout, being of brick construction with window frames and sashes of steel and having composition roofing.

The daily capacity of the Wheatland plant will be 900 automobile and truck frames, 10,000 gear and ball bearing rings, from 12,000 to 15,000 antirail creepers, about 2000 forged return ells and approximately 50 tons of 3 to 6-inch balls. The company expects to turn out about 200 industrial trucks per day at its Ellwood City plant.

General offices of the company, now located in the Farmers Bank building, Pittsburgh, will be removed, Oct. 1, to the Chamber of Commerce building. Officers of the company are: Chairman, E. E. Slick; president, L. L. Knox; treasurer and assistant secretary, A. M. Moreland; secretary retary, A. M. Moreland; secretary and assistant treasurer, A. R. McGill; vice president and sales manager, William McIntyre; vice president in charge of operations, C. K. Strausbaugh; auditor, C. L. Dumbauldt; general superintendent, F. J. Curtis; chief engineer and assistant manager, W. L. Schultz. L. C. Blackwell is general superintendent of the Ellwood City plant, while E. L. Peterson is sales manager of the truck department.

Adopts Thermit Welding

Recent approval of the thermit process of welding stern frames, rudder frames and other heavy sections of ships by the American bureau of shipping is expected to introduce the thermit method more generally in the shipyards. It is said that no marine welds made by this process have ever turned out as failures. Any number of these welds have been made in the past but they have been made without the official approval of the shipping bureau. The thermit process is a patent process controlled by the Metal & Thermit Corp., New York. Approval of the method is qualified in that the bureau must be notified sufficiently in advance to have a surveyor in attendance during the welding operation who will inspect and test the weld when completed.

September's Tool Trade Buoyant

Equipment Sellers Active Despite Labor Disturbances—Manufacturers Busy and Giving Deferred Deliveries—Allied Automotive Industries Continue to Lead in Buying—Several Fair Sized Lists Still Pending—Cranes Move Freely

BUOYANCY marked the past month's activity in the sale of machine tools and equipment. This was true despite the admitted fact that labor disturbances served as an effective brake upon buying and caused numerous purchasers to withhold action on issued lists. The buying movement continued right up to and even into the period following the calling of the general iron and steel strike and many dealers remain confident that before the strike has had time seriously to affect their business, it will be past history. It is believed that if labor could be appeased an era of great industrial activity would be ushered in and it is believed that tool selling then would resemble the busiest days of the wartime period. The labor troubles which really did affect the tool industry, were the strikes among machinists in Akron and elsewhere. Similar troubles are threatening in Cincinnati, Bridgeport, Conn., and other manufacturing centers. However, consideration of the delivery dates which are deferred anywhere from 8 to 12 weeks and in some cases 16, can only bring the conclusion that the machine tool industry is in a healthy condition both from a manufacturing and a selling standpoint. Prices which have been tending upward for some time now are within 10 or 12½ per cent of the highest levels which prevailed during the war and in several instances have reached the former basis.

Automotive Industries Buy Heavy Equipment

HEAVY equipment such as boring mills, planers, etc., has occupied a prominent place in the requests for prices as well as orders from the automotive industries. Orders for miscellaneous equipment were placed by the Cadillac Motor Car Co., Detroit, and the Studebaker Corp., South Bend, Ind. The Packard Motor Car Co., and the Hudson Motor Car Co., of the former city, indicated their intention to spend $1,750,000 and $2.250,000 respectively on buildings and equipment and placed some minor orders.

Manufacturers of automobile parts were factors in the month's buying. The Columbia Axle Co., and the Parish & Bingham Co., Cleveland, manufacturers of auto frames, bought miscellaneous equipment. The Electric Auto Lite Corp., Poughkeepsie, N. Y., inquired for several small machines and bought some for its Toledo, O., plant.

Tractor manufacturers again are active. The General Motors Corp. bought about $350,000 worth of equipment for its Janesville, Wis., plant. The Holt Mfg. Co., Peoria, Ill., closed on some of its requirements. The Cleveland Tractor Co., Cleveland, bought considerable land for early expansion. The Moline Plow Co., Moline, Ill., is understood to have supplied its requirements from government-owned stocks. Engineers of the Wellman-Seaver-Morgan Co., Cleveland, are consulting with dealers' representatives regarding equipment for a tractor plant at Akron.

Exporters Activity Somewhat Curtailed

FIGURES published during the month of September, indicated that exports of machinery in July were 48.4 per cent lower than in June. While some slight improvement is expected to show up for subsequent months, continuing low exchange rates have militated against the closing of a large number of export inquiries current in the eastern and other districts. Doubtless the largest single inquiry to appear, came from a Swedish automobile firm, which requires about 400 machines. China bought 12 drills through one New York exporter and Japan, which has been a large buyer in recent months, took many metal-working tools. Several trading companies in New York bought tools for export; these include the American Trading Co., and the Hagermeyer Trading Co. France, Belgium, England, Poland, Finland are some of the other countries to send inquiries for equipment to America.

Varied Manufacturers Indicate Tool Needs

SIZABLE lists of miscellaneous equipment were few and far between in the east during the month although fairly numerous in the Middle West. Two of the largest were issued by the Baldwin Locomotive Works, Philadelphia, and the Standard Oil Co., New York. The former closed on approximately $100,000 worth of equipment and the latter bought 50 machines for shipment to Roumania. R. Hoe & Co., Poughkeepsie, N. Y., bought a fair amount of miscellaneous equipment while the Duquesne Light Co. closed on a number of tools for its new plant at Cheswick, Pa. Armstrong, Blum & Co., Chicago, manufacturers of hacksaws, circulated a fair sized list as did the Economy Baler Co., Ann Arbor, Mich., and A. Bentley & Sons, Toledo; the latter asked for 28 machines. The Canadian Fairbanks Co., Ltd., Montreal, issued a list of 15 large machines for shipment to Vancouver. The American Borvist Co., silk manufacturer, and the Electric Vacuum Cleaner Co., Inc., both of Cleveland, closed on some machines, but the biggest lists current among Cleveland dealers came from rubber companies in Akron.

Many Crane Orders Placed in September

CRANE manufacturers have had all the business they could attend to properly during September. While steel plants took the lead in buying, locomotive manufacturers as well as the Standard Oil Co., made heavy awards; the latter bought 28 jib cranes for Bayway, N. J. The Baldwin Locomotive Works, Philadelphia, and the American Locomotive Co., New York, took 16 and 15 overhead cranes respectively, while the Phelps-Dodge Corp., New York, closed on 12 of the same type. The American Metal Co., New York and the Kelly-Springfield Tire Co., each bought three cranes and the American Shell Co., Paterson, N. J., and the United States Cast Iron Pipe & Foundry Co., Pittsburgh, each took one. Steel companies who closed on anywhere from one to five cranes of different types of cranes include the Carnegie Steel Co., for its Edgar Thomson works; the Donner Steel Co., Buffalo; the Bethlehem Steel Co., for Sparrows Point, Md.; the Witherow Steel Co., Corapolis, Pa.; the Worcester Pressed Steel Co., Worcester, Mass.; the Slick-Knox Steel Co., Wheatland, Pa.; the Pittsburgh Crucible Steel Co., Pittsburgh; the Interstate Iron & Steel Co., Chicago; Weirton Steel Co., Weirton, W. Va.; and the McKinney Steel Co., Cleveland. Inquiries still pending include one from the Carnegie Steel Co., for four cranes and one from the Cambria Steel Co., Johnstown, Pa., for five. The Midvale Steel & Ordnance Co., also is in the market for cranes for its different plants as is the Bethlehem Steel Co. Single crane purchases of overhead, locomotive and other types of cranes were numerous.

Machine Tool Buying Continues

Eastern Inquiries Outnumbered by Orders—Attractive Requests For Prices Current in West—Miscellaneous Inquiries Widely Scattered—Heavy Equipment Awards Postponed in Pittsburgh—Cleveland-Osborn and Stearns Companies Buy

LABOR dissension in iron and steel has not been reflected to any great extent in the machine tool industry up to the present time. The belief is freely expressed that the struggle will not be a long-drawn-out affair and its end may come quickly. In the East, orders are more numerous than inquiries and in Cleveland and vicinity, some extremely satisfactory business is being done, individual sales running all the way from $4000 to $20,000. The inquiry rate keeps up at a splendid rate in the West and in Chicago, machinery merchants claim to be entirely unaffected by the strike. Pittsburgh, where many steel plants have been negotiating for equipment, is hardest hit and many prospective purchasers have postponed action on their requirements of cranes and other heavy equipment. It is believed, however, that were the labor question settled a huge amount of business would come out, since a vast number of projects either are at or are nearing the breaking point. What little unrest in the machinery industry that does exist at present is found among machinists in the tool manufacturing centers such as Brooklyn, N. Y., Paterson, N. J., Bridgeport, Conn., and Cincinnati, O.

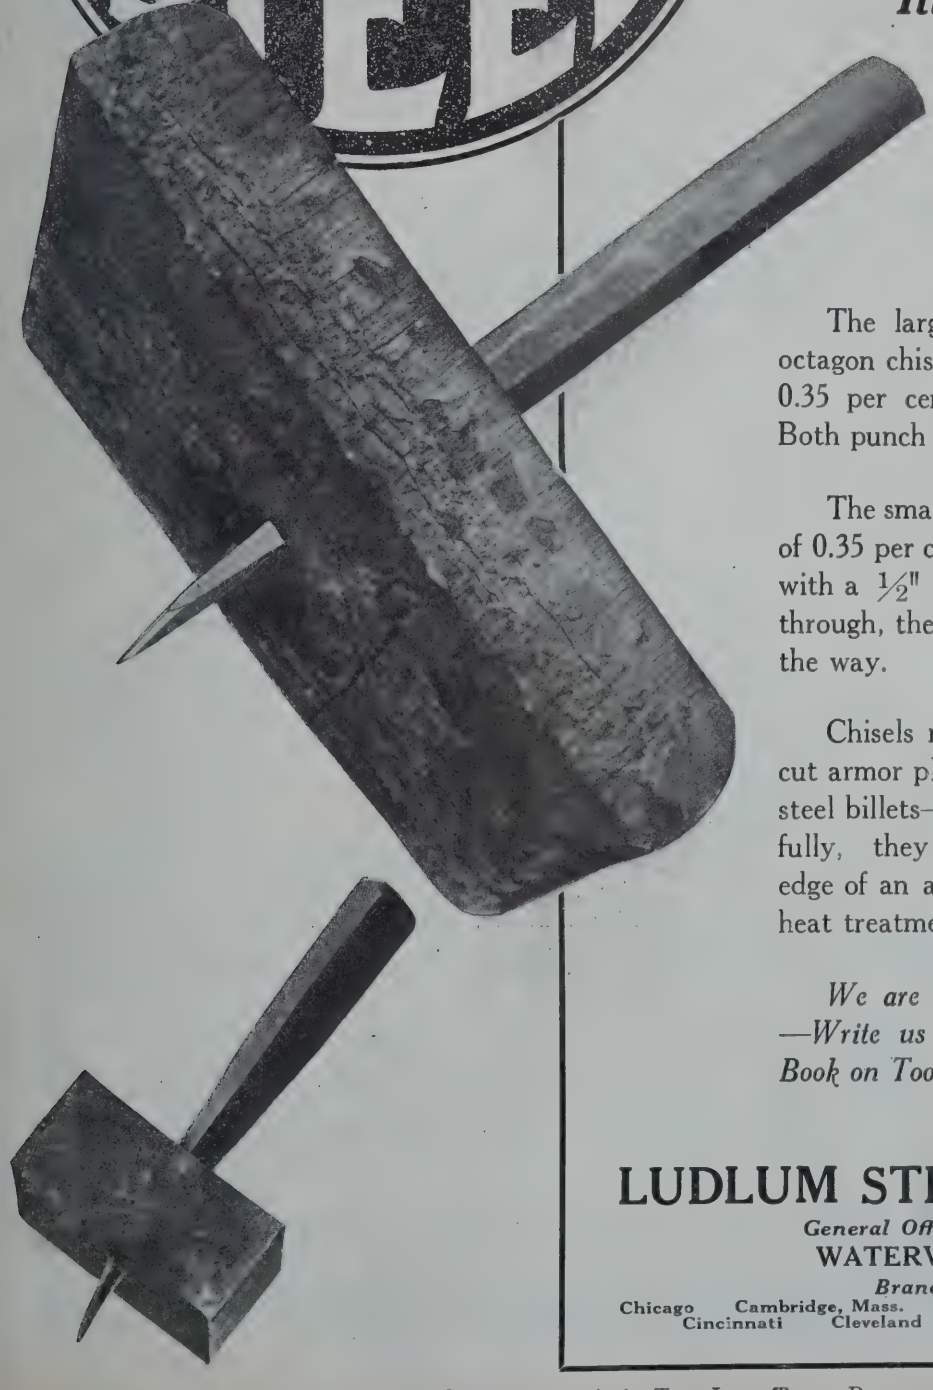
Two companies to fill their machine tool and equipment requirements from government-owned stocks recently are the Moline Plow Co., Moline, Ill., and the Remington Typewriter Co., Ilion, N. Y. The latter bought about 50 new or slightly used machines. Others have made efforts to buy but ensuing delays have discouraged them.

A strong tendency is noted in the West for companies who formerly sent machine repair work out, to establish their own machine shops and this has contributed greatly to the current demand.

The largest inquiry current in Cleveland, comes from A. Bentley & Sons, Toledo, O., and the specifications cover many tools. The F. B. Stearns Co., and the Cleveland-Osborn Mfg. Co., Inc., both of Cleveland, made sizable purchases recently. Others in the market include the Uncle Sam Tire Co., Cleveland, and the Corrugated Roofing Co., Minneapolis. The General Motors Corp., Detroit, is reported to be continuing its expansion program and recently purchased three plants in Dayton, O.; the Dayton-Wright Airplane Co., the Dayton Metal Products Co., and the Domestic Engineering Co.

Several new inquiries are out for cranes in the East including one from the American Car & Foundry Co., New York City; one from Claiborne, Johnston & Co., Baltimore, and one from the Midvale-Cambria Co., Boston. The Trans-Continental Merchants, Inc., New York City, wants 59 chain hoists from ½ to 20-ton capacity, for shipment to Japan. Single recent crane purchasers include the Framingham Foundries, Inc., Framingham, Mass.; the Gregg Co., Ltd., Hackensack, N. J.; the Nazareth Foundry & Machine Co., Nazareth, Pa.; and the Carbondale Machine Co., Carbondale, Pa. Dwight P. Robinson & Co., New York City, and J. Lipsitz, Lebanon, Pa., purchased locomotive cranes. Deliveries on this type are improving, one week to 10 days now being all the limit required.

Machine Tool Orders Exceed Inquiries in East



WHILE no large orders are being placed, the total volume of business being awarded in the eastern machine tool market is said to be fairly good. Some sellers report a rather odd situation. They state that despite the unsettlement caused by the steel strike, more orders are being received than inquiries. This development, they assert, is difficult to account for, but nevertheless, they take it as indicating considerable confidence in the trend of events.

At present, the labor situation in the machine tool industry is being little affected by the trouble in the iron and steel industry. A large strike has been threatened by machinists in Brooklyn and trouble may also develop in the Cincinnati district; however, with the improvement in the steel situation, many are hopeful that all trouble may be averted. There has been considerable unrest in Paterson, N. J., and in Bridgeport, Conn., with plants either closed down or partly so, but as a general proposition, the builders of machine tools have not been seriously affected of late by dissension in their own ranks.

The offering of new and used machines by the government and various companies formerly engaged heavily in war work, is being felt, although not to the extent that was expected earlier in the year. This is accounted for in measure by the delay that accompanies practically all transactions where government equipment is involved. However, a recent sizable order to be placed with the government in the East is that of the Remington Typewriter Co., Illion, N. Y., involving about 50 machine tools, either new or slightly used. Sellers, however, are taking an optimistic viewpoint of the situation, stating that the sooner this equipment is sold, the more healthy the market will become.

During the past few days an advance of 15 per cent has been noted in a leading line of shapers. Other

CHISEL SEMINOLE STEEL

The Chisel Steel that has awakened even the scientists!

Study These Illustrations—

The larger illustration shows a ¾" octagon chisel driven through a block of 0.35 per cent carbon steel 2½" thick. Both punch and chisel are file hard.

The smaller illustration shows a block of 0.35 per cent carbon steel 1½" square, with a ½" curved prick punch driven through, the punch remaining curved all the way.

Chisels made of Seminole Steel will cut armor plate, nickel rivets and alloy steel billets—and yet, if hammered carefully, they may be bent over the edge of an anvil. They are foolproof in heat treatment, and will not fail in use.

We are anxious to give you the proof —Write us for our Ludlum Steel Text-Book on Tool Steels.

LUDLUM STEEL COMPANY

General Offices and Works:
WATERVLIET, N. Y.

Branch Offices:
Chicago Cambridge, Mass. Detroit Buffalo New York City
Cincinnati Cleveland Philadelphia Pittsburgh

advances have been noted, but they have been confined almost entirely to special tools.

One of the largest building projects to come up in the East of late is a $1,000,000 plant addition for the International Motors Co., at Allentown, Pa. Another sizable project is a 1-story machine shop, 80 x 220 feet, for the Carbondale Machine Co., Carbondale, Pa. The company now is buying equipment, having already purchased a 5-ton gantry crane.

While there have been no large lists during the past few days, the eastern crane market continues fairly active. Several new inquiries calling for one and two cranes, are out, and orders are being placed steadily. Included in new business is a 10-ton overhead crane for the American Car & Foundry Co., 165 Broadway, New York City. Claiborne, Johnston & Co., Baltimore, are in the market for two 5-ton cranes, with 50 and 75-foot spans respectively. The Midvale-Cambria Co., Boston, is inquiring for a 10-ton crane, with a 65-foot span. The American Metal Co., New York City, has withdrawn its inquiry for one 5-ton and two 10-ton electric cranes, and now is asking for bids on a 25-ton handpower crane. This crane is for Monterey, Mexico.

A feature of the demand is an inquiry for 59 chain hoists, ranging in capacity from ½ to 20 tons. This inquiry has been issued by Trans-Continental Merchants, Inc., 80 Maiden Lane, New York City. The equipment is for Japan, and is as follows: Five ½-ton, 10 1-ton, five 1½-ton, five 2-ton, 10 3-ton, three 4-ton, 10 5-ton, two 8-ton, five 10-ton, one 20-ton and three 15-ton hoists.

Orders of the past week include a 10-ton electric, placed with the Chesapeake Iron Works by the Framingham Foundries, Inc., Framingham, Mass. The Gregg Co., Ltd., Hackensack, N. J., awarded two 7½-ton cranes with spans approximating 58 feet, to the Champion Engineering Co. The Nazareth Foundry Co. & Machine Co., Nazareth, Pa., has placed a 15-ton overhead crane with the Shaw Electric Crane Co. The 28 jib cranes for the Bayway, N. J., plant of the Standard Oil Co. of New Jersey, referred to last week as having been placed, went to the New Jersey Foundry & Machine Co. The Carbondale Machine Co., Carbondale, Pa., has placed a 5-ton gantry crane, with 76-foot span, with the Shepard Electric Crane & Hoist Co.

Deliveries on locomotive cranes are improving steadily. Whereas a few weeks ago several of the builders were booked up a month or six weeks in advance, shipments can now be made most generally within a week or 10 days. Included in awards of the past week is a 20-ton crane for Dwight P. Robinson & Co., 6 Broadway, New York. This business went to the McMyler-Interstate Co., Bedford, O. In addition to the 15-ton crane noted last week, for Chelsea, Mass., J. Lipsitz has also placed a similar sized crane with the Orton & Steinbrenner Co., for Lebanon, Pa.

Strike Brings Postponements in Pittsburgh

WITH no small proportion of the recent inquiries for cranes and other heavy equipment coming from steel manufacturers or industries in close relation with the steel business, the intervention of the strike and the consequent closing down of a number of plants, has brought an indefinite postponement of the placing of orders. Agents of manufacturers of heavy machinery generally in the Pittsburgh district report business to have been quieter in the past week than for several months. Demand for machine tools also has suffered some contraction and the tendency is to ascribe the decline to the unsettled labor situation. Few, if any, of the machinery or tool manufacturers are affected by the strike.

Much Tool Business Current in Cleveland

NOTICEABLE effects of the general iron and steel strike upon the manufacture and sale of machine tools in the Cleveland district are as yet lacking. Sellers report the receipt of numerous inquiries contributed by a widely scattered trade. Orders too are frequent, although sizable business is not being placed at present. However, several orders aggregating from $4000 to $20,000 were placed among Cleveland dealers during the past week. The trade is sanguine as to the early settlement of the difficulty but at the same time realizes that should the strike last another week, the automotive industry will be hard hit, since stocks of raw materials are not carried for long periods. If the automobile manufacturers and allied interests are obliged to shut down, then the machine tool market will experience a set back, because most of the present business is coming from those industries.

The largest inquiry current among Cleveland distributors is the one from A. Bentley & Sons, Toledo, O., mentioned last week. The value of this business is estimated to be in excess of $1,500,000; the company has issued blueprint specifications which cover all types of machine tools as well as other equipment, and so far

Plow Company Obtains Federally-Owned Tools Quickly

WASHINGTON, Sept. 29.—Approximately 80 per per cent of the machinery required by the Moline Plow Co., Moline, Ill., to re-equip its tractor plant which was damaged by fire on Aug. 26, has been purchased from the ordnance department and air service, war department, in co-operation with the machine tool section of the office of the director of sales. This equipment has since been delivered. Brief reference was made to this in recent issues of THE IRON TRADE REVIEW.

On the day of the fire, Vice President R. W. Lea, of the Moline company, under the direction of its president, George N. Peek, formerly vice chairman of the war industries board at Washington, telegraphed to the director of purchase, storage and traffic of the war department, advising him that the complete machine equipment of the company's Universal tractor plant, consisting of engine lathes, turret lathes, automatic screw machines, milling machines, gear hobbers, grinding machines, upright boring mills, single and multiple spindle drills and radials, had been burned and that the company was in the market at once for this equipment, and asking if the war department could supply it with the necessary replacement machinery from the government surplus stocks without delay.

On Aug. 27 a representative of the director of sales left Washington for Moline and on Sept. 9, the war department had sold and put in transit the milling machines, planers and grinders required from the Chicago and Cincinnati districts of the ordnance department and the Chicago district of the air service. Prices were arrived at by the price-fixing chart adopted some time ago by the war department.

≻FLINT-RIM≺ SPROCKET WHEELS FOR DURABILITY

The life of the chain is prolonged because the wheels do not rapidly wear away from the proper pitch diameter.

≻FLINT-RIM≺ wheels have by years of service under the most trying conditions, fully demonstrated that they are the best wheels ever offered for durability and satisfactory operation.

This is particularly noticeable where the material handled is of a rough abrasive nature, such as Cement Clinker, Crushed Stone, Phosphate, Ashes, etc.

The reason for this great success is that the ≻FLINT-RIM≺ wheels have smooth, hard bearing surfaces for contact with the links, and are carefully fitted for the chains, thus giving an ideal condition to start with, and maintaining it so persistently that both the wheels and chain are practically insured against undue wear.

The material increase in the efficient life of the installation, eliminates the expense of frequent renewals, and greatly reduces the ultimate cost.

Specify ≻FLINT-RIM≺ Wheels

as can be learned little or none of it has been awarded. A smaller inquiry is issued by the Uncle Sam Tire Co., 1908 Euclid avenue, Cleveland; it calls for one each 60-inch boring mill, 20-foot lathe and hack saw with 6-inch capacity. The Bonnot Co., Canton, O., wants a large boring mill and a 6-foot radial drill. The Auer Register Co., Cleveland, wants a squaring shear and the Cuyahoga Tool Co., that city, is in the market for some equipment, including milling machines. The Corrugated Culvert Co., Minneapolis, is in the market for a riveting hammer, an air compressor, a forging furnace, an automatic screw machine and a threading machine. The Kull Machine Co., 2350 East Fifty-fifth street, Cleveland, is advertising for a ⅝ or ⅜-inch Cleveland automatic model B screw machine and a punch press. The Enterprise Aluminum Co., Massillon, O., desires to obtain a 24-inch lathe while the National Safe & Lock Co., Cleveland, is in the market for a cold saw. Among the machine tools wanted by the Molle Typewriter Co., Oshkosh, Wis., is some automatic screw machines, and Frank D. Fuller, president of Fuller & Sons Mfg. Co., Kalamazoo, Mich., maker of truck transmissions, advises his company soon will be in the market for machinery for a 40,000 square foot addition to his plant.

Two of the larger purchasers in Cleveland recently are the F. B. Stearns Co. and the Cleveland Osborn Mfg. Co., Inc., both of Cleveland. The former purchased four No. 2A Warner & Swasey turret lathes, complete with bar and chucking equipment. The Cleveland-Osborn company bought three No. 35 Landis horizontal, boring, milling and drilling machines. The Lewis Steel Products Co., Toledo, O., is understood to have placed its order for 10 or 12 grinders and wants two by express. The best delivery offered by the Brown & Sharpe Mfg. Co. on the type of equipment wanted is April 25 and on some of the machines it produces, delivery cannot be made before October, 1920. Other delivery dates run into May, June, July, etc., of next year, very few of its machines being available for 1919 delivery. Work has started on its 80 x 300-foot machine shop. The Western Gears & Parts Co., Dallas, Tex., is understood to have closed upon most of its requirements.

Manufacturers who are expected to enter the market for equipment soon for additions, new buildings, etc., represent different lines of activity. The C. & G. Cooper Co., Mt. Vernon, O., maker of engines, etc., is to spend $500,000 on new buildings, including an extension to its machine shop. The Hoover-Suction Sweeper Co., North Canton, O., is to erect a 4-story addition, 80 x 170 feet. The National Spring Products Co., Gary, Ind., is reported to be ready to erect a 4-story plant, 500 x 890 feet. The Fulton Foundry & Machine Co., Cleveland, has awarded a 100 x 111-foot addition. The Thompson Grinder Co., Springfield, O., will erect a 1-story factory, 62 x 200 feet. Other companies in the automotive trades who are arranging for expansions include the Automobile Equipment Co., Blackstone building, Cleveland; the Champion Ignition Co., Flint, Mich; the Hupp Motor Car Co.; the Maxwell Motor Co., and the Page-Detroit Motor Car Co., Detroit; the Apex Motor Co., the Michigan Machine Co., and the J. W. Murray Mfg. Co., that city. Action of some sort in Cleveland is expected to be taken by the National Supply Co., Toledo, O.

Chicago Market Unaffected by Strike

BUYING of machine tool equipment in the Chicago market has not been affected by the strike in the steel industry, as far as merchants are able to determine. The large volume of inquiry and sales in single tools or small lots continue, although buying in larger lots still is absent.

One factor which brings considerable business as noted by several sellers, is the establishment of small machine shop plants to do repair work which formerly was sent out to general shops. Apparently this practice has proven unsatisfactory and many companies are preparing to do their own repair work. As an instance of the unusual sources from which this demand comes, a Chicago seller recently took an order for several light tools from a concern which operates a mill to grind cattle feed, the equipment being designed to make repairs on the mills and conveying machinery.

Strong demand for additional equipment is being received from manufacturers of road building machinery, gasoline engines, truck and automobile engines, concrete mixers and heavy duty tractors. The only recent change in prices is an advance of 10 per cent on radial drills which is general. Deliveries are becoming more advanced, and 60 to 90 days or more is now the rule.

The St. Louis Brass Mfg. Co., St. Louis, will build a 6-story factory building. The Michigan Machine Co., Detroit, will build a 3-story factory building. The Maytag Co., Newton, Iowa, is building a foundry. Ponca City, Okla., has voted $200,000 for a waterworks system and electric light plant.

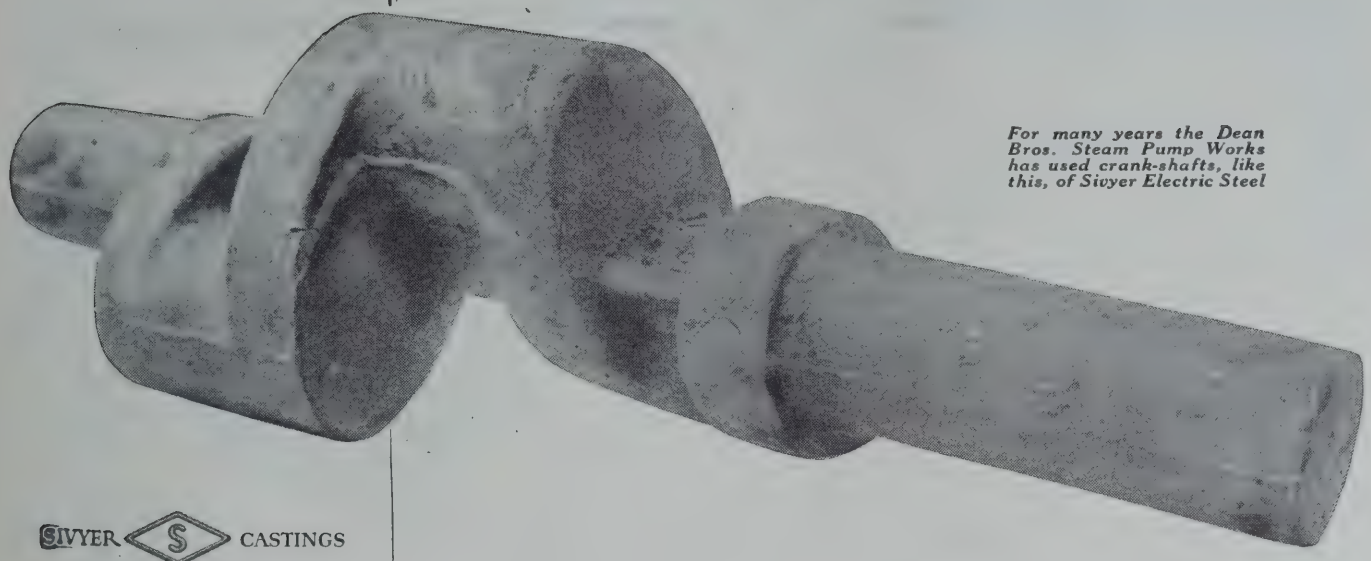
Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

PORTLAND, ME.—The American Zinc Co. of Ohio has been incorporated with $1,000,000 capital by C. A. Hight and H. P. Sweetser.

WESTMINSTER, VT.—A $200,000 shop, one story, 150 x 500 feet, will be erected by the Abenaquet Machine Works.



BEVERLY, MASS.—The United Shoe Machinery Co. has let a contract for a storage building to cost $500,000.

BOSTON.—The Landis Machine Co. is having plans drawn for a machine shop, 1-story, 20 x 120 feet, to cost $65,000.

BOSTON.—The United States Steel Toy Co. has been incorporated with $75,000 capital by K. A. Juthe, John C. Juthe, Alliston, Mass., and John R. Riggleman.

BOSTON.—The Barnstead Mfg. Co. has been incorporated to make sterilizers, stills, etc., with $40,000 capital by Hiram Barron, J. Hiram Smith and A. P. French.

BOSTON.—The Lithuanian Mechanics & Machinists

For many years the Dean Bros. Steam Pump Works has used crank-shafts, like this, of Sivyer Electric Steel

SIVYER CASTINGS

The Sivyer Service of providing Electric Steel Castings has for its objects the decrease of machining costs and the increase of wearing-quality and life. Both are attained by methods which result from long experience and begin with the design of the casting itself. When we find that a casting we are asked to furnish is of a design not consistent with good foundry practice, we study its function in the completed unit and offer the necessary suggestions to make it a really practicable casting job without affecting in any way its function and efficiency.

Secondly: Sivyer Service analyzes the functions of the casting and specifies the proper composition steel for the job; long experience with carbon and alloy steels has enabled us to reduce costs and increase quality remarkably for many different industries.

Thirdly: Sivyer Service makes a careful study of the pattern and molding problems involved, for improper gating and insufficient risers are often the greatest wasters of machining labor and metal.

Fourthly: Sivyer Service analyzes carefully the proper annealing methods to be used and controls their proper application through unfailingly efficient equipment and men. In short, the Sivyer Service supervises every step necessary to secure unusually and unfailingly good castings of electric steel. It never relies on one factor alone, relies very little even on the natural freedom of electric steel from occluded gases and on its commonly recognized merit in resisting crystallization. It also depends but little on the inherent scientific accuracy of the electric furnace process. From casting-design to sand-blasting and tumbling, the fundamental superiority of Sivyer Steel is due to its men and metal. Their value is best proved by the fact that, although the production of steel castings is generally looked upon as a local one, the Sivyer market is national.

THIS crank-shaft casting is one of many interesting illustrations of the merits of Sivyer methods and metal that have won for Sivyer Castings their national market. Crank-shaft castings must be absolutely sound, entirely free from shrink-holes and other defects. Cast crank-shafts must be made of superior steel so thoroughly annealed that they will have to the utmost that superior strength and resistance to crystallization so vitally essential to their function. For years Sivyer methods and metal have produced for Dean Bros. cast crank-shafts so free from flaws, so thoroughly proof against crystallization, that the record thus made has influenced a number of manufacturers in different sections of the country to come to Sivyer for similar castings.

SIVYER STEEL

SIVYER STEEL CASTING COMPANY, MILWAUKEE

Corp. has been incorporated to manufacture machinery, autos and accessories with $100,000 capital by Jonas L. Girdvianis, Peter Dangveckis, South Boston, Mass., and A. Valantiejus.

CAMBRIDGE, MASS.—Bids closed Sept. 27 for a 2-story, 85 x 80-foot warehouse for the Riverside Boiler Works.

CHELSEA, MASS.—The Richard T. Green Co. will take figures for a dry dock.

EASTHAMPTON, MASS.—Plans have been drawn for a 2-story addition to the plant of the West Boylston Mfg. Co., to cost $325,000.

FAIRHAVEN, MASS.—The Atlas Storage Warehouse, Inc., will build a 1-story refrigerating plant, a 3-story, 75 x 200-foot warehouse and a 1-story, 30 x 40-foot boiler house.

HOLYOKE, MASS.—The Wells Hardware Co., Inc., plans a 4-story building, to cost $50,000.

WEST SPRINGFIELD, MASS.—The Gilbert & Barker Mfg. Co. will begin work shortly on a 1-story, 30 x 140-foot building.

WHITINSVILLE, MASS.—The Whitin Machine Co. is planning the construction of 31 cottages for its employes.

WINTHROP, MASS.—The Universal Metal Products Co. has been incorporated with $25,000 capital, by Daniel B. Riley, Wilfred E. Tait and William Milnes.

WOLLASTON, MASS.—The Tubular Rivet & Stud Co. is taking bids for a building.

WORCESTER, MASS.—The Norton Co. has let the contract for a 1-story, 40 x 400-foot kiln building.

WORCESTER, MASS.—The Worcester Auto Lock Co. has geen incorporated with $20,000 capital by William C. Bemis, Patrick F. O'Hara and Isidor Freed.

WORCESTER, MASS.—The Standard Specialty Co. has been incorporated to manufacture machines and machinery with $10,000 capital by Claire W. Deardorff, Wallace A. Hutchinson and R. H. Montague, Millbury, Mass.

WORCESTER, MASS.—Contracts have been awarded by the Coppus Engineering & Equipment Co. for an $80,000 foundry.

WORCESTER, MASS.—The Worcester Brass & Electro Plating Co. has purchased the factory of Oliver M. Dean & Sons, 316 Shrewsbury street, for $27,000 and will move there.

CENTRAL FALLS, R. I.—The Rhode Island division of the National Lamp works of the General Electric Co. has let the contract for a 3-story, 50 x 96-foot warehouse to cost $50,000.

WOONSOCKET, R. I.—The Electric Maintenance & Engineering Works, 143 Railroad street, has been organized to manufacture electrical specialties, by Arthur Dauray, 186 Harrison street, and others.

WOONSOCKET, R. I.—The Rhode Island Machine & Tool Co. has been incorporated with $100,000 capital by Wilfrid Jacques, H. Eugene Getchell, Raymond P. Jacques and Arthur A. Jacques.

BRISTOL, CONN.—The Sessions Clock Co. has let the contract for a 1-story, 40 x 110-foot factory addition.

BRISTOL, CONN.—The J. H. Sessions & Son Co., hardware, has let a contract for an addition, four stories, 72 feet long.

HARTFORD, CONN.—The Electric Parts & Service Co., 1271 Main street, has been incorporated to manufacture electrical equipment, by C. H. Schrag, Ashford street, and others.

NEW HAVEN, CONN.—A $25,000 machine shop, two stories, 44 x 100 feet, will be erected by the New Haven Machine Co.

NEW HAVEN, CONN.—The Texas Oil Co., 17 Battery place, New York, will build a garage and machine shop and office building here at the cost of $35,000.

WEST HARTFORD, CONN.—The Whitlock Coil Pipe Co. is about to start work on a plant addition, 1-story, 45 x 114 feet, to ocst $15,000.

North Atlantic States

ALBANY, N. Y.—Hunt, Helm & Ferris is having plans drawn for a factory and storage building.

ALBANY, N. Y.—The Kelly-Dennin Co. has plans for a 1-story machine shop, 150 x 150 feet, to cost $50,000.

ALBANY, N. Y.—The Thatcher Foundry & Propeller Corp., has plans for a cupola house and machine shop.

ALBANY, N. Y.—S. Wander & Sons, 135 Church street, will creet a plant addition, 3-stories, 70 x 128 feet, at a cost of $50,000.

BROOKLYN, N. Y.—The Jensen Oil Engine & Machine Co. recently was incorporated with $20,000 capital, by C. P. and B. Jensen, 220 Wakeman place.

BROOKLYN, N. Y.—The A. Schader's Sons, Inc., 783 Atlantic avenue, brass and metal products, is building a plant, 90 x 196 feet, at an estimated cost of $450,000.

BUFFALO.—The Harrison Radiator Corp. has awarded a contract for a plant addition, 1-story, 160 x 289 feet.

ELMIRA, N. Y.—The Chemung Foundry & Supply Co. has been incorporated with $50,000 capital, by H. N. Rubin, J. P. and J. D. Ward.

ESOPUS, N. Y.—The Franco-Engine & Fuel Corp. recently was incorporated with $20,000 capital, by F. Bien and J. L. Frieder, 353 West 118th street.

LARCHMONT, N. Y.—The Standard Steel & Bearings, Inc., recently was incorporated with $20,000,000 capital, by Harold C. Pryer, Ralph A. Gamble, Larchmont, N. Y., and Edwin D. Robbins, New Haven, Conn.

LOCKPORT, N. Y.—The Lockport Auto Radiator Corp. has been incorporated with $30,000 capital, by J. L. Branch, C. D. Nye and F. M. Capell.

LOG ISLAND CITY, N. Y.—A $300,000 factory building will be erected by the Gehnrich Indirect Heat Oven Co., 60 Franklin avenue, Brooklyn.

LONG ISLAND CITY, N. Y.—The Nichols Copper Co. has plans for a 1-story addition, 157 x 182 feet, to cost $75,000.

NEW BALTIMORE, N. Y.—The New Baltimore Shipbuilding & Repair Co. has been incorporated with $45,000 capital, by W. J. Wade and others.

NEW YORK.—The Aluminum Co. of America, 120 Broadway, has awarded contracts for a plant addition, 3-stories, 125 x 300 feet.

NEW YORK.—Lockwood, Greene & Co., engineers, has prepared plans for a power plant extension for the C. H. Nasland & Sons Co.

NEW YORK.—The Empire Polishing, Metal Plating Co. has been incorporated with $10,000 capital, by E. C. Kelly, 55 Liberty street.

NEW YORK.—The Dry Dock Sheet Metal Works, 140 West Forty-second street, has acquired a site on which it will erect a plant.

NEW YORK.—The Donoghue Machine Co. has been chartered with $50,000 capital, by J. and J. C. Donoghue and H. Koch, 1790 Walton avenue.

NEW YORK.—The Utility Heater Co. recently was chartered with $10,000 capital, by A. A. Berman, A. Sykes and L. Siegel, 10 East Fifteenth street.

NEW YORK.—The Philip P. Smith Co., metal products, recently was incorporated with $10,000 capital, by P. G. and S. L. Simon and P. P. Smith, 11 Broadway.

NEW YORK.—The Empire Repair & Electric Welding Co. has been incorporated with $1,000,000 capital, by R. C. Thackhara, E. F. Luckenback and C. Kuhne, 41 Whitehall street.

NEW YORK.—The Ess De Ess Machine Corp. recently was incorporated with $5000 capital, by T. Smirnoff, H. Dashmna and J. Stiriss, 11 West 126th street.

NEW YORK.—The Acme Furnace Equipment Co., capitalized at $21,000, recently was incorporated by R. W. Owncs, E. W. Stuart and F. M. Clute, 100 Broadway.

NEW YORK.—The McPhilben Lighting Fixture Co. recently was incorporated with $43,000 capital, by M. Malk, H. Schneider and B. Schaefer, Queens, N. Y.

NEW YORK.—The Garment Trade Machinery & Equipment Corp. has been incorporated with $30,000 capital, by M. Schwartz, L. and M. Rosenbaum, 1084 Forest avenue.

NEW YORK.—The Midland Accessories & Supply Co. has been incorporated with $25,000 capital, by J. J. Rafferty, E. W. Fox and W. G. Gooldy, 536 West 145th street.

NEW YORK.—The Russian Electric & Engineering Corp. of America has been incorporated with $5000 active capital, by W. Paul, C. Eakin and J. J. Hayden, 258 Broadway.

NEW YORK.—The Furnace Engineering Co. recently was incorporated with $10,000 capital, by H. S. Sleicher, E. B. Priebe and W. C. Drake, Inwood, N. Y.

NEW YORK.—The Klingtite Mfg. Co., machinery and chemical apparatus, chartered with $125,000 capital, recently was incorporated by O. Turner, R. S. Allen and W. G. Conpaughton, 672 St. Nicholas avenue.

NEW YORK.—Horace G. Cooke, Inc., blowers, exhausters, pumps, etc., recently was incorporated with $100,000 capital, by B. N. Bishop, G. P. Breckenridge and H. G. Cooke, 300 West 109th street.

NEW YORK.—The Stephen Decatur Hausler Co., hardware, tools and metal specialties, has been incorporated with $20,000 capital, by J. Lebowich, I. Bernstein and S. D. Hausler, 233 West 107th street.

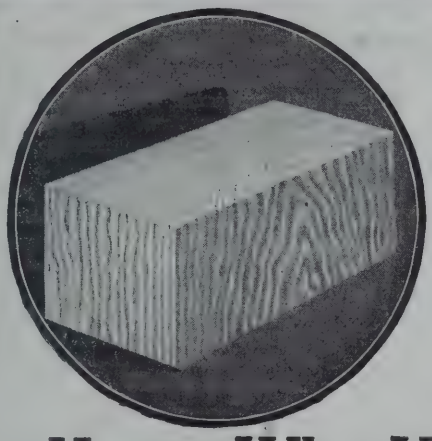
NIAGARA FALLS, N. Y.—The Niagara Machine & Tool Co. has awarded a contract for a plant addition.

NIAGARA FALLS, N. Y.—The Carborundum Co. will build an addition to its plant on Buffalo avenue to cost $92,000. George R. Rayner is general manager.

RENSELAER, N. Y.—L. J. Tibbitts, 312 Broadway, contemplates a machine shop and garage estimated to cost $30,000.

ROCHESTER, N. Y.—The Co-Operative Foundry Co. has had plans drawn for a plant addition.

ROCHESTER, N. Y.—The Northwestern Aeroplane Co. has been incorporated with $50,000 capital, by C. and W. F. Smith and F. A. B. Jonklund.



ROCHESTER, N. Y.—The Davenport Machine Tool Co. recently was incorporated with $625,000 capital, by W. S. Davenport, C. R. Burt and C. W. McKay.

SYRACUSE, N. Y.—The Spring Nut Lock Co. has been incorporated with $25,000 capital, by L. O. Keith, W. R. Hollywood and A. E. Culver.

SYRACUSE, N. Y.—The Inland Marine Corp. has been incorporated with $100,000 capital, by D. E. Alvord, B. E. Shore and M. S. Melvin to manufacture marine equipment.

ALLENTOWN, PA.—A $1,000,000 plant addition, two stories, 300 x 600 feet, will be erected by the International Motors Co.

CARBONDALE, PA.—The Carbondale Machine Shop

Kreodone
EVERLASTING
WOOD BLOCK FLOORS

Know Why You Are Buying What You Are Buying

THE engineers of the Big Four Railroad studied every available flooring material when selecting the floor to go in the Wheel Shop at Indianapolis. And they finally chose Kreodone Wood Blocks as being best suited to meet the tremendously hard service to which their floor must be subjected.

When you place *your* contract for floor blocks, be certain to specify treatment with *pure, unadulterated creosote oil—free from even a trace of tar.*

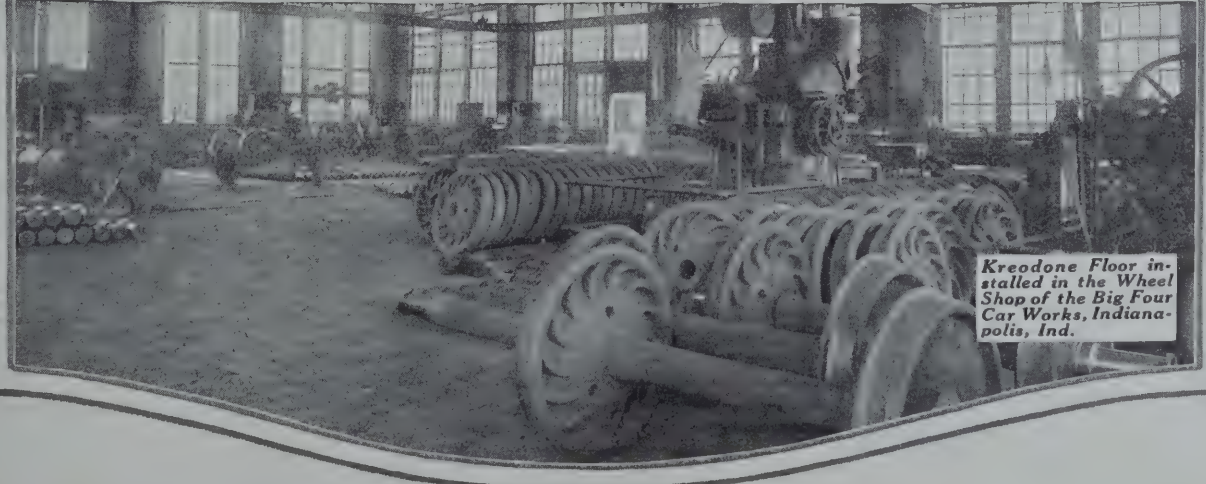
Kreodone is not only a pure unadulterated creosote oil. It is a refined, condensed, creosote oil, permanent and non-volatile.

BEAR in mind that the kind of oil used in treating the blocks is the most important factor in successful service—to insure permanency.

A KREODONE floor, laid according to our specifications, will give longer and better service than any other known type of industrial floor and never requires repair or replacement.

Time has proved the fact. Let us give you the proof—our references.

Write for our illustrated, free booklet giving our reasons WHY you should use KREODONE—*the pure creosote oil block.*



Get the *Genuine KREODONE* Blocks
Watch that Spelling—it means Service

has let a contract for a 1-story machine shop, 80 x 220 feet.

CARNEGIE, PA.—The S. Keighley Co. will remodel the plant of the Adler Stove Works for its own use.

CHESTER, PA.—The American Locomotive Co. is reporttd planning to expend $1,000,000 in doubling the capacity of its steel castings plant here.

CONNELLSVILLE, PA.—The Connellsville Foundry, Machine & Steel Castings Co. plans to increase its capital from $150,000 to $250,000, and will enlarge its plant.

CONNELLSVILLE, PA.—The Pittsburgh-Connellsville Coal & Coke Co. recently was incorporated with $10,000 capital, by R. H. Soisson, M. Burns and H. F. Bonnals Jr.

ERIE, PA.—The Erie Motor Truck Mfg. Co. will build a plant. L. H. Heiman is director.

GREENSBURG, PA.—The Penn Aluminum Co., Pittsburgh, will build a plant here.

JOHNSTOWN, PA.—The Blum Safety Razor Co. has been incorporated with $50,000 capital, by T. J. Callete, Harry Silverstone and Harry Blum.

McKEESPORT, PA.—The Amper Iron & Metal Co. has been incorporated with $5000 capital, by Robert Amper, Thomas Amper and A. M. Amper.

PHILADEDPHIA.—A $65,000 factory, two stories, 75 x 180 feet, will be erected by the Sharples Specialty Co., manufacturer of separators.

PHILADELPHIA.—Approximately $3,000,000 will be expended here by Sears Roebuck & Co., Chicago, on three warehouses.

PHILADELPHIA.—The Wicaco Screw & Machine Works, Seventh and Wood streets, has acquired a site on which it plans to erect a plant to cost $100,000.

PHILADELPHIA.—The Hale & Kilburn Corp., Eighteenth and Lehigh streets, automobile bodies, has awarded a contract for a 5-story, 196 x 260-foot plant, to cost $100,000.

PITTSBURGH.—The A. Garrison Foundry Co. has awarded contracts for a foundry, 120 x 190 feet.

PITTSBURGH.—The Union Steel Casting Co. has plans for extensions and improvements to its foundry, to cost $27,400.

PITTSBURGH.—The Allegheny Gear Works has taken an option on a plot of land, 129 x 284 feet, and has awarded a contract for a building, 80 x 135 feet.

PITTSBURGH.—The Pittsburgh Gage & Supply Co., Liberty avenue, manufacturer of mechanical specialties, etc., has plans for a 6-story plant addition, 149 x 174 feet, to cost $150,000.

PITTSBURGH.—Four storage buildings, a pattern shop and several tank cars, were damaged recently by a fire which broke out in the plant of the Pittsburgh Model Engine Co. The loss was estimated at $200,000.

STRUDSBURG, PA.—The Pocomo Metal Mfg. Co. has started work on the erection of a new plant here.

EAST ORANGE, N. J.—Bonner & Hof, Inc., has been incorporated with $100,000 capital to manufacture automobiles, by E. N. Bonner, Jamaica, N. Y., and H. J. Hof, Newark, N. J.

HILTON, N. J.—Work will start shortly on the first unit of the proposed cutlery plant of the H. Boker Co., of New York. As one of the three units of the main factory there will be a 3-story building, 135 x 155 feet. There will also be a 1-story forge and hammer shop, 57 x 137 feet and a power house, 58 x 80 feet.

NEWARK, N. J.—The Die Casting Co. has awarded a contract for a plant addition.

NEWARK, N. J.—Leonard M. Randolph will erect a 1-story machine shop, 27 x 109 feet.

NEWARK, N. J.—A machine shop will be erected here by Leonard M. Randolph.

NEWARK, N. J.—Herman Pedulaky is having plans drawn for an automobile body plant.

NEWARK, N. J.—A $66,000 factory, 4-stories, 60 x 80 feet, will be erected here by the General Electric Co.

NEWARK, N. J.—I. M. Griffiths, 41 Hamilton street, will erect a 2-story garage and machine shop, 57 x 107 feet, at an estimated cost of $20,000.

NEWARK, N. J.—The General Electric Co. will erect a 4-story plant, 60 x 80 feet at an estimated cost of $66,000.

* * *

Bethlehem Fabricators, Inc., Bethlehem, Pa., formerly the Guerber Engineering Co., has opened a New York office at room 1106 at 505 Fifth avenue.

* * *

The Carborundum Co., Niagara Falls, N. Y., has opened a new sales office and warerooms in the Burkhardt building, Second and Larned streets, Detroit, in charge of A. Dobson, formerly manager of the Montreal office of the company.

* * *

The Emerman Co. and the Erie Iron & Metal Co., dealers in iron and steel scrap, have opened joint offices in the American Trust bldg., Cleveland, in charge of Harvey Emerman, president, and Lewis B. Emerman, vice president. The main offices of these companies will continue at Erie, Pa., in charge of Leo A. Weil and Albert Emerman.

50 x 180 feet, and to install additional equipment for the manufacture of cold drawn steel.

CLEVELAND.—The Automobile Equipment Co., Blackstone building, has awarded contracts for a 2-story, 65 x 100-foot plant, estimated to cost $60,000.

CLEVELAND.—The Collinwood Foundry & Mfg. Co. has been incorporated with $150,000 capital, by D. J. Zinner, F. F. Spurney, E. M. Chaloupke and C. J. Zinner, 312 Society for Savings building.

DAYTON, O.—The Dayton Pipe Coupling Co. is erecting an addition, 1-story, 90 x 120 feet.

DAYTON, O.—The Efficiency Tool Co., capitalized at $10,000, recently was incorporated by William H. Carroll, Edward B. Glaser, Harry P. Roennecke, John B. Rettich and William H. Collins.

DAYTON, O.—Part of the plant of the Dayton Malleable Iron Works recently was damaged by fire. The loss has been estimated at $50,000.

DELPHOS, O.—Contracts have been awarded to the the H. K. Ferguson Co., Cleveland, for an addition to the plant of the American Road Machinery Co.

ELYRIA, O.—The Northington Ball Co. will take bids soon for a plant addition to cost about $70,000.

ELYRIA, O.—The American Crucible Products Co. recently was incorporated with $50,000 capital, by L. B. Fauver, B. L. Farmer, F. L. Hamel, J. W. Schmauch and H. A. Daniels.

HAMILTON, O.—The H. P. Deuscher Co. has plans for a foundry addition to include a core room, 1-story, 45 x 60 feet, to cost $30,000.

LORAIN, O.—The Steel Stamping Co. plans a plant, 1-story, 50 x 130 feet, to cost $30,000.

LORAIN, O.—The old plant formerly operated by the Brown-Cochran Co. has been sold to the Aetna Steel Casting Co., Cleveland, which plans to install two furnaces for the production of large and small castings.

MANSFIELD, O.—The Westinghouse Products Co. has awarded a contract for a plant addition, 3-stories, 100 x 150 feet, to cost $15,000.

MASSILLON, O.—Work on a plant for the Beans Spring & Mfg. Co., which was recently organized, has been started. The plant will consist of two buildings, 80 x 360 feet and 80 x 250 feet. Automobile springs will be manufactured. J. F. Beans is president.

MINERAL RIDGE, O.—The Ohio Steel Products Co. has started work on a plant, to cost $65,000.

NORTH CANTON, O.—The Hoover Suction Sweeper Co. is having plans drawn for a plant addition, 4-stories, 80 x 170 feet, to cost $125,000.

SANDUSKY, O.—The Ohio State Rubber Tire Co. is taking bids for a power plant and machine shop.

SPRINGFIELD, O.—The Thompson Grinder Co. has plans for a factory and office building, 1-story, 62 x 200 feet, to cost $60,000.

TOLEDO, O.—The Automobile Cylinder Regrinding Co. recently was incorporated with $5000 capital, by L. A. Foley, M. A. Foley and others.

TOLEDO, O.—Work has started on a $100,000 plant for the Lewis Steel Products Co., valve manufacturer. The main buildings will consist of a foundry, 80 x 300 feet, a machine shop of the same dimensions and a 2-story office building. A. R. Clas is president.

COVINGTON, KY.—This city proposes to put in a new pump at the Fort Thomas waterworks plant.

HARRODSBURG, KY.—The Bohon Buggy Co. proposes to build an addition to cost $65,000.

MOUNDSVILLE, W. VA.—Work is progressing on a plant for the Cameron Tool Co.

WHEELING, W. VA.—The J. E. Moss Iron Works is reported planning a plant addition, 120 x 240 feet, and an office building addition, three stories, 25 x 100 feet.

ANDERSON, IND.—The Anderson Foundry & Machine Works contemplates a plant addition, 2-stories, 80 x 200 feet, to cost $75,000.

ANDERSON, IND.—The plant of the Spring-Steel Fence & Wire Co. will be moved to Mason City, Iowa, according to a current report.

BRAZIL, IND.—J. M. Cutshall & Sons have the contract to erect a heating plant for the city.

Business in Canada

WINNIPEG, MAN.—The Tavani Electric Steel Co., Ltd., Belleville, Ont., contemplates a steel foundry here at an estimated cost of $5,000,000.

SYDNEY, N. S.—The Dominion Iron & Steel Corp. contemplates enlarging the capacity of its open hearth plant.

TRURO, N. S.—The city will build an addition to its electric lighting plant.

MONTREAL, QUE.—The Anglo Canadian Wire Works, Ltd., has awarded contracts for a plant here. Hutchison & Wood, 2 Place D'Armes, are architects.

MONTREAL, QUE.—The Dominion Appliances, Ltd., have been incorporated with $10,000 capital, to manufacture gears, equipment for railway cars, locomotives, etc.

MONTREAL, QUE.—Leger, Lavoie, Ltd., have been incorporated to manufacture automobiles, motor vehicles, engines, etc., with $100,000 capital, by Edouard E. Leger, Louis Dupuis, Napoleon F. Lavoie and others.

QUEBEC, QUE.—The International Paper Co., Ltd., Three Rivers, Que., is erecting a manufacturing plant here. The power plant will cost $15,000.

BELLEVILLE, ONT.—The Tivani Steel Co. plans a steel plant here. A. P. Gillies, room 1950, 50 Church street, New York, is interested.

BRANTFORD, ONT.—John Bishop & Son, Ltd., have been incorporated to manufacture hardware, tools, iron, steel and metal products, with $100,000 capital, by Francis J. Bishop, George D. Heyd and others.

CHATHAM, ONT.—Plans are being prepared for the construction of a filtration plant here to cost $200,000.

CHATHAM, ONT.—The Dowsley Spring & Axle Works has awarded a contract for a plant, to cost $80,000.

FT. FRANCES, ONT.—The International Insulating Co. plans a plant.

GUELPH, ONT.—The International Malleable Iron Co., Beverley street, has awarded a contract for an addition.

LONDON, ONT.—The London Concrete Machinery Co., is building an addition.

LONDON, ONT.—The utilities commission is having plans prepared for a hydro substation to cost $14,000.

OSHAWA, ONT.—Plans and specifications are with B. H. Prack, Lumsden building, Toronto, Ont., who is receiving tenders for five buildings to be erected here for the Pedlar People, Ltd., manufacturers of sheet metal products, etc. The building will be two stories, 80 x 360 feet, two stories, 80 x 365 feet, two stories, 70 x 285 feet, one story, 60 x 285 feet, and one story, 70 x 250 feet.

SARNIA, ONT.—The International Bushings, Ltd., which was recently incorporated, contemplates a manufacturing plant. C. E. Calvert is president.

New Trade Publications

FIRE DOORS.—The Merchant & Evans Co., Philadelphia, is circulating a catalog in which fire doors, shutters and ventilators are described and illustrated. Specifications are given as well as a list of users of the company's various products.

METALS.—Descriptions and analyses of the various grades of slab zinc are given in a 12-page booklet recently published by the New Jersey Zinc Co., New York. Mention is also made in the booklet of spiegeleisen and bullion.

BUILDING CONSTRUCTION.—A 40-page booklet designed to illustrate and explain the equipment used and the methods employed in the construction of modern buildings under a system developed by the Blaw-Knox Co., Pittsburgh, is being circulated by that company. The booklet is profusely illustrated.

PIGMENTS.—A 12-page booklet devoted to a description of the various pigments manufactured by the New Jersey Zinc Co., New York, has been issued to the trade. The different brands are described in detail and the different uses to which they are put are given.

FURNACE INSULATION.—The Celite Products Co., New York, recently issued an interesting bulletin describing in detail, standard engineering practices in insulating, annealing, heating, forging, malleable, gun, glass, and other type of furnaces. Several illustrations are presented.

CHEMICALS.—Under this title the New Jersey Zinc Co., New York, has published a booklet describing the various grades of sulphuric acid produced by the company, as well as muriatic acid, zinc chloride, salt cake, etc. The booklet contains an illustration of the company's general offices.

ROLLED ZINC.—The uses and characteristics of rolled zinc are featured in an 8-page booklet being circulated by the New Jersey Zinc Co., New York. The uses to which this material is put are given and include its use for boiler plates, building hardware, screens, shingle nails, machine plates, etc. Several illustrations are given.

ZINC DUST.—This material is described in an 8-page booklet recently published by the New Jersey Zinc Co., New York. Two grades are described in detail, one being said to contain 95 per cent metallic zinc, while the metallic zinc content of the other averages between 92 and 94 per cent. The uses to which this material can be put are given.

POWDERED COAL.—The Combustion Economy Corp., Chicago, is circulating a bulletin in which the history and the possibilities of using powdered coal as a fuel are described. Types of furnaces, draft, preparation of powdered coal for burning, storage, separation of scrap iron from coal, crushing, drying, distributing to furnaces, air supply, control, carburization and adaption to furnaces, are some of the points in the use of this fuel, which are enumerated. A line drawing of a powdered coal burning system is also given.

LOCOMOTIVE CRANES.—The Edward F. Terry Mfg. Co., New York, recently issued a catalog describing its locomotive crane for contractor's use. The catalog is illustrated and the crane is fully described. It is pointed out that the crane is built to withstand the severe duty imposed on a locomotive crane by contractors and material handlers. The frame and platform are built of heavy section steel and all working parts are proportioned to withstand hard usage. The catalog gives information on the mounting of cranes and several of the illustrations show the cranes in actual use.

TOOL GRINDER.—In a 4-page leaflet circulated by Alfred Herbert, Ltd., Coventry, England, and New York, an oscillating tool grinder is described and illustrated. In this grinder the grinding wheel oscillates rapidly past the tool, which is always in full view. Grinding may be performed with or without water. A fan connected to a streamline duct in the base of the toolholder, draws all dust and chips away. The wheel spindle, self-contained countershaft, loose pulley and all shafts in the gear box with the exception of the eccentric shaft, run on ball bearings. The eccentric shaft runs in plain bearings. Other parts of the tool are described.

SUBSTATIONS.—Railway converter substations are extensively treated in an attractive 36-page illustrated booklet recently published by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. The booklet contains a compilation of ideas for operating engineers' experience in substation work. The illustrations which accompany the various descriptions are clear and the descriptions are concise and comprehensively written. Many of the illustrations are of actual installations. The booklet is especially intended for electric railway engineers, but should be of interest to others interested in electrical equipment, etc.

ROCK CRUSHER.—Bulletin 1456, recently published by the Allis-Chalmers Mfg. Co. of Milwaukee, contains descriptions and illustrations of a rock crusher which the company manufactures. According to the booklet, the crusher contains a fixed and moving crushing element. The stationary element consists of a curved anvil, the crushing surface of which is lined with chilled iron wearing plates. The anvil is held in postion in relation to the frame by steel tie-rods co-acting against springs, which take up or equalize excessive shocks and pressure. Acting against this anvil is a roll with removable teeth, which is mounted on a heavy shaft running in massive journals. This roll is so located with relation to the anvil that preliminary fracturing of pieces of rock is effected by the sledging action of the teeth of the rotating roll on the pieces as they rest by gravity upon the roll. The descriptions of the various types are thorough and the illustrations give the reader a comprehensive idea of the equipment.

STANDARDIZED BUILDINGS.—The Milliken Bros. Mfg. Co., New York, has published a descriptive catalog in which structures designed by the company under the standardized truss unit system are described and illustrated. These building are all-steel and are furnished complete with doors, skylights, etc. They are suitable for all classes of industrial and manufacturing structures. The booklet contains illustrations of buildings of this type erected for the United States government and large manufacturers. One section is devoted to transmission towers, radio towers and special poles, which the company also builds. A companion booklet also has been issued by the company. This booklet forms a guide to the construction of buildings from foundation to roof.

DRUM CONTROLLERS.—A 4-page two-color folder has been prepared by the Cutler-Hammer Mfg. Co., Milwaukee, in which the outstanding features of drum controllers manufactured by the company are described and illustrated. The accessibility, interchangeability of parts and interchangeability of methods of manipulation are among the features given prominence. Other points described include how the contact fingers and the cylinders may be removed, metal construction and the straight nonstubbing fingers with which the controller is equipped. Dimensions, ratings and other data are given. The bulletin was prepared especially for the St. Louis convention of the Association of Iron and Steel Electrical Engineers, but is also being circulated to those interested in this line of electrical equipment.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

Breaking Point of Strike Nears

Resumption of Plants and Increase of Production Continue—Chicago Situation Improved by Military Control—New Buying Goes Ahead Briskly—Pig Iron Statistics Show Many Furnaces Banked But Small Loss of Output

INCREASED outbursts of violence by the steel strikers as their cause more plainly has become hopeless, have brought the usual exercise of more rigorous civil and military measures and this fact promises to speed up the disintegration of the movement against the mills. The strike apparently fast is reaching its final and decisive stage. Adequate protection of the steadily growing number of workmen who are returning or are desirous of returning to their jobs has become a determining factor as to the duration of the strike and the restoration of normal production. The developments of the past few days in the Chicago district are regarded as marking the definite breaking point of the struggle in that territory. The agitators have fared badly in the east where production now is almost normal. At Buffalo the leading producer again is getting under way. Conditions in the Pittsburgh district, apart from Johnstown, have improved steadily during the week. Operations have been restored at Monessen, Donora, New Kensington, West Leechburg, and other mill points. Failure of the authorities at Youngstown and Cleveland to guarantee proper protection is holding back any efforts to reopen the plants in that district, but the indications are some steps in this direction are about to be taken.

New Buying is Active

A liberal amount of new buying is going along and this is being accepted by the mills without definite delivery promises. Eastern plate and shape mills have had the biggest week since the armistice, this being due in part to the crippled condition of plants in other districts. Structural steel awards and inquiries are surprisingly well maintained. Work bid upon by independent shops in the first week of the strike totaled 38,000 tons which was exceeded by only two weeks since the armistice. Awards reported the past week aggregated over 22,000 tons. The Pennsylvania railroad has purchased 25,000 tons of material for car repairs. The navy is taking bids on 28,800 tons of plates and shapes for various yards and 15,000 tons of battleship steel.

Evidence of any extensive derangement of industrial operations as the result of the reduction of steel supplies is yet to be seen although in various products the mills have been falling back on their delivery schedules. Buyers continue to pursue a policy of co-operation and patience and are exerting as little pressure as possible upon producers.

Many Stacks Banked

The extent of the curtailment of blast furnace operations due to the strike is shown by the statistics for September just compiled. The number of furnaces blowing at the end of the month was 101 less than on the corresponding period in August. These with but few exceptions were banked awaiting a favorable opportunity to resume. Some of them since have gone into action. Of the interrupted stacks 42 were in Ohio, 18 in Pennsylvania, 15 in Illinois, 12 in Indiana and 10 in New York. Since the banking of these furnaces occurred late in the month, the loss of production was comparatively small. The September total was 2,488,583 tons compared with 2,742,081 tons in August and 2,424,212 tons in July. Because of the concentrated drive against steel works furnaces, the loss wholly was with plants of this character. In fact merchant output was increased by 25,143 tons.

Further purchases of steelmaking iron in the open market have been made in the Pittsburgh district by Steel corporation subsidiaries which closed for 15,000 to 20,000 tons of basic and bessemer. Buying of prompt foundry and malleable iron by foundries which are not getting deliveries under their regular contracts, continues and in various instances at virtual premiums of $2 to $3 per ton.

Export Sales Are Heavy

Export sales continue heavy and October starts off with great promise despite the uncertainty of deliveries by the mills. Japan has been figuring actively in the pig iron market, seeking 15,000 tons of basic and a considerable amount of foundry iron. One purchase of 5000 tons is reported.

Clamp the Law on Radicalism

HONORABLE dealing, born of a spirit of conciliation and kindliness toward his fellow man, and directed by a mind of keenly judicial and statesmanlike qualities has marked the outstanding events of the life of Judge Gary. When he testified last week before the senate committee on education and labor he carried with him an atmosphere of sincerity which gave dignity and authority to what he said. His words must have gone far toward convincing the members of the committee of the fact, which already they had suspected, that the steel strike is not a typical case of dispute between employers and wage earners, but is an assault upon the free institutions of the nation. The senators, cognizant of recent developments, and recollecting the circumstances under which congress passed the Adamson law at the dictation of the railroad brotherhoods, apparently have been made to see clearly that the steel strike is but one phase of a clearly defined movement on the part of radical leaders to overthrow constitutional government and substitute therefor a hateful, autocratic and malevolent rule of class—their class.

Judge Gary's testimony was couched in language which was exceedingly mild, and he left unsaid a good many things which properly are factors for consideration in an investigation of the present strike. He hesitated to deny that he would have talked with the union leaders had they come to him with the statement that they represented only a small part, rather than the majority, of the steel employes of the country. Had he seen them in any status whatever, the visit could have resulted only in harm to the cause of the open shop. From the performances of labor leaders in the past it is certain they would have capitalized the visit by recruiting new members of their unions with the claim that the spokesman of the Steel corporation had recognized them.

It is to be hoped that Judge Gary's testimony, especially in the light of that of Messrs. Foster and Fitzpatrick before the committee, will help to remove any disposition to seek the easiest way to bridge the gap between radical labor and the employers of the country. Any resorting to temporary expedients to compose labor conditions of this kind would result only in deferring action as ultimately must be taken.

To prevent the realization of the aims which actuate radical labor leaders, it is necessary primarily, to enforce the law. Property must be protected, law and order must be enforced, and the right of the worker to go to and from his task without the molestation of himself or his family must be upheld. Such action will eliminate the danger which now menaces industrial America, for the overwhelming majority of the citizens of the country in all walks of life, are opposed to the views of the radicals. To completely remove the menace, however, it undoubtedly will be found essential at some no very distant time to pass a law which for all time will make it impossible for radical leaders to enforce demands, such as the passage of Adamson law, under threats to tie up national transportation, England now is reaping the fruit of a misguided policy with respect to her labor radicals and it is very easy, in view of that country's present experiences, to visualize the growth of a similar tyranny here which would make life burdensome and rob the nation of that spirit of individual enterprise and freedom which has made it great. A law which would not interfere with the rights of the laboring class, but would curb any tendency to bring about such a tyranny, is a defensive measure imperatively needed by the country to protect its liberties against the outbursts of the radical element.

Public Sentiment Finding Itself

FAILURE of the strike of the steel plant laborers, which now is an apparent if not an actual fact, has served to clearly demonstrate that the people of the country are not yet ready to accept, much less espouse, the doctrines of the radical labor agitators. Proof of this is to be found in the utter lack of public sympathy with the strike of the steel plant work-

men, without which success was unattainable. Nothing has been presented other than the hearsay evidence of the overpaid organizers that the men were working for pauper wages and that their families were living under intolerable conditions.

The public, as personified by the salaried man, no longer is mislead by the biased and highly colored views of the agitator, for it does not forget that wage increases have been pretty frequent in the steel industry; that working hours and conditions of labor have been constantly growing better; that not a few workmen holding what formerly were regarded as humble positions are going to and from their work in their own automobiles and that the foreigners who have left the country have generally carried away with them a tidy sum in savings. The parallel of these conditions with the claims of the labor leaders is deadly to the assertions of the latter.

Another reason why this and other labor disturbances have found little favor with the great bulk of the people of the country, those who are neither wage earners nor capitalists, is to be found in the growing consciousness of the effect which labor agitation and strikes have upon the cost of living. Increases to labor in a plant too infrequently have been accompanied by increases to the salaried employes, but the effect upon living costs resulting from the wage increase has to be borne by the latter.

Radical labor leaders accompany their demands for higher wages with demands for shorter working hours. This means decreased production and soaring prices and that great class which is caught between these divergent forces, at last is beginning to discriminate between the wheat and the chaff; between the justified and unjustified strike of labor and to govern its sympathy accordingly. It is to be hoped that the time is not distant when those who work with their hands will be less susceptible to the seductive arguments of the parasitical disturbers, masquerading as friends of the working man.

Labor Shortage Helps Cranes

THE more optimistic predictions in the crane market of a year ago now appear in a fair way to be fulfilled. The apprehension felt in some quarters relative to the industry's increased capacity in peace times is rapidly being dispelled. For the past three months reports from virtually every industrial center in the country reflect a large volume of crane buying. This activity, contrary to expectations in some sources, has not resulted from pressure of an extraordinary foreign demand, but rather from a combination of circumstances arising from within. One large contributing factor is thought to be scarcity and increasing costs of common labor. Holders of this contention point to the fact that the present demand for cranes did not set in until it became pretty definitely assured that the cost of labor would not decline to any material degree and that a shortage, with all men returned from the other side, would continue a reality.

There may be some quesion as to the extent of the business now being placed. The buying has not been of the volume that prevailed during the war. That was hardly to be expected. At the same time, competition continues strong. The low prices in some instances, resulting, might be interpreted as indicating a none too active market. However, when the dull months of the first half of this year and the heavy cancellations following the end of the war are considered, the extent of the present demand is in accordance with full expectations.

Cutting England Out of Tin

ALWAYS highly speculative and sensitive, the tin market is in an unusually peculiar position at present. The interference with various tin plate mills by the steel strike has led many consumers to defer tin purchases temporarily. About 40 per cent of the tin consumed in the United States is in the manufacture of tin plate, while about 35 per cent is used in the making of white metals, also closely allied with steel. The bulk of the pig tin imported comes from the Federated Malay States and from England. Consequently the American tin trade always watches closely the London and Singapore tin markets.

Lately, however, the movement of sterling exchange has been watched with just as close interest, for the variation of one point in sterling exchange is equivalent to a corresponding change of about ⅛ cent a pound in the cost of importing tin. On several days recently daily fluctuations have covered more than four points. A change of £5 in the London market is equal to about 1 cent a pound in our currency. Complicating this involved situation came the great railroad strike in Great Britain. On Sept. 29, the first business day after the railroad strike was declared, the London tin market dropped over £5, while exchange also broke sharply. The London market undoubtedly was discounting the decreased consumption of the metal in England, as well as the interference with exports to this country. On the other hand, the Singapore market advanced Sept. 29 by £3, probably discounting the improvement in steel strike conditions here, also the stimulus to Americans to do business direct with Singapore rather than to buy Straits tin for reshipment from England.

Americans have found shipments of tin from England unsatisfactory in recent months, as a result of labor difficulties on the other side and prospects are that a greater proportion of our Straits tin will be imported directly in the future.

Corporation Buys More Pig Iron

Leading Interest Closes for 15,000 to 20,000 Tons Additional of Steelmaking Iron at Pittsburgh—Prompt Foundry in Demand and Brings Premiums—Southern Ohio Raised to $29.75—1920 Alabama Sales at $29

Pittsburgh, Oct. 7.—Some sizable purchases of yard stocks of the steelmaking grades of pig iron by the steel companies whose iron production at present is somewhat curtailed by the strike of common labor, has been a feature of the past week in this market. The bulk of these tonnages which aggregate about 15,000 tons of basic and a smaller quantity of bessemer have gone to subsidiary companies of the United States Steel Corp. Such sales of bessemer as have been made have been at the regular market base of $27.95 furnace and on most of the basic the full market quotation has been obtained. It is understood, however, that concessions of as much as 25 cents per ton were made on some of the sales of basic and it is stated that other tonnages are available at a price of $25.50 furnace. On the other hand there are reports that premiums above $25.75 have been paid. A sale of 2000 tons of forge iron is noted for delivery over the remainder of the year to a Pittsburgh district consumer at $26.25 furnace while 1000 tons of malleable for October and November shipment has been placed with a valley interest by a western consumer at $27.25 furnace. The demand for foundry iron still is brisk and one interest recently marked up its quotation on No. 2 grades, now quoting $29 to $31 for early delivery. Some of the foundries situated near steel plants that have been affected by the strike have lost men and are asking that shipments against contracts be deferred or restricted for a time. On the other hand foundries unaffected by the labor disturbance, constituting the majority, are pressing for deliveries against their purchases. The Standard Sanitary Mfg. Co. has not yet closed upon 1000 tons of No. 2 and No. 2X southern foundry for its Louisville, Ky., plant for which it put out its inquiry about two weeks. An active demand still is noted for silveries with the Bessie furnace at New Straitsville, O., now pretty well booked over the remainder of the year. This company has a basis of $40.25, furnace, for 8 per cent and is holding at that quotation. The Carnegie Steel Co. has made some gain in the number of active stacks while the Shenango valley merchant furnaces which blew in after a temporary suspension, still are blowing.

New England Sales Continue

Boston, Mass., Oct. 6.—With the closing down of several of the Buffalo district foundry iron furnaces a scramble to buy iron in other districts was looked for. The market here however has continued on an even course and no feature at present can be sighted as due to the steel strike situation. Iron for 1920 delivery is being offered from eastern Pennsylvania furnaces with out reservation. One order for 400 tons for first quarter was placed at $32 furnace for No. 2X (2.25 to 2.75 silicon) and many other small sales from this district have been made at the same price. Textile machinery manufacturers have been completing their last quarter requirements and two sales of over 1000 tons each have been reported for this year. The spread on prompt shipment has widened and small tonnage sales have been reported at prices ranging from $31.90 to $33.90 eastern furnace for No. 2X (2.25 to 2.75 silicon). Southern iron has continued to reach New England consumers though the prices remain firm and its use largely is for mixture purposes. The inquiry for 1920 iron is becoming more active. A Rhode Island consumer is asking for 1500 tons, western Connecticut manufacturers want several sizable lots and the foundries at Worcester, Mass., are nearly all contemplating first quarter purchases. Many of the larger furnaces however still have their books closed for next year. September proved to be a good month for nearly all New England dealers and the total sales of approximately 50,000 tons are larger than for any other month this year except June. The estimated sales through Boston dealers for the past week total 7000 tons of which 3000 was for 1920 delivery.

Heavy Japanese Inquiry Appears

New York, Oct. 6.—Japanese shipyards and other Japanese interests are inquiring actively for pig iron for early shipment. Included are about 15,000 tons of basic and a considerable tonnage of foundry iron. One Japanese interest which took bids on 5000 tons reports it has bought but gives no details. Another Japanese interest has closed for 1000 tons of foundry at $28, Birmingham, for 1.75 to 2.25 silicon. Alabama furnaces in all cases are well sold ahead and one maker gave notice in effect that he did not want to sell by quoting $32.50, Birmingham, on a round tonnage of 1.75 to 2.25 silicon for export.

While the domestic demand in this district is moderate, a fair amount of prompt tonnage is being closed. Prices are showing an upward tendency. Additional eastern Pennsylvania foundry has been sold at $32, furnace, for 2.25 to 2.75 silicon, and some Buffalo iron has been sold at $32, Buffalo, for the same grade.

While these figures are exceptional, the eastern market generally is stronger. Although $29, furnace, is minimum on Buffalo 2.25 to 2.75 silicon, and at least one round tonnage was accepted at this level during the week, one active furnace reports its regular price now is $29.50, Buffalo, for this grade for this year, with $1 lower for 1.75 to 2.25 silicon. On eastern Pennsylvania iron the minimum is $30.25, furnace, for 2.25 to 2.75 silicon, but in most cases the asking price is $30.50 or higher. One Lehigh valley interest which recently has been selling small tonnages at $31, furnace, for 2.25 to 2.75 silicon, for this year, now is sold up and has withdrawn. It continues to quote $32, furnace, on 2.25 to 2.75 silicon, for first quarter. On foundry iron for first quarter and first half, as high as $33, eastern Pennsylvania furnace, is being asked. However, furnaces willing to sell for next year are the exception. Blast furnace operators are worried as to whether or not there will be a strike of coal miners on Nov. 1. New inquiries from consumers in the metropolitan district involve only a few thousand tons. One of the Warwick furnaces of the Eastern Steel Co. is being put in blast. Witherbee, Sherman & Co.'s furnace at Port Henry, N. Y., is expected to go in shortly.

Buffalo Makers Refuse Business

Buffalo, Oct. 7.—Little of any iron is being sold in the Buffalo district. All furnaces are refusing to accept new business, although inquiry is brisk. Export inquiry for 12,000 to 15,000 tons of basic has been before one Buffalo maker, but it is not being considered. Domestic inquiry is good for No. 1 and No. 2 grades of foundry iron. This inquiry is in lots of 1000 to 2000 tons. The delivery specified is first quarter, but none is being taken. The price on some of these grades of iron, contracted for previous to the strike, was $29 and $30. The East, particularly, is furnishing considerable inquiry. Almost all the furnaces in this territory are sold up, and even if a strike were not in force, it is doubtful whether there would be a great deal of business just at this time.

Prompt Iron Snapped Up

Cleveland, Oct. 7.—Prompt iron continues in demand among consumers in this district as various consumers are running short on supplies or are casting about to fortify themselves against their needs. This situation has been produced by the continued shutting off of shipments from local furnaces now banked, and despite the fact that a large tonnage of iron is on the yards of these producers. Southern makers continue to sell various lots of prompt iron to Cleveland district consumers at $29.75, furnace, for 1.75 to 2.25 silicon, or $32.15, delivered. These sales have amounted to several thousand tons in total. Some iron also is being shipped into this district from western Pennsylvania. Off grades on the banks of northern Ohio furnaces continue to be purchased by buyers at the regular differentials under the $26.75 base. One maker in the week sold about 1200 tons of such grades. The same producer also sold 6000 to 7000 tons additional of foundry and malleable grades, more than half of which was for first quarter and first half, and all of this was accepted on the $26.75 basis. A small sale of prompt malleable at $30, Buffalo, is noted. Requests to hold up shipments of steelmaking iron to various plants which have been closed or crippled by the strike continue in effect. Shipments of iron continue to make inroads into stocks on furnace banks and the latter steadily are being reduced.

Southern Ohio Iron Up

Cincinnati, Oct. 6.—Southern Ohio furnaces have established a price of $29.75, Ironton, for silicon, 1.75 to 2.25, for shipment during the remainder of the year. It is reported that a fair sized tonnage has been disposed of lately at this figure and that it could have been increased if the furnaces were able to make deliveries. In the South operators are also inclined to make higher prices and today $28, Birmingham basis is the minimum quotation, with not much of the metal for nearby shipment to be had at this figure. It is currently reported that southern producers are not now willing to take on any more first quarter business at $29, Birmingham, but doubtless some desirable orders might still be put through at this figure. Northern furnaces still are unwilling to open their books for next year, and will probably follow the same course until they have more definite information as to what future costs will be. An advance in freight rates is said to be inevitable, while coke costs also are expected to be higher. The inquiry for next year is falling off.

Sales in South Increase

Birmingham, Ala., Oct. 7.—Sales of pig iron in the South are increasing owing to curtailment of production in the North and Middle West. A number of orders for from 300 to 1000 tons of iron have been booked. After a little selling, furnace companies in this section have withdrawn from the market for 1920. The small tonnage sold went on a basis of $29, for No. 2 foundry (1.75 to 2.25 silicon). The aggregate business for the last quarter will approach the probable make. Production is steady. The six blast furnaces of the Tennessee Coal, Iron & Railroad Co., at Ensley, Ala., produced around 70,000 tons of iron during September.

A Tennessee maker of standard low phosphorus iron has made sales during the past week or two at $38 to $40 furnace.

St. Louis Running Short of Basic

St. Louis, Oct. 7.—Buying of pig iron in small lots for prompt delivery continues active. Except for a curtailment of deliveries from the North and East, the strike has failed to affect this locality. All industries which were in operation prior to the strike are at work as usual, but it is a fact that several important steel plants were closed, and have not resumed. Several steel plants which are producing large orders are running short of basic iron because of the closing down of eastern and northern foundries. Only two weeks' supply can be figured on, and efforts are being made to induce southern furnaces to manufacture basic to supply this want. The needs will run from 12,000 to 15,000 tons. In the foundry iron line the inquiries range from 300 to 500 tons, an exception being one inquiry from a user in the district for 1500 tons of assorted foundry grades, for shipment in October and November.

Foundry Inquiry Heavy

Chicago, Oct. 7.—While there is comparatively little interest in malleable or bessemer grades, melters of foundry iron seem anxious to place further tonnages and this grade and silveries are comparatively active. Among inquiries for foundry iron for 1920 delivery is one lot of 4000 to 5000 tons, another for 2500 tons and one for 900 tons. In addition to these are many others, most of them for small tonnages. Much interest is being manifested in silvery iron, and a recent sale was made of 1000 tons from an Ohio maker to a nearby consumer, for first half delivery in 1920. The Tennessee stack which has been selling silveries freely in this market for this year's delivery has not yet opened its books for next year. Southern iron is entering the Chicago market more freely now than during recent weeks as the car situation at Birmingham seems to have improved. All iron coming to this market for account of brokers is disposed of promptly on arrival as consumers are anxious to take on whatever presents itself for certain delivery, inasmuch as the date of resumption by local stacks still is uncertain.

Make Sales at Higher Prices

Philadelphia, Oct. 7.—Although lacking in spectacular single orders, business in the pig iron market in this district the past week aggregated more than 15,000 tons of all grades. Several thousand tons of basic iron sold at close to $28 delivered and on some new business which now is under inquiry about 50 cents higher is being quoted. Several thousand tons of standard low phosphorus were sold at $36 furnace equivalent to slightly under $40 delivered Philadelphia. Several hundred tons of copper-bearing low phosphorus were sold at $35 furnace. The Standish, N. Y., furnace is expected to blow in next week on standard low phosphorus. The foundry market has been characteried by many sales generally involving under 1000 tons and practically all for this year. Iron is scarce as furnaces generally are sold up although the market still is $30.25 to $31.25 delivered, eastern Pennsylvania for No. 2X (2.25 to 2.75 silicon). Higher prices are being done as for instance several hundred tons of Buffalo No. 2X sold at $33, Buffalo for spot shipment and several lots No. 2X were sold $32, eastern Pennsylvania furnace. No. 2 plain (1.75 to 2.25 silicon) was sold at $30.50, eastern Pennsylvania furnace. The minimum of central Pennsylvania foundry iron is $29.75 furnace for No. 2X which is an advance of 25 cents. Although Virginia No. 2X still is selling at $30 furnace for early delivery, these makers are asking a premium of

$1 plus the usual differentials for higher silicons. The later now are well sold up. The minimum on malleable now is $29, eastern Pennsylvania furnace. Gray forge was sold the past week at nearly $29.50 delivered eastern Pennsylvania.

Tin Plate Output

Still Comparatively Light, Although Operations Are Improving

Pittsburgh, Oct. 7.—Comparatively few manufacturers of tin plate are unaffected by the strike, and while there has been a notable improvement in the past week, mill operations still are comparatively light. The Jones & Laughlin Steel Co., tin plate mills at its Aliquippa works, are running practically 100 per cent and the Bethlehem Steel Co, aside from a short-lived strike of its tin plate mill employes, has not suffered materially. The American Sheet & Tin Plate Co. has been making steady gains in the past week or so and now has its New Castle works running 100 per cent. This company also has started in a small way at both of its New Kensington, Pa., plants. Active demands are coming out from container manufacturers for tin plate for prompt delivery and stock lists of all manufacturers are being scanned closely for possible relief. Lots suitable for the can companies readily are moved at the full market price of $7 per base box, Pittsburgh. Several export inquiries are noted, among them one for 9000 boxes, while export sales include one lot of 2000 boxes, and another of 1600 boxes.

Ore Market

Experiences Some Renewed Demands For Foundry Grades

Cleveland, Oct. 7.—Although furnace requirements for ore were supposed to have been fairly well provided for, inquiries have come out for approximately 200,000 tons of foundry grades. The interest receiving these inquiries is unable to meet the demand, as practically all of its production of foundry ore for the season has been contracted for, although it still has a little basic ore available. Most of the ore companies have contracted for the sale of all the ore they will produce this year, and are not seeking orders, although one of the largest interests still has plenty of ore for sale.

Storage facilities at lower lake ports have been taxed to the utmost, causing a slowing up of shipments, as many vessels are waiting to be unloaded, although comparatively little labor trouble has been experienced on the unloading docks.

Following is the September statement of ore shipments and totals for the season up to Oct. 1, together with comparisons:

Port	Sept., 1919	To Oct. 1, 1919
Escanaba	939,099	3,696,996
Marquette	431,995	1,601,564
Ashland	1,190,086	4,510,176
Superior	2,033,804	8,453,318
Duluth	2,591,750	14,058,674
Two Harbors	991,749	5,455,803
Total	8,178,483	37,776,531
1919 decrease	816,531	10,552,747

Coke Still in Buyers' Favor

General Maximum on 48-Hour Fuel is $4, Ovens—Spot Situation Improves Somewhat, But Furnaces are Not Ordering

Pittsburgh, Oct. 7.—While the spot situation in beehive furnace coke has been helped to some extent by the sale of a large number of loaded cars in the North and East and the fact that a great many of the operators have been drawing their ovens at 96-hour intervals, few blast furnaces have ordered a resumption of shipments against contracts, and the curtailed production is ample for all wants. Most of the furnace interests whose stacks again are in blast had a number of cars enroute and also fair stocks. These supplies have sufficed to keep them going and new demands have been light. At present, $4, ovens, appears to be the general maximum on standard 48-hour fuel, although brokerage interests claim to have made sales in the past day or two at $4.15. On the other hand, sales have been made at $3.75 on standard coke, although it is doubtful if really good coke can be bought any lower. Some of the emergency coke sold in the lake and eastern districts went as low as $3.50. On that basis the market is 25 cents a ton higher than it was a week ago. But while the market has been getting a little stronger on furnace fuel, it has softened to the extent of about 50 cents a ton on foundry coke. Few sales of the latter have lately been made at higher than $6, ovens, except in single cars, while choice brands have been sold at $5.50 to $5.75. A week ago, $6, ovens, was the minimum on strictly standard 72-hour selected foundry coke. Some talk has been heard about contracts for first half of 1920 furnace coke, but with operators mentioning $6 or more, nothing has been done. It is said that the Clairton by-product plant of the Carnegie Steel Co., is running 80 per cent of capacity, with the ovens being drawn at intervals of 24 and 30 hours. This plant consists of 12 batteries of 64 ovens each, and 80 per cent operation means that 627 ovens are in. Before the strike, the entire 784 ovens were operating and were being drawn at 18-hour intervals. Connellsville production of coke for the week ended Sept. 27, is estimated by *The Connellsville Courier* to have been 186,120 tons, against 258,801 tons in the previous week.

Coke Needed in Alabama

Birmingham, Ala., Oct. 7.—The need for coke in Alabama has become so urgent that further attention is being given to getting beehive ovens in operation. The Woodward Iron Co. resumed work at a number of ovens this week. Foundry coke is not being offered freely by independent manufacturers. Furnace coke is gaining strength, and a little apprehension as to a strike of coal miners next month is causing producers to make an effort to accumulate supplies.

Foundry Fuel Declines

New York, Oct. 6.—The weakness in furnace coke as a result of the strike situation, which was reported last week, now has extended to foundry coke. Beehive foundry coke during the past week has been sold in this district by western Pennsylvania operators at $5.75, Connellsville, which is a decline of 25 to 50 cents. The northern New Jersey by-product coke maker continues to quote $6.50 Connellsville, equivalent to $9.60, delivered at Newark and other northern New Jersey points, on by-product foundry coke.

There are inquiries in the market for thousands of tons of foundry coke for export.

Spot Foundry Fuel Moving

Cincinnati, Oct. 6.—Spot foundry coke is in good demand, but contract business is rather light. Producers are only willing to sell ahead on a sliding scale basis. One trouble about moving spot coke is the car shortage which seems to improve one week and get worse the next. In the Connellsville field spot furnace coke is firmer. Prompt 48-hour coke from that district is now bringing from $4 to $4.25, ovens. Foundry coke for filling in purposes is being sold in the Wise county district around $7 to $7.50. What little New River coke that can be had brings readily from $9 to $9.50. Very little Pocahontas coke is being sold in this district.

Good Demand at St. Louis

St. Louis, Oct. 4.—Numerous inquiries have come out for coke, chiefly from foundries for prompt delivery. They range from 300 to 500 tons, with one for 1000 tons from an Iowa melter for delivery through the last quarter. Prices are firm, and range from $5.75 to $6.50 for 72-hour foundry coke, f.o.b. ovens. A little additional tonnage has been shipped as a result of furnaces closing down in the east. Demand is quite general, except for the steel plants. Foundries are handling all the coke received. Production by by-product ovens continues at a fair rate and makers are experiencing no difficulty in disposing of all they can produce.

Sales Made at $3.90

Philadelphia, Oct. 7.—Several thousand tons of furnace coke were sold in this district during the past week at $3.90 Connellsville ovens.

Ask Battleship Steel

Washington, Oct. 7.—The bureau of supplies and accounts, navy department, has requested tenders on 10,500 tons of plates, 3400 tons of shapes and 15 tons of bars for the construction of battleship No. 52 which is being built at the Norfolk navy yard. Bids are to be opened Oct. 17 with deliveries of 500 tons monthly to commence not later than Nov. 1, 1919.

Steel Scrap Is Up in East

Buying of Round Tonnages by Various Steel Works Stiffen Market —Conditions Lag in Other Districts

FOR COMPLETE SCRAP PRICES SEE PAGE 1022

Philadelphia, Oct. 7.—Great activity in heavy melting steel has changed completely the complexion of this grade in this district the past week. The American Bridge Co. at Pencoyd bought at least 5000 tons and probably more. The Alan Wood Iron & Steel Co. bought 10,000 tons and the Worth Steel Co. 5000 tons. This business went mainly at $19 to $20 delivered. The steel scrap market is exceedingly strong now and the grade probably could not be bought under $20 delivered. Steel mills have bought considerable forge scrap and borings and turnings for open hearth use but have been unable to get all they wanted of these grades. Cast scrap and chemical borings also are actively in demand and stronger. In fact the only grade which does not share in the betterment is wrought pipe which has weakened due to the fact most mills have dropped out of market as buyers.

Boston Market at Standstill

Boston, Oct. 4.—The bottom has dropped out of the scrap iron and steel market and few sales are reported. Delivery of several hundred tons of heavy melting steel was made to the plant of the American Steel & Wire Co., Worcester, Mass., during the week on an order previously placed, but the desire to await events is evident throughout New England. The feature of the week's activity was a fairly large inquiry from one of the eastern Pennsylvania steel mills. The Boston ordnance office sold a small tonnage of bar steel to the Arthur C. Harvey Co., at prices averaging about 2.00c a pound at place of storage. On a lot of 100 tons of steel armor plate which has been advertised for two weeks, no offer was received. The office has for sale by negotiation over 11,000 net tons of steel blooms and is taking bids on 140 tons of bessemer screw stock, 23 tons of steel forging, 30 tons of steel shells and 185 tons of round steel.

Market is More Settled

Pittsburgh, Oct. 7.—No change of note has taken place in scrap iron and steel prices here in the past week, but the market has shaken off much of the nervousness it recently showed. While a number of the steel plants are embargoed, due to freight congestions or because of the lack of sufficient common labor to unload shipments, steel manufacturers not thus situated are taking in shipments on contracts and some of them actually are making purchases. Small sales of heavy melting steel are noted at $20, delivered, and attempts on the part of some steel manufacturers to buy for less have failed. It is apparent that supplies of this grade are not particularly heavy in view of the fact that several Pittsburgh dealers made bids running anywhere from $19 to $19.65, delivered, on the Pennsylvania railroad, lines east, October scrap list and failed to receive allotments. A growing belief that the strike is practically over encourages a more optimistic feeling among dealers and they are disinclined to press for sale any tonnages that are on their hands. Foundry grades are attracting some demand.

Metropolitan Market Dull

New York, Oct. 6.—Local scrap dealers assert that the market is exceedingly dull. New inquiries are decidedly few. Material against old contracts appears to be virtually the only scrap now moving. Little scrap, it is said, is being consumed at Coatesville and Lebanon, Pa. A feature of the situation in the East is a heavy number of rejections, this being particularly true at Bethlehem. It is said that a shortage of labor in unloading the cars is a factor in these rejections. Although the market is dull, prices are showing no tendency to weaken. Bids were taken today on a large tonnage of miscellaneous scrap at the plant of the International Fuse & Arms Co., Bloomfield, N. J. More than 2000 tons of shell steel were included.

Buffalo Market Quiet

Buffalo, Oct. 7.—Trading in scrap is quiet, most of the mills remaining out of the market. There is no real inducement for them to buy, as prices, though nominal, remain firm. Shipments are being made by dealers against old contracts.

Will Scrap Equipment

New Castle, Pa., Oct. 7.—Bids are being taken by the Pittsburgh & Lake Erie railroad for salvaging 6000 cars which now are on sidings between Edinburg, Pa., and New Castle junction. The railroad, it is understood, will supply the equipment necessary for completing the salvage work while the highest bidder for scrap materials will be required to supply the labor.

Chicago Market One-Sided

Chicago, Oct. 7.—As a result of the strike among steel producers, the scrap iron and steel market is decidedly lop-sided, the strike having stopped all deliveries of open-hearth grades, while it has stimulated the demand for rolling mill material and rerolling rails. The latter comes about by the greater demand for iron bars and hard steel bars to replace soft steel, which is unobtainable. Foundries continue to take considerable cast scrap, which continues at a high level. Quotations remain much the same as they have been for a month past, with a few upward changes because of slightly increased demand. The market is considered strong and resumption of buying after the strike is settled is expected to send quotations up sharply. The Chicago, St. Paul, Minneapolis & Omaha offers 627 tons, the Wabash 1260 tons and the Michigan Central an open list.

Embargoes Bring Softer Prices

Cleveland, Oct. 7.—With Cleveland and northern Ohio continuing to be a storm spot of the strike, scrap iron and steel has become much weaker. Melters still are embargoed, and even dealers are not anxious to trade among themselves. Yards are full, with more material coming in than going out. Prices on most grades are softer. Heavy melting steel has been marked down to $18 to $18.25, while No. 1 busheling now is $17 to $17.50, axle turnings are $15 to $15.50, machine shop turnings $8.25 to $8.50, and borings $12.25 to $13.50. Dealers look for a marked revival and higher prices once melters begin buying again.

Foundries Are Buying

Cincinnati, Oct. 6.—Local and nearby foundries have lately been quietly buying additional scrap to carry them through the year. The heavy melt of foundry scrap recently has somewhat upset calculations. As a rule neither buyer nor seller is very anxious to do business for shipment next year, and for this reason transactions are light. Encouraging rumors are circulated as to the chances for an early lifting of difficulties in shipments to the Pittsburgh district. Steel scrap is unchanged and is a trifle firmer.

Buying Slowing Down

St. Louis, Oct. 4.—Conditions in the scrap iron and steel market are confused and list prices are largely nominal. On the whole the market is steady, and scrap dealers say they will sell only at their own figures, although they have large stocks. The strike has halted consumptive buying though thus far it has not reduced consumption. Melters are using up what they have heaped and are asking for contract deliveries. The Baltimore & Ohio and Louisville & Nashville railroads, which were to have put out lists this week, announced they will be withheld indefinitely. The rolling mills are taking all the material being shipped to them, and their business is good. The leading interest has some large orders, and will be obliged to enter the market before long to fill them. The St. Louis Screw Co. closed down two weeks ago for repairs and overhauling, but has resumed operations. Foundries throughout the district continue extremely busy. The Cotton Belt railroad had a list of approximately 500 tons this week, and the St. Louis Terminal Railroad association 400 tons.

Prospects Brighter in South

Birmingham, Ala., Oct. 7.—Demand for scrap iron and steel in the South is improving. The lull caused by the strike is passing and consumers are inquiring for more material. There is a good assortment of scrap in the southern yards. Quotations show no change. The railroad car situation is improving, but little demand is coming from other districts.

Rising Tonnage

Is Shown in Sheets—Largest Producer Now at 80 Per Cent

Pittsburgh, Oct. 7.—While a few of the independent sheet manufacturers have been forced to curtail through lack of sufficient supplies of sheet bars, the more common report is that mill operations are expanding as a result of the return to work of a number of men who have been out. The American Sheet & Tin Plate Co. now is operating 80 per cent of its sheet mills. Its Mercer works at Farrell, Pa., which were started on Sept. 30, now are running 75 per cent, while 91 per cent of its mills at its works at Vandergrift, Pa., are operating. Independent sheet mill operations are averaging about 50 per cent of capacity. Production of sheets is considerably behind orders and a number of consumers are seeking supplies for prompt shipment.

No Effort to Start Mills

Youngstown, O., Oct. 7.—Mahoning valley sheet mills still are inactive due to strike conditions. Practically all the mills here were operated largely by members of the Amalgamated association who were compelled to quit work on account of the laborers, electricians and cranemen striking. No effort is being made to operate the sheet mills. Sheetmakers are not taking on any new business. However, regular customers are being looked after. Activity continues in the spot market according to dealers here. Considerable tonnages of various grades of sheets have been sold recently at prices from $5 to $10 above market quotations. New buyers are coming into this district frequently for all grades of sheets and, from their inquiries, are willing to pay attractive premiums on material for early delivery. On the other hand considerable tonnages of open-hearth blue annealed from 6 to 11 gages are available at considerably lower than market prices.

Buying Odd Stocks

Chicago, Oct. 7.—Heavy demand exists for steel sheets. However with the leading independent out of the market on account of strike conditions and with sufficient tonnage on his books to run into next year, the supply in this district is much curtailed. The leading interest is producing to some extent but is much hampered by the strike and is falling behind constantly on orders. As a result the market is being combed for odd lots and some brokers are advertising for such stock.

Old Orders

Receive Attention in Tubular Goods as Output Grows Slowly

Pittsburgh, Oct. 7.—Aside from the fact that the Steel & Tube Co. of America again is operating at Indiana Harbor, Ind., and that Spang-Chalfant & Co., Pittsburgh, have resumed in part, no especial change has taken place in the past week in pipe mill operations. The Youngstown, O., manufacturers have not yet resumed, but the Jones & Laughlin Steel Co. continues to operate its pipe mills full and the National Tube Co. which suffered the loss of only one of its plants, the Riverside works at Benwood, W. Va., is doing better this week than it did last week. The National works of the latter company at McKeesport, Pa., is operating practically full and it has been able to maintain substantially 100 per cent operations at its Lorain, O., works, while at Ellwood City, Pa., operations were only slightly affected and it is now reported that the plant is running just as if the strike had never been called. The National Tube Co. has made no effort to open up its works at Syracuse, N. Y., which is a spare plant. Plenty of new demands are coming out for both lapweld and buttweld pipe, but filling old orders is receiving the chief attention of producers.

Private Demand Maintained

New York, Oct. 6.—Private demand continues to be the mainstay of the eastern cast iron pipe market. A couple of sizable tonnages reported recently for Hartford, Conn., and Harrisburg, Pa., are pending, but little new is coming out in the way of public work. Prices are holding firm at the advance of $2 noted recently.

Western Inquiry Slack

Chicago, Oct. 7.—Although a number of contracts for cast iron pipe are under consideration by municipalities, new inquiry is slack and for small tonnages. Detroit, which has been the best customer the present season, has under consideration one lot of 5000 tons and another of 2000 tons, on neither of which has a decision been reached. The United States Cast Iron Pipe & Foundry Co. has taken 100 tons at Milwaukee.

Some Shortage

Appearing in Sheet Bars as Finishing Operations Increase

Pittsburgh, Oct. 7.—Some of the sheet and tin plate manufacturers whose regular sources of supply of sheet bars temporarily are shut off by the labor disturbance lately have been in the market for supplies and have found the offerings rather scant. Finishing mill operations seemingly are increasing a little more rapidly than the production of sheet bars and a number of mills appear to have exhausted their stocks of steel. The leading interest reports no difficulty in this direction, although it is now operating 80 per cent of its sheet mills as against about 60 per cent around the day of the walkout. A northern Ohio steel company which had a fair sized stock of sheet bars on its yards when the strike broke out, reports the sale of 500 tons in this district at the regular market base. Inquiry for 5000 tons of sheet bars is reported by a Pittsburgh steel company. Shortage of billets also is rather marked although not quite so acute as that in sheet bars. Few wire rods are available at present.

Strip Operators Gain

Pittsburgh, Oct. 7.—With the resumption in part of the plant of the West Leetchburg Steel Co., Leetchburg, Pa., production of strip steel in this district again is approaching normal. The Superior Steel Corp., the plant of which is at Carnegie, Pa., has not been affected by the strike, and the strip steel mill of the Weirton Steel Co., Weirton, W. Va., now is reported to be back at 100 per cent after a short, light curtailment.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead, New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot
Oct. 1	23.50	53.75	6.25	7.00	33.00	8.50	41.00

Oct. 3	23.50	54.25	6.25	7.15	33.00	8.50	41.00
Oct. 6	23.50	54.25	6.25	7.30	33.00	8.50	41.00
Oct. 7	23.50	54.50	6.25	7.35	33.00	8.50	41.00

* October shipment from Singapore.
† American Smelting & Refining Co.'s price.
‡ Producers' price. Outside market, Oct. 1, 21.35c; Oct. 2, 21.25c; Oct. 3, 21.25c; Oct. 4, 21.25c. Lake, 22.00c; casting 20.00c to 20.25c.

NEW YORK, Oct. 7.—The effects of the steel strike continue to be reflected in the nonferrous metal markets, which remain extremely quiet. However, the favorable news from the strike centers has kept sentiment cheerful and prices have been holding steady. In fact, a few inquiries for prime western zinc came in the market last Friday from galvanizers, which put new heart in the market for prime western zinc. Prices advanced from 7c, East St. Louis, on Thursday, to 7.15c, on Friday, and to 7.35c and 7.40c on Tuesday.

A fairly large tonnage of electrolytic copper was sold through the Copper Export association to Germany recently, satisfactory credit arrangements having been made. A large domestic consumer bought about 500 tons of electrolytic. Domestic business generally continued extremely slow. The leading producers continued to ask 23.50c for early delivery copper. Second hand sellers asked 21.25c for spot and October delivery, 21.50c for November and December.

The truce in the English railroad strike brought about a good recovery in the British tin market also at Singapore, which was reflected in a stronger market here. Inquiry from consumers has been so light that few transactions have been closed and consequently the market has been hard to establish, but inquiry from plate mills and alloy makers is in. Straits tin prices for October shipment from Singapore ranged from 53.50c to 54.50c, f.o.b. New York, while November-December shipment prices were about the same level. Spot Straits tin is quoted 55.25c and spot electrolytic 54.75c to 54.87½c. Spot 99 per cent tin is quoted 54.25c to 54.37½c.

Bar Users Still Are Patient

Refrain From Pressing Mills Though Demand is Heavy—Automobile Plants Not Yet Feeling the Pinch

Chicago, Oct. 7.—Inquiry for soft steel bars is heavy, but seekers after tonnage are not insistent, and, realizing the situation because of the strike, they are awaiting deliveries with patience. The leading interest is willing to accept whatever business is offered, with the proviso that deliveries depend upon circumstances and cannot be definitely promised. On this basis considerable business has been booked. The leading independent had sold its production for the remainder of the year before the strike stopped operations and therefore is entirely out of the market, as it has not yet opened its books for next year. Some tonnage of practically all finished steel has been placed for 1920 delivery with the leading interest.

Bar iron mills are running at top speed because of the flood of business placed by steel bar users, who are forced to substitute iron bars wherever possible. This is in marked contrast to the former position of these mlils. Hard steel bars rerolled from rails are also in strong demand as substitutes for soft steel bars, and all producers in this line are busy. Some are quoting up to 3.00c mill on rerolled bars.

Hard to Place Orders

New York, Oct. 6.—The leading producer of steel bars has not permitted the strike to make any change in its selling policy. It continues to take orders the same as before, but is taking them only from its regular trade, and for minimum requirements. As far as can be learned, the strike at the steel mills has not affected operations at consuming plants in this territory. This condition is attributed to the fact that consumers have stocks which will maintain their operations for sometime. In the meantime they continue to receive shipments from the mills in operation. Some bar tonnage now is being sold at 2.50c, Pittsburgh, to which figure several of the mills advanced some weeks ago. Business continues also to be placed at 2.35c, Pittsburgh.

The old price of 2.35c, Pittsburgh, on iron bars, at which some business was being booked, despite the advance to 2.50c, Pittsburgh, seems to have disappeared. The bottom of the market now is 2.50c.

Difficult to Get Delivery

Philadelphia, Oct. 7.—Bars continue hard to get due to the fact western production is hampered by the strike. Hence many users are not getting deliveries on their contracts. Reports are heard there is some likelihood that after strike is ended some makers who advanced bars to 2.50c Pittsburgh may go back to 2.35c.

Consumers Help Manufacturers

Pittsburgh, Oct. 7.—Although the requirements of merchant steel bars are heavy, consumers are not pressing the mills for deliveries against contracts and because of this condition the curtailment of production has not resulted in anything like an acute shortage. Fair demand exists for iron bars with most makers unaffected by the iron strike, due to the agreement of Amalgamated Association of Iron, Steel & Tin Workers. The base on common bar iron is 2.75c Pittsburgh but some makers claim to have made carload lot sales on a basis of 2.80c and 2.90c Pittsburgh.

Strong Demand at Buffalo

Buffalo, Oct. 7.—Barmakers in this district report strong inquiry with the demand for tonnages from 500 to 1500. Some shipping from stock is being done in limited quantity. There have been no cancellations.

Manufacturing Stocks Disappear

Cleveland, Oct. 7.—No signs of distress among consumers of steel bars and other finished material in this district yet are manifest. It is evident, however, that unless shipments by the mills are appreciably increased and what is more important, unless a better assortment of sizes is finished, operations of various consumers are likely to be considerably affected in the near future. Large automobile builders in this district are well supplied for two to four weeks but unless there is some improvement in the volume of deliveries with that period, it is probable that a considerable curtailment of their operations will be forced. Efforts of consumers to buy steel have not been so vigorous the past week as in the period preceding. A lively demand, however, continues and this is especially true from the warehouses, since the mills are taking new business either for indefinite delivery or not at all. Reinforcing bars are stronger. Rerolling mills are quoting 2.75c mill and one western producer is understood to have raised his price to 3.00c mill. Producers rolling from new steel who have been waiving the 7½ cents for 100 pounds twisting charge, now are strictly enforcing this extra.

Better Deliveries Expected

Pittsburgh, Oct. 7.—With the decline in the force of the strike and better operations of the hoop and band mills, deliveries against contracts, which recently were somewhat restricted, are expected soon to be better. Some makers of band steel are heavily committed and were not able to accumulate much reserve stock for shipments against contracts. This is not the case, however, with hoops and cotton ties.

Strike Not a Factor

Pittsburgh, Oct. 7.—The walkout of steel plant laborers has neither affected the demand for, nor the production, of cold-finished steel bars and shafting. The leading makers in this district report full complements of workmen and while there has been some interruption here and there in the supply of merchant steel bars, it has not been sufficient to materially affect production. Meanwhile the demand continues good, especially from the automobile and tractor builders.

Bolt Buying Heavy

Chicago, Oct. 7.—Demand for bolts and nuts continues strong, and plants are being operated at the highest pitch with more business offering than can be accommodated.

English Ferro

Again Being Quoted With Price $110 Seaboard—Spiegel Defined

New York, Oct. 6.—One importer of English merromanganese has been authorized by its English principals during the past week to sell English ferromanganese here at $100, c.i.f. Atlantic ports. This price, considering exchange, etc., is said to be equivalent to the figure quoted by the British producers in their home market. This is considerably under the price at which another importer has sold English metal during the past week. The latter sold about 200 tons at $110, freight allowed to destination. No sales yet have been made at the $100 price. Consumers are not anxious as a rule to buy, due to the strike situation. Domestic makers continue to quote $110, delivered, on 78 to 82 per cent. The English metal offered is not guaranteed to contain more than 76 per cent manganese.

A real test of the spiegeleisen market was afforded during the past week when a large western consumer came into the market for 500 tons for the rest of this year. The metal was obtained at a price which shows the market is $34 to $35, furnace, for 18 to 22 per cent.

The ferrochrome market continues irregular. Makers' quotations nominally are 28.00c per pound contained, for large lots, 4 to 6 per cent carbon, but there are reports this price is being shaded.

Some inquiries for 50 per cent ferrosilicon from France have been in the market. In view of the large stocks of this alloy in France and England, however, it is believed these merely are for the purpose of sounding the market. American makers continue to quote $95 to $100 a ton, delivered, while actual business is being done in carload lots at $82 to $83, delivered.

Business on a Moderate Scale

Pittsburgh, Oct. 7.—Few demands are coming out in this district for ferromanganese and sales are so limited and small that prices are indefinite. Some domestic producers are quoting 78 to 82 per cent at $110, delivered, but it is known some English makers are quoting $100 c.i.f. Atlantic seaboard, which, they claim is the same price that is being quoted in England, equivalent to about $105 delivered, Pittsburgh district. One agent here of an English producer a few days ago received official notice that a price of $95 c.i.f. Atlantic ports, had been withdrawn. This producer

at the same time withdrew from the market.

The recent inquiry for 400 tons of spiegeleisen, it turns out was from the Griffin Car Wheel Co. which covered this tonnage, for its Boston and Detroit plants, below $34, furnace, for 18 to 22 per cent.

Only carloads of 50 per cent ferrosilicon are wanted or are being sold and the price is right around $80 furnace, freight allowed, for bulk shipments. A Canadian manufacturer is quoting $85, delivered Pittsburgh, for packed shipments, and allowing a charge of $6.50 a ton for packing and package which would mean less than $80 in bulk. A few small sales of 20 to 25 per cent ferrosilicon are noted by electric furnace interests at $55, delivered Pittsburgh district. This price is less than is being asked for 11 to 12 per cent bessemer ferrosilicon and the demands for the latter consequently are small.

Wire Delivery

Falls Behind Schedule—New Orders Declined—Nail Shortage Likely

New York, Oct. 6.—Owing to the large percentage of the country's wire industry tied up by the strike, the makers affected are unable to make deliveries on contracts in accordance with schedules. Hence, many consumers are not getting the usual flow of material. However, the stocks on hand at consuming plants, combined with the fact that eastern mills continue to operate and ship, counteract the effects of the strike in the east, and no consuming plants have been forced to shut down, or, as far as known, curtail their operations. The mills are exceedingly careful about booking new business.

Not Taking Any New Business

Pittsburgh, Oct. 7.—Manufacturers of wire and wire products whose mill operations are undisturbed by the steel plant strike and who have had some tonnage available for prompt delivery, find it extremely easy to make sales at the higher quotations established by most of the independent companies several weeks ago. As a general proposition, however, no new business is being accepted by manufacturers, for while some of those plants recently down now are in operation, production is well taken up for some time to come. Makers are disinclined to enter orders for distant delivery. A shortage of nails is expected over the remainder of the year as building operations are on a much heavier scale than is generally reported. The curtailment of production recently has thrown heavy demands upon the jobbers and their stocks are understood to be badly depleted. The Cambria Steel Co., Johnstown, Pa., and the Youngstown Sheet & Tube Co, still are idle, but the American Steel & Wire Co. notes a steady increase in production at several of its plants which were down and the Pittsburgh Steel Co. and the Page Steel & Wire Co., both of Monessen, Pa., resumed operations Monday following a two-weeks suspension. The Jones & Laughlin Steel Co. is running its wire mills practically full.

Plate Orders Are Large

Pennsylvania Railroad Places 25,000 Tons for Car Repairs—Navy Wants Big Tonnage—Many Boats Are Being Let

New York, Oct. 6.—The number of boats which are involved in pending inquiries is increasing. One eastern yard is figuring on 10 vessels which in some quarters are said to be practically closed, and four yards are figuring on two boats each. In addition many inquiries for boats which came out some time ago have been dragging along.

The most important plate business for sometime is the placing, by the Pennsylvania lines east of 25,000 tons of plates for car repairs. In addition, this road now is negotiating for 2000 tons.

According to plate makers, the 2.50c, Pittsburgh, price which recently figured to a considerable extent in some large transactions, now is practically a thing of the past. All makers declare they are firm at 2.65c, Pittsburgh. Export business continues to develop in plates. A Japanese interest just has placed an order for 1000 tons.

Boats Are Being Placed

Philadelphia, Oct. 7.—Eastern plate mills report the biggest bookings since the armistice were entered during the past week. Not only has shutdown of some of the western mills increased the demands upon eastern makers but many projects which had been held up, now are being closed. The past week's bookings included not only boat, locomotive and car plates but steel for many other uses, not the least of which is for general fabrication work. All signs now point to considerable activity in shipbuilding. Pusey & Jones have taken two ferryboats for the Reading railroad. A Baltimore yard has taken two large vessels and several yards expect to close contracts for vessels shortly. The navy department will open bids Oct. 17 on 22,000 tons of plates and 6800 tons of shapes, half for Mare Island and half for Norfolk. Export plate business is good and mills in Consolidated Steel Corp. are getting more than usual. Production at Coatesville now is the same as before the strike or greater because of the increase in orders. More men applied for work at the Lukens Steel Co. plant yesterday than could be used.

Not Shading March 21 Prices

Pittsburgh, Oct. 7.—Demands upon the plate manufacturers whose plants are in operation still are extremely heavy from buyers who are not getting shipments against contracts placed with regular sources of supply. Makers having any tonnage for sale not only are getting 2.65c, Pittsburgh, on all new business, but also are showing an inclination to decline anything that appears to be an unattractive tonnage.

Japanese Order Plates

Chicago, Oct. 7.—In spite of the strike of steel workers, some tonnage of steel plates is being turned out and shipped by the leading interest in this district although the production is only a fraction of the usual amount. While the tonnage is not large, it helps out on the needs of those who have small stocks and it is believed within a week larger quantities will be possible. Japan is in the market for considerable tonnage of plates and recently placed an order in this market for 1500 tons. Most domestic users are holding off on account of labor conditions and a number who would place considerable tonnages are not now actively in the market.

Warehouse Stocks

Being Depleted Under Active Demand —Bars and Sheets Active

New York, Oct. 6—The strike is working at conflicting angles in the local warehouse market. While the warehouses are confronted with a steadily increasing demand from consumers, jobbers also are having difficulty in replenishing their stocks. Consequently some lines of warehouse materials are getting low. This situation is causing some anxiety among jobbers. Prices are unchanged. Steel bars perhaps are the most eagerly sought of all warehouse materials, although demand for sheets continues heavy.

Competition's Scope Widens

Philadelphia, Oct. 7.—Philadelphia jobbers are meeting with considerable competition from New York jobbers, especially with buyers located near Philadelphia in the general direction of New York. Occasionally the New York jobbers are taking business in Philadelphia proper. This they are able to do because Philadelphia warehouse prices are based on differential of $1 per 100 pounds over mill figures, whereas the New York jobbers still are adding 75 cents.

The Pittsburgh basing system, in shipments to out-of-town points, is being observed by local warehouses when the business is in competition with Baltimore jobbers, since the latter also are using Pittsburgh as a basing point in such cases. In selling to consumers who are in New York-Philadelphia competitive territory, however, the old equalizing system of quoting is used, since this system continues to be maintained by the New York interests. By this system the difference in the freight rates, respectively, from New York and Philadelphia to the point of shipment is added to or subtracted from the warehouse price in New York or Philadelphia.

Demand for iron and steel out of stock in this district has increased greatly because of the strike and consumers are calling upon the warehouses for much of material which they otherwise would get from the mills. The most active product is steel bars. Sheets also are active.

Shape Inquiry Holds Up

Tonnage Offered for Bids Close to High Record Since Armistice —Good Awards at New York and Chicago

Pittsburgh, Oct. 7.—While makers of structural shapes are not heavily provided with orders, and some of them have tonnages available for export, the effect of the strike upon the situation has been almost negligible. Inquiries for fabricated steel still are heavy. Reports to the Bridge Builders and Structural society for the week ended Sept. 27, show that the fabricating interests reporting to this society bid on inquiries aggregating about 38,000 tons. This total has been exceeding only in two weeks since the signing of the armistice last November. Actual lettings in that week amounted to about 8000 tons or about 56 2-3 per cent of the theoretical capacity of the independent fabricating shops. Prices quoted against new structural projects still take a wide range. On the 400 tons required for the new car shops of the Pennsylvania railroad lines west, at Stark, O., bids are reported to have ranged from 3.975c to 5.40c.

No Deliveries Are Promised

Boston, Oct. 7.—Deliveries of structural steel have practically stopped, and although the mills are taking orders for future delivery no promises as to dates will be given. This has had the general effect of holding up projected work. The total tonnage let during the past week shows a marked decrease. On many of the smaller jobs where construction had started, warehouse stocks have been used for completing the work. Plans are being prepared for the Federal Reserve bank which will take 4500 tons. The First National bank is planning one of the finest bank buildings in New England.

Round Tonnage is Placed

New York, Oct. 6.—Three orders, involving more than 13,000 tons, have just been placed in the eastern structural market with the American Bridge Co. These contracts comprised 5600 tons for the Duquesne Light & Power Co., Pittsburgh; 5500 tons for the Baltimore & Ohio railroad bridge over the Allegheny river; and 2300 tons for the Southern railroad bridge at Chattanooga, Tenn. Some smaller awards also have been made. Although new inquiries have not been numerous, some of these have been fairly sizable. One of the largest is 1000 tons for the Consolidated Candy Co., Jersey City. Another calls for 1200 tons for an ice plant at Norfolk.

Good Demand in East

Philadelphia, Oct. 7.—Demand for shapes upon eastern mills in the past week was better than any time previous since the armistice. One mill reports it booked enough tonnage to occupy it a month. Most of it was for fabricated work, but some was for shipbuilding. There is considerable export business including round tonnages for Argentina, East Indies and Japan. Included in export orders was one for 200 tons for repairing windmills in France and Belgium.

New Projects Held Up

Cleveland, Oct. 7.—Demand for structural shapes in large tonnage for new building enterprises has fallen off to an appreciable extent, although orders for small lots continue to come out in fair volume. Fabricators attribute the hesitancy in regard to new projects to the general unrest in the labor situation, fully a score of large jobs in the Cleveland district being held back on this account. A similar condition prevails in the Detroit district where many large jobs have been figured. It is understood however that the general contract for the Cleveland Trust Co. building, about 10,000 tons, has gone to a local contractor on a percentage basis. An apartment hotel at Detroit, 1200 tons, has been placed. The Templar Motor Co., Cleveland, and the Ohio Blower Co., Cleveland, have let general contracts to the Hunkin, Conkey Construction Co., for new buildings, which will require a fair amount of structural shapes. Eastern Pennsylvania mills are making some sales of plain material into this district for prompt shipment at 2.75c Cleveland and 2.58c Pittsburgh representing in effect a premium of $2.60 per ton.

West More Active

Chicago, Oct. 7.—Building operations in the west continue to show much activity and each day sees further inquiry for structural material while numerous contracts are being placed with fabricators. The largest tonnage placed recently involves 1232 tons for the Bank of Italy, at San Francisco.

CONTRACTS PENDING

Manufacturing addition for A. O. Smith Corp., Milwaukee, 600 tons to Worden-Allen Co.

Garage and service building for American Automobile Co., Milwaukee, 100 tons to Worden-Allen Co.

Power house for United States Glue Co., Carrollville, Wis., 100 tons to Northwestern Bridge & Iron Co.

Hotel building for Eau Claire Hotel Co., Eau Claire, Wis., 250 tons to Worden-Allen Co.

Manufacturing buildings for Diebold Safe & Lock Co., Canton, O., 500 tons to Northwestern Bridge & Iron Co., Milwaukee.

Factory building for Fowler Nail Co., Buffalo, 250 tons to John W. Cowper Construction Co., Buffalo.

Bank of Italy at San Francisco, 1232 tons, to Golden Gate Iron Works.

Grain elevator for the Southwestern Milling Co., Kansas City, Kans., 461 tons, to Kansas City Structural Steel Co.

Building for the Meadows Mfg. Co., Bloomington, Ill., 240 tons, to independent shop.

Roof covering present crane runway for the Nash Motors Co., Kenosha, Wis., 197 tons, to Milwaukee Bridge Co.

Office building for A. W. Shaw Co., Chicago, 187 tons, to Hansell-Elcock Co.

Roof over yard crane runway for the National Malleable Castings Co., Chicago, 172 tons, to Morava Construction Co.

Manufacturing building for Gormeley & Jeffery Tire Co., Indianapolis, 186 tons, to Stone & Webster.

Two oil tanks for Sinclair Refining Co., at Tremeley Point, N. J., 500 tons, to American Bridge Co.

Apartment hotel, Detroit, 1200 tons; to Russell Wheel & Foundry Co.

Bridge at Columbus, O., for the Pennsylvania railroad, 400 tons to the Mt. Vernon Bridge Co.

Five buildings for Pennsylvania highway department, 300 tons; to Belmont Iron Works.

Armory, Troy, N. Y., 1000 tons; to Phoenix Bridge Co.

Building at Allentown, Pa., for International Truck Co., 1000 tons; to Phoenix Bridge Co.

Building for Shipley Supply Co., Brooklyn, 300 tons, to Aerican Bridge Co.

Power plant for Duquesne Light & Power Co., Pittsburgh, 5600 tons, to American Bridge Co.

Bridge for Baltimore & Ohio railroad, Alleghany river, 5500 tons, to American Bridge Co.

Bridge for Southern railroad, Chattanooga, Tenn., 2300 tons, to American Bridge Co.

Fertilizer works for war department, Chrome, N. J., 250 tons, to independent shop.

CONTRACTS PENDING

Building for John Crerar library, Chicago, 1450 tons, bids in.

Hotel for Blackhawk Hotel Co., Chicago, 1900 tons, bids in.

Theater building, Des Moines, Iowa, 119 tons, bids being taken by the Sugarman Construction Co.

Bridge at Homedale, Idaho, 290 tons, bids in.

Plant for William R. Johnston Mfg. Co., Chicago, 250 tons, bids in.

F. D. Chase, Inc., Chicago, engineer.

Factory for Consolidated Candy Co., Jersey City, 1000 tons, bids pending.

Ice plant at Norfolk, Va., 1200 tons, figures being taken.

Federal Reserve bank, Boston, 4500 tons; plans being prepared.

Beach telephone exchange building, Boston, 700 tons; plans being prepared.

Rail Buying

Is Approaching as Chicago Mills Negotiate for 100,000 Tons

Chicago, Oct. 7.—Interest in steel rails for delivery in 1920 is being manifested by numerous railroads, but so far no contracts have been made covering this delivery. Several lots required by western railroads are now being negotiated to an aggregate of at least 100,000 tons. Car inquiry is small and the active business now being considered consists principally of passenger cars and special equipment. The Manila railroad is inquiring for 25 coaches, the Atlantic Seaboard Dispatch line for 50 refrigerator cars, the Nickel Plate for 11 passenger cars and the Arms Palace Horse Car Co. for 25 cars. The inquiry of the Union Tank line for 1000 tank cars is being delayed because of strike conditions but will be reinstated when the situation clears.

Track Materials Doing Little

Pittsburgh, Oct. 7.—New demands upon the makers of standard rails are few and small and in the past week or so a considerable falling off in the inquiries for light rails has been observed. Nothing lately has been heard relative to a possible order for 200,000 tons of standard rails by the railroad administration rumored several weeks ago. Railroads are buying standard spikes merely as they are wanted but demand for small spikes still is active with most makers out of the market for the year.

Prices for Exports Advancing

Higher Quotation on Bars—Holland and Japan Sending Large Inquiries for Ship Plates—Orient Has Great Pig Iron Need—South American Business Flourishing—Prospective Railroad Requirements Extensive

NEW YORK, Oct. 6.—Although the strike has delayed shipment of material purchased on old contracts exporters report a great increase in inquiries from abroad and in a number of cases quotations are being made. If the mills were willing to take on the business offered, it is declared the export sales during the first week of October would exceed that of any week during September. There have been a number of inquiries from England and nearly all countries of Europe have shown some interest. Sales of shapes and plates have been unusually brisk, these going to China, England, Japan, and even France. One eastern plate maker has about sufficient foreign business to keep his plant busy the remainder of the year. The business from South America has continued to grow and the indications are that the foreign sales during October will establish another record for this country.

Domestic mills, however, are not quoting on new business, due to the strike, and the exporters are inclined to take chances on the market. Foreign inquiries are being answered, but the exporter has felt constrained to add a little to the domestic price in order to protect himself against a possible rise. In some instances, it is understood, the exporters' quotations are 10 per cent higher than the last prevailing domestic price.

Deliveries Are Difficult

Deliveries of wire products and nails are extremely difficult, but export sales contracts are protecting the sellers of these commodities. Deliveries of rods are somewhat easier, and in but few cases have shipments of tin plate been held up on account of the strike. In other lines the export trade has experienced little dislocation. Exporters feel confident that the strike cannot last much longer. It was pointed out that due to the railway strike in England, now settled, and other industrial disturbances there foreign buyers were compelled to turn to the United States. Individual exporters are anticipating a recurrence of these conditions when they hope to be able to reap a rich harvest in locating goods for prospective customers. It is the expectation which has prompted some of the houses to speculate on the future market, add a protective commission and send a quotation to foreign inquirers.

While it is pointed out that mills generally are not putting any new business on their books, it is true that regular customers abroad are not being disappointed. New business has been placed since the beginning of the strike. Some small shipments of galvanized sheets and steel plates have been made to Italy at the prevailing prices. Some small shipments of pig iron have been made to northern Europe.

English business has fallen off, but this is due, it is felt, more to the labor troubles in England. It was noted that a recent London inquiry requested a quotation on a small tonnage of steel bars. The bars, it is understood, are for delivery in South Africa. Another new British inquiry was for boiler tubes. Export houses having commitments to deliver to English purchasers today directed their agents to forward the goods to port, believing that steamships will be ready to accept and transport the material by the time it arrives.

Holland has been sending in an unusual inquiry for ship plates. One small house alone has in hand a Dutch inquiry for 12,000 tons of plates and it is reported that similar inquiries are scattered throughout the market. American firms are hurrying their quotations on these inquiries for it is feared that German mills will be competing in Holland before long and when that comes the market probably will be cut off. France has purchased a few hundred tons of wire rods and Spain has been buying tin plate, bars and structurals in small quantities.

There has also been shown an increased interest on the part of the Near East. From the nature of the inquiries it is believed these are based upon agricultural needs. Greece is said to have purchased $25,000,000 worth of Canadian goods and is planning to buy more. The Canadians have also been given orders from Belgium and Roumania. Representatives of these countries have been in the American market for some time past but were unable to arrange credits. They are back again and beginning negotiations with American iron and steel producers.

The Belgian government is said to be negotiating with an American company on an order for 400 locomotives, the cost of which will be approximately $20,000,000. The deal involves locomotives of the heavy freight type to be used in the rehabilitation of the transportation lines of the country. Many foreign powers are said to be planning to let orders here for railway equipment but are awaiting the completion of financial arrangements.

Strike Investigators Urge Americanization

Washington, Oct. 7.—Americanization of all industrial workers immediately will be one of the recommendations of the senate committee on education and labor as the result of its investigation of the steel strike.

Senator Kenyon of Iowa, chairman of the committee, is planning to urge congress to take steps at once to provide for a plan of Americanization. There is a bill before the committee which provides for federal action.

"The question of Americanization is most important," said Senator Kenyon, "and I have paid very close attention to the evidence which has borne upon this subject, and I believe we have received some valuable information."

Evidence submitted to the committee by both parties in the steel strike has shown that a large percentage of the workers engaged in the steel industry have little knowledge of the English language and consequently can not understand American methods.

Senator Kenyon refuses to allow the Americanization question to be confused with charges that foreigners are leading the steel strike, but he takes the position that in order for citizens of the United States to have a proper conception of the form of government, and to understand the steps they are taking, they must have a knowledge of the English language.

No attempt has been made as yet by Senator Kenyon or other members of the committee to draft a formal report on the investigation of the steel strike and none will be made until the investigation is officially closed.

Strike is Steadily Breaking Up

Workers Returning Wherever They Are Given Protection—Martial Law Prevails in Chicago District, While 4000 of 6000 Inland Steel Co.'s Employes Go to Work—Mills in Pittsburgh District Resume

STRIKE conditions in all districts affected in the iron and steel industry show considerable improvement, and wherever protection is being afforded to workmen they are returning to the furnaces and mills in increasing numbers. The most notable improvement is reported in the Pittsburgh district, a number of large plants having resumed operations without any difficulty. In the Chicago district the Inland Steel Co. is resuming operations at its plant in Indiana Harbor, 4000 of its 6000 employes having returned.

The strike in the Chicago district is reported to have reached the breaking point, Gary, Indiana Harbor and East Chicago now being under martial law, a condition which will insure the safety of the thousands of men who have indicated a desire to return to work. General Leonard Wood is in charge of 4000 United States troops at Gary, where a riot occurred last Sunday, and state and federal authorities declare order will be maintained

Mills in the Youngstown district are preparing to resume operations, as are those in the Cleveland district. In both of these districts men are returning to the mills in sufficient numbers to warrant operations. Employers say they would experience little trouble in operating their plants with their loyal employes if the local authorities were to take the necessary measures to safeguard the rights of American workers against the threats of the lawless element. The fact that the strikers are steadily losing ground, it is feared, may cause outbursts of violence, and for that reason many companies are not risking the danger to life and property in operating before sufficient protection is given.

More units are operating in the Buffalo district, and in eastern Pennsylvania conditions are reported to be normal. In the southern district, the St. Louis district, and in New England no vestige of the strike remains, despite efforts of trade union leaders.

Rapid Progress in Pittsburgh District

PITTSBURGH, Oct. 7.—Failure of the steel plant strike in the Pittsburgh district is indicated more strongly by the resumption of operations at plants located in districts which have been looked upon as hotbeds of radical labor activity. The plants of the Pittsburgh Steel Co., and the Page Steel & Wire Co., both at Monessen, Pa., which shut down even before the strike became effective, resumed operations Monday, while the Donora, Pa., steel, wire and zinc works of the American Steel & Wire Co., which suspended on Sept. 22 started up Monday, and on Tuesday had more men back at work.

The fact that resumption at these plants was unattended by disorder supports the belief of plant officials that more men mill soon return.

In the Allegheny valley and other districts where radicalism is rampant, a definite break in the strike has occurred. At New Kensington, the American Sheet & Tin Plate Co., on Monday started up both of its plants while the West Leechburg Steel Co., the plant of which is at Leechburg, Pa., and has been down since the first day of the strike, resumed operations Tuesday morning.

Meanwhile the steel plants in and near Pittsburgh which strikers failed to close continue to make steady gains both in the number of men at work and in their plant operations. One of the blast furnaces at the Clairton, Pa., plant of the Carnegie Steel Co., went into blast last Saturday night, while an additional stack at the Edgar Thomson works of the company is going, bringing the number of active furnaces to six. Of the 11 stacks at this works two are down for relining and another furnace is expected to be operating before the end of the week.

Agitators Making No Headway

Organizers are making no headway at the Homestead plant of the Carnegie company or at the south side works of the Jones & Laughlin Steel Co. At Rankin and Braddock the American Steel & Wire Co., has its plants operating, making rods and drawing wire. The Pittsburgh district plants of the National Tube Co., at no time much disturbed by the strike, are running even fuller than they were a week ago.

At no plant in the entire district has there been a loss. On the contrary, gains have been general and while labor leaders still are making extravagant claims as to the number of men out, their estimates are stated to be for the organization and the strikers and not for publication.

Outside the Pittsburgh district proper reports generally are favorable. The Cambria Steel Co.'s plant at Johnstown, Pa., still is shut down with no effort being made by the management to resume. Apparently none will be made until the strikers ask for a resumption. Reports from the Shenango valley are to the effect that operating forces are increasing. On the whole, western Pennsylvania has proven too impregnable for the strike organizers.

Considerable uneasiness exists in coal trade circles over the possibility of a strike in the bituminous fields in which the operators have an agreement with the United Mine Workers of America. It seems that little progress has been made, according to reports reaching here, at the conference now in progress in Buffalo between the operators and representatives of the miners in getting the latter to modify their demands, framed at the annual convention of the United Mine Workers at Cleveland last month.

The operators rejected the demands of the miners at Buffalo, on the ground that the agreement entered into in 1917 does not expire on Nov. 1, as claimed by the miners and also because the operators consider the demands of the miners in regard to wages and working hours grossly extravagant. Acceptance of the new wage and working scale, the operators say would add $1,000,000,000, a year to the coal bill of the American people; would cut down the actual working time of the miners to not more than 25 hours a week and

would reduce the production of the country to one-half present volume.

Danger of a tieup of the mines on Nov. 1, operators here say, is more serious than is generally supposed, for as the miners already have voted for a strike in the event that their demands are refused, and since the result of the Buffalo conference must be submitted to them for approval it is thought probable they will affirm the action of their convention. Only through a marked modification of the demands of the miners can the strike be avoided, the operators say.

On Tuesday the American Sheet & Tin Plate Co.'s sheet mill operations were increased to 80 per cent, and the Dover, New Philadelphia, old Meadows, Scottdale, Wellsville and Wood plants were operating 100 per cent. At Gary eight mills were active, at Guernsey six, at Hyde Park four, at Leechburg eight, Mercer seven, and Vandergrift 30. Tin plate production had been raised to 50 per cent. The Cambridge, Chester and Sabraton plants were running fully. At the Farrell plant 21 mills were running, at Gary four double mills, at New Castle 19, at Pittsburgh two, at Pennsylvania one, and at Shenango 38 out of 40.

Martial Law in Chicago District; Men Return

Chicago, Oct. 7.—Four thousand United States troops under Gen. eral Leonard Wood are at Gary, Ind., following the action of 500 discharged soldiers Monday night in donning army uniforms and joining strike pickets. More men returned to the mills when afforded protection. The Inland Steel Co.'s plant at Indiana Harbor is resuming operations with 4000 men. Martial law has been declared at East Chicago and Indiana Harbor. This is regarded as the breaking point of the strike.

A riot devoid of shooting took place in Gary Sunday and resulted in the Indiana militia being put on guard throughout the city to keep order and prevent unlawful gatherings. Previously the governor had been asked to send militia to Indiana Harbor and East Chicago and 11 companies were sent, four afterward being ordered to Gary from these places.

Monday morning almost the entire crew of the rail mill at the South Chicago plant of the Illinois Steel Co., reported for work and the mill was started after two weeks' idleness. At other mills of the United States Steel Corp., the situation is not markedly changed.

With troops in charge of the situation it is expected the men will return in large numbers, as intimidation will be ended.

Youngstown Plants Are Preparing to Start

Youngstown, O., Oct. 7.—No attempt has been made to operate plants here since the strike began, although indications are that efforts in this direction will be made soon. According to reports, several open-hearth furnaces at the steel plant of the Sharon Steel Hoop Co., Lowellville, O., will be charged probably this week. The number of workmen entering the Youngstown Sheet & Tube Co.'s plant at East Youngstown, according to authentic reports, shows a slight gain today. Approximately 700 men are at work in this plant as against 15,000 normally. Out of 6000 men employed by the Carnegie Steel Co. here, 1100 are reported at work. No disorder has taken place in the valley. Demurrage charges on all railroad cars in mill yards are extremely large. These charges at one plant average approximately $7000 per day. Further incoming shipments of materials have been stopped wherever possible. Rumors to the effect that the Republic Iron & Steel Co.'s bar mills at Moline, Ill., are closed down are denied by the officials of that company. The mills are rolling at 100 per cent capacity.

Mill operations in the Shenango valley are much better than in the Mahoning valley. At Sharon, Pa., several hundred men reported for work today, according to the officials of the Carnegie Steel Co. At the works of the American Sheet & Tin Plate Co., Farrell, Pa., 18 hot mills and 16 tin pots are said to be in operation. The National Malleable Castings Co., reopened its open-hearth and electric furnace departments Monday. The 14-inch mill of the Sharon Steel Hoop Co., is rolling at capacity. At New Castle, Pa., the steel works of the Carnegie Steel Co. and the tin mills of the American Sheet & Tin Plate Co., are maintaining 100 per cent output. The No. 1 furnace of the Carnegie Steel Co., which has been banked since the strike began, has been put in blast.

Operations Extended in Buffalo District

Buffalo, Oct. 7.—Conditions in the steel strike situation in this district indicate that the strike may soon be broken. Although the smaller two of the three plants which were tied up by the strike Sept. 22 are still idle, the Lackawanna Steel Co., the largest plant affected, is beginning to resume operations. One blast furnace was lighted Monday and preparations are being made today to light another. Between 200 and 300 steelworkers have deserted the strike cause and returned to work, and about 500 to 600 laborers and plant helpers have been working at the company's plant for the past week. It is expected that by the end of the week the Lackawanna plant will have still more units in operation.

No attempts have been made by the Donner Steel Co. to operate its Buffalo furnaces and mills, or by the Rogers, Brown Iron Co. to man its furnaces. Work at the Wickwire Steel Co.'s plant or the Donner Steel Co.'s Tonawanda furnaces has not been interfered with to any great extent. It has been necessary to replace men here and there, but no concerted walkout has occurred. The same applies also to the Buffalo Union furnace, where every blast furnace is working 100 per cent. The Lackawanna company has utilized some of its spare time to make needed repairs to blast. bessemer and open-hearth furnaces. Early Wednesday there was serious rioting, when a mob of 1200 attempted to hold up three street carloads of workmen going to the Lackawanna plant from Buffalo, but the riot was broken up by city police and state troops.

Ask for Re-Employment in Cleveland District

Cleveland, Oct. 7.—General conditions in the steel strike situation in the Cleveland district have not changed much during the past week. Production of pig iron is at a standstill, and the strike fever appears to have spread slightly to consumers' shops. The employers, however, still regard the situation optimistically, and state that many men are asking for re-employment.

The H-P nail works of the American Steel & Wire Co., the onlyl subsidiary in this district of the Steel corporation, which started operations last week, after being closed a week, is working at about one-third of its capacity, and more men are applying for employment daily. At the plant of the Lake Erie Bolt & Nut Co., which has been closed since Sept. 22, a small number of the men have returned to work. Other plants in the district make favorable reports, stating that practically all of the American employes are desirous of returning.

Last week 700 employes at the plant of the National Screw & Tack Co., went out, but on Monday 100

applied for re-employment, and the number is expected to increase.

A strike was declared at the two plants of the Cleveland Hardware Co. Two hundred drop forge operators walked out, and so crippled the plants that 1300 other employes were forced into idleness. The situation was somewhat improved Tuesday, the second day of the strike, when a large number of the strikers applied for re-employment.

According to officials of the Cleveland Hardware Co., and the National Screw & Tack Co., scarcely a single American joined in the strike. Steel strike organizers in this district deny the strike at these plants is connected with the general steel strike, but plant officials feel that it is part of it.

Little headway has been made by union organizers toward crippling the plant of the National Tube Co., at Lorain, O. Of the 10,000 employes only a few are out.

No Workers Are Out in St. Louis District

St. Louis, Oct. 4.—The second week of the strike failed in any notable manner to affect conditions in this district. Aside from a slowing down of deliveries of pig iron and other products from the North and East, nothing has occurred to interrupt the even tenor of the situation. Activities at foundries are intensive, and all steel plants in operation prior to the strike order are working as usual. Southern furnaces are supplying all the pig iron needed, but should the strike continue two weeks longer certain basic users here may find it difficult to obtain tonnages to keep running. Not a single worker in any steel or iron plant in the district has quit his job because of the strike.

Report Bethlehem Plants Operating at Normal

Philadelphia, Oct. 7.—The strike situation in the East improved further during the past week. At Coatesville mills are operating the same as before the strike or better due to increased demand. Union leaders are reported to have advised the men who are still out to look for other jobs. The men number only a few hundred. The Bethlehem Steel Co.'s plants are reported operating at normal, and the company's spokesman says: "We are operating so close to capacity that there is nothing to talk about."

Strike leaders, while admitting their early estimates of the number of men out are too large to cover the present situation, still are working hard to close down the Bethlehem's plants, and each day are making claims about what they expect to do the next. The Alan Wood Iron & Steel Co., has had a little difficulty with a small number of men, but operations have not been affected. The situation in East is satisfactory.

Railroad men employed by the Bethlehem Steel Co. Tuesday night voted unanimously not to strike. Strike leaders had great hopes of getting out the yard crews.

Conditions Are Normal in New England

Boston, Oct. 6.—Steel plants in New England report a continuance of normal operations. The fact that plants in other parts of the country are shut down was expected to lead to an increase in the business of the local concerns, but this has not been the case. Deliveries of raw material have slowed down to some extent but this is not affecting operations at present. Labor conditions throughout New England have not been affected by the steel strike. Small strikes continue to break out in some industrial centers but there are fewer men on strike now among machine manufacturers and foundries than at any time in many months. At Fitchburg and Worcester the striking molders have returned to work after several weeks of idleness, without receiving concession from the foundries. Warehousemen report a rush of orders during the last few days and this is attributed to the tie-up of steel mills. Steel plant representatives, however, say that all orders for spot shipment are being entered and that deliveries are being made.

Alabama Strikers Leave Union; Go to Work

Birmingham, Ala., Oct. 7.—There is absolutely no indication here that a strike is on in the Birmingham district, and all plants of the Tennessee Coal, Iron & Railroad Co. and the American Steel & Wire Co. are in full operation. Many men who were reinstated tore up their union membership cards.

The strike was one of the greatest fizzles organized labor ever staged in this district. Production is not only normal but in some instances records are being broken. Reports are current that the loyalty of employes of the Tennessee Coal, Iron & Railroad Co. and the American Steel & Wire Co. will be recognized and some developments of special interest to labor are expected soon.

Labor Conference

Now in Session May Discuss Principles in Steel Strike

Washington, Oct. 7.—If the steel strike is to receive attention of the national industrial conference which began Monday, developments so far do not indicate it. The first two days of the conference were devoted to organization work. Secretary Lane was made permanent chairman. So far no business has been before the conference, which is expected to get under way Wednesday.

Indications are that the conference will last two or three weeks, and perhaps longer. It has been reported that labor delegates may raise the steel strike question, but it is not known whether this will be directly or indirectly through principles labor claims are involved in the strike. The public group, of which E. H. Gary is a member, may raise the question of principles, or this may come from the employers' group.

Reorganize Company

Announcement is made of the reorganization of the Cromwell Steel Co., Lorain, O., with leading New York and Cleveland steel interests, who will assume their duties Oct. 15. Veryl Preston, formerly president of the Eastern Steel Co., Pottsville, Pa., is to be president; George H. Baumont of Pickands, Mather & Co., Cleveland, first vice president; H. A. Raymond of the Cleveland-Cliffs Iron Co., Cleveland, second vice president; Harold F. Clark of the law firm of Squire, Sanders & Dempsey, Cleveland, secretary, and George P. Steele of the First National bank, Cleveland, treasurer. J. C. Cromwell, who organized the company some time ago and who is leading shareholder, surrenders his 99-year option on the plant and remains as a director of the company.

To Erect Body Plant

Plans for the erection of a great automobile body plant in Cleveland by the Fisher Body Corp., Detroit, were announced Tuesday. Brief reference was made to this undertaking on page 662 of the Sept. 4 issue of THE IRON TRADE REVIEW, although details at that time were not available. In his announcement, President Frederick J. Fisher, of the Fisher Body Corp., states: "The plant will be the largest, most modern single complete up-to-date manufacturing unit of its kind in the world, employing about 7000 operatives, whose annual payroll will aggregate $10,000,000."

Belgian Plants in Hard Struggle

Cockerill and Ougree-Marihaye Furnaces and Mills at Liege and Seraing Handicapped by Insufficient Equipment and Lack of Coal and Coke — Thousands of Tons of Material and Machinery Stolen — Works are Still in Ruins

BY FRANCIS MILTOUN
Paris Correspondent of The Iron Trade Review

GOING back up the trail of the German invasion of Belgium, from Antwerp and Brussels to the valley of the Meuse, in a Belgian government staff car recently, I inspected the industrial districts damaged in the first few weeks of the war.

The opinion is general that Belgium by no means suffered to the extent of France, but I think the point of view is wrong. The devastation of the mining town of Lens in northern France, now a mere heap of stones some square miles in area, is no greater in its effect than that of the Cockerill or Ougree-Marihaye plants of Liege and Seraing.

In that beautiful valley through which we rode on one of the finest roadways of Europe, 50 miles from the citadel of Namur to the wooded heights above Liege, the most "Latin" city of Belgium, there was not a kilometer but what bore the battle scars of war. The history of the massacres of Andenne, Huy, Verviers and Vise will not be forgotten. The victims were the men, women and children who made up the laboring population of this section of industrial Belgium. Eight months after the armistice scarcely a wheel was turning in all that battery of great plants suggested by the names of Cockerill, Ougree, Angeleur or Esperance-Longdoz, scarce a tongue of flame or a feather of smoke was seen in the air.

I had been furnished the following general facts by Monsieur Ledouble, the civil engineer of the district, before leaving Brussels, so that when I actually trod the still smoky ruins of the great plants my observation was merely one of corroboration. By talking with Monsieur Armand Desoer, the director of Ougree-Marihaye, I got a good impression of what really happened and what is happening. Incidentally, Monsieur Desoer was in captivity in Germany during the war. He did not mind telling me this, or of some of the incidents of his sufferings during the period.

In general, the situation in this intensively industrial district resulting from the war is as follows: The extraction of coal is still on a limited basis, as it had been kept by the Germans during the period of their occupation. The coke ovens of the Cockerill plant have been shut down since

Tracing the Revival of Belgian Industry

THIS is the third article of a series on the iron and steel industry of Belgium written by Francis Miltoun, Paris correspondent of The Iron Trade Review. *Mr. Miltoun visited the plants and interviewed the officials of the companies concerning which he is now writing, so that his articles are authoritative as well as timely. The damage done by the Germans to the Cockerill and Ougree-Marihaye plants at Liege and Seraing, two of the greatest iron and steel establishments in Belgium, is described in this article. The extent to which the two companies have succeeded in overcoming obstacles and getting their plants in operation also is set forth in detail. Their efforts in this direction are no less interesting and important to Americans than the story of how Germany sought to exterminate them. The initial article of this series appeared in* The Iron Trade Review *Aug. 14, while the second appeared Sept. 25.*

ELECTRICAL POWER HOUSE OF THE OUGREE-MARIHAYE CO., NEAR LIEGE. DYNAMOS IN THIS PLANT WERE STOLEN BY THE GERMANS

THE FOUR UPPER PHOTOGRAPHS SHOW THE INTERIOR OF ROLLING MILLS OF THE OLGREE-MARIHAVE CO. BEFORE AND AFTER THE WAR. THE TWO LOWER PHOTOGRAPHS SHOW THE PROGRESS OF DESTRUCTION IN THE COMPANY'S STEEL PLANT. COMPARISON REVEALS HOW THE GERMANS SYSTEMATICALLY REMOVED EVERYTHING OF WORTH

June, 1917. Ougree has two batteries of 60 ovens, one of which was in operation before the war and the other was built during the occupation. The two are virtually intact except that all the piping, charging equipment and recuperating appliances were stolen or destroyed during the few months just before the armistice.

The Cockerill blast furnaces were practically destroyed, only two out of the former seven being in condition susceptible of immediate repair. One of the Ougree company's two groups of four furnaces suffered complete demolition, while the second, although their foundations are intact, were stripped of their accessories. All were practically out of business at the time of the armistice, and but two are in process of reconstruction, so as to meet the need when a sufficient supply of ore can be brought from the company's mines in France. The central electrical station of the company, with a capacity of 1500 horsepower, was entirely destroyed and its canalizations and cables were all stripped and carried off.

The Cockerill steel plants continued to remain in partial operation up to the end of 1918, but not more than a single Martin furnace is expected to be in operation for some months. At Ougree four Martin furnaces were utilized by the Germans and these are practically intact, one producing, with a capacity of 40 tons a day. Three others are awaiting the necessary material and equipment for rebuilding. Rolling and wire mills were kept in operation to some extent by the invaders, and the one rolling mill now in operation is working up the product of the Martin furnace.

A curious observation was made by Monsieur Desoer to the effect that a Morgan wire mill was the only piece of machinery actually in working condition when the company regained possession of its plant. At the same time American companies were laying down, on the quays of Antwerp, a product similar to that which the Cockerill plant was capable of turning out, but at a price lower than at which the Cockerill company could produce it. And yet labor of all kinds is supposed to be 25 per cent lower here than elsewhere in the industrial world. The incident demonstrates America's supremacy in iron and steel.

The Esperance-Longdoz plant at Seraing is in a similar state. The Monceau rolling mills at Tilff remained in operation under their owners' direction until November, 1918, when the Germans brought their own workmen and proceeded with the demolition of the equipment.

The Colonster works at Embourg has but one rolling mill, and nothing much remains but its foundations. It foresees no immediate prospect of getting into production. The Ourthe rolling mills at Embourg worked intermittently for German account until some time after the latter part of 1918 when it stopped completely.

The Defflandre works at Embourg have not turned a wheel since 1918 in the fashioning of the iron and steel which it drew from the big plants of the neighborhood. La Rochette at Chaudfontaine has been inactive since 1917; not a roll has turned in its mills, not a hammer has fallen in its forges. Everything was either demolished or "lifted" by the Germans. The Nagelmackers plant at Vauxsous-Chevremont is completely destroyed. Asnay at Chenee was shut down in 1914, and its rolling mill equipment, boilers and machine tools were all demolished. Two small blast furnaces only remain as being possible of building up anew.

The zinc industry was largely in the hands of the Prayon Metallurgical society at Trooz. Eight hundred workmen were employed before the war. Work continued until November, 1916, when work ceased from a lack of ore. The German authorities "lifted" all its rails, castings, molds and gas generators, three-fourths of all its electrical equipment, its freight cars and its locomotives.

Furnaces Entirely Destroyed

The Biache Saint Vaast zinc foundry and rolling mills at Ougree worked only until September, 1916, and but a score of workmen are now engaged in clearing up the crumbled walls and battered material left by the Germans. The furnaces were entirely destroyed, and also all nonferrous metals, which might otherwise have served the German war establishment. A supreme effort has enabled the company to make plans for immediate resumption, and one furnace at least will soon be in operation. All other rolling mills and smaller establishments engaged in the shaping and fashioning of sheets and articles of zinc are out of business as a result of the damages of war.

Monsieur Desoer says this is what the Germans "lifted" or destroyed at the Ougree-Marihaye plant:

	Tons
Raw material	39,734
Finished products ready for shipping	13,244
Copper, bronze and belting	310
Machine tools and various tools broken up on the spot and shipped away as scrap	48,324
Machines, boilers, motors, rolling stock, cranes, shipped to Germany	4,119
Total	105,731

The list of plants and equipments damaged or destroyed is as follows:

Four blast furnaces and accessories completely destroyed.

Four blast furnaces seriously damaged.

One mixer "lifted," and one destroyed.

One Thomas furnace of six retorts, of which there remain two retorts, greatly damaged.

One machine for the crushing of slag of which seven crushers and five tubes and accessory boilers and power plants were completely destroyed.

Twelve rolling mills with boilers, power plants, shearers, etc.

Various machine shops completely robbed of their equipment. More than 40 machines used for the production and finishing of rails and plates destroyed.

Repair shops for the plant equipment destroyed; in all 110 machines in this category alone.

Eighteen turn tables.

Eighteen electric cranes.

Two steam cranes.

One hundred and seventy-eight motors of 4550 horsepower.

Eighteen gas motors of 9400 horsepower.

Nineteen thousand square meters of hangars and shops.

Three locomotives.

Forty freight cars.

According to 1914 prices the damage is estimated at 40,000,000 francs.

At the time of my visit one blooming mill was being put into operation. A Martin furnace was put into operation in January, 1919, and a Thomas furnace was all ready for firing. A train of 500 plate and rail rollers was in operation at a reduced rate of production and it was hoped to put two others in operation within a month. Two blast furnaces were in operation, another planned for operation in October, 1919, and a fourth in January, 1920. A battery of coke furnaces had been put into condition for operation in August. It is planned to operate a second battery in February.

A general meeting of the Ougree-Marihaye company was held the latter part of July and the following balance sheet was made public. Losses of the period of the war were set forth as follows:

	Francs
1914-15	2,690,970
1915-16	2,449,752
1916-17	2,593,611
1917-18	3,047,082
1918-19	4,133,614

The company gave its personnel as part payment of damages they may have received, and in recognition of its obligations toward its workers, the sum of 9,213,002 francs, in cash or in kind. The director general, Monsieur Trasenster, will shortly abandon his post, though remaining on the governing board as an administrator. Monsieur Trasenster was chiefly responsible for the organizing of the great

CONVERTER AT THE PLANT OF THE OUGREE-MARIHAYE CO., DESTROYED BY THE GERMANS

300,000,000-franc Belgian iron and steel combination of which I recently gave particulars in THE IRON TRADE REVIEW.

The Ougree-Marihaye establishment as a result of its last meeting has made arrangements to acquire a part of the celebrated Saintignon mining properties in the Longwy basin of France, these being contiguous to one of Ougree's subsidiary company's at Chiers. In payment for these rights the Saintignon interests are to receive 5,000,000 francs in cash, and 10,000 shares of the capital of the Ougree-Marihaye establishment. The Dugree-Marihaye company also possesses its own coal mines, production in which in the season of 1918-19 reached 55 per cent of normal and which is today at 70 per cent. All further development is dependent on labor and wages.

Powdered Coal As Fuel For Annealing

IN the malleable iron foundry there are two processes which require for their fulfillment the generation of a large quantity of heat. These are the melting of the pig iron and scrap and the annealing of the castings. The furnace efficiency in both cases is low, and there is thus afforded an opportunity to effect a considerable reduction in the fuel consumption.

Approximately 15 to 20 malleable foundries are burning powdered coal in annealing furnaces with satisfactory results. This fuel was first applied at the plant of the Erie Malleable Co., Erie, Pa. The credit for the success of this installation belongs to B. J. Walker, who in 1896 operated annealing furnaces in which the source of heat was powdered coal. Other companies whose installations closely followed that of the Erie Malleable Co. were the International Harvester Co. and the Symington company. A recent installation is that at the Pressed Steel Car Co., formerly the Pennsylvania Malleable Co.

This company made its initial applications of powdered coal to annealing furnaces in the fall of 1917, and since then these furnaces have been in continuous operation. In this plant the furnace is practically all below floor level with the roof formed by bungs. There are 10 large and 18 small furnaces, some of which are used for annealing steel castings. The larger ones have a capacity of 50 tons, while the smaller hold 25 tons. The requisites in an annealing furnace from a thermal standpoint are a uniform temperature (and consequently heat) throughout the heating chamber and the maintenance of a constant degree of heat for the proper length of time. To secure these conditions, it was necessary to install four burners in each furnace and maintain a steady flow of coal to these burners. A pyrometer is inserted in each end of each furnace. Each one is connected to a central recording instrument. It is the duty of the furnace attendant to read the temperature of each furnace at frequent intervals on this instrument, so that there is little chance for any wide fluctuation in temperature. One attendant supervises all the furnaces.

With powdered coal it requires from 14 to 18 hours to bring the furnace to 1600 degrees, with fuel oil the time is 22 to 24 hours, and with natural gas about 26 hours. From the foregoing it seems apparent that powdered coal gives results which are thermally satisfactory. There is an accumulation of fine ash which must be removed from these furnaces at intervals. The length of these intervals will depend on the percentage

---

Abstract of a paper presented at the annual meeting of the American Foundrymen's association, Philadelphia, Sept. 29-Oct. 3. The author, Charles Longenecker, is associated with the Bonnot Co., Pittsburgh.

of ash in the coal. When the coal has a low ash content the accumulation is removed once a month. In the standard type of furnace, where the heating chamber floor level is at general floor level, the disposal of the ash is of small moment, due to greater accessibility of both heating chamber and flues.

In annealing malleable castings a fluctuating temperature must be avoided and at no time is it permissible to allow the temperature to fall below the critical range. To secure this control of the heat requires close regulation of both the fuel and the air to burn it. No trouble has been encountered in holding these conditions constant.

In another malleable iron foundry where powdered coal is now burned in the annealing furnaces, a saving of 48 per cent has been effected in the quantity of fuel consumed. In this case the amount of powdered coal burned per ton of output is 450 pounds. The time to bring the furnace to temperature has been reduced from 24 to 36 hours required for hand firing, to 11 to 14 hours. When hand fired, there was always a difference in temperature in these furnaces of from 200 to 300 degrees between the front and rear. Today, when fired with powdered coal, this temperature is uniform. This is accounted for by the fact that the pressure in the furnace is equalized as it is impossible to obtain a uniform temperature throughout the chamber unless the furnace is under a slight pressure. With stack draft and hand firing it is exceedingly difficult to avoid pulling in some cold air, especially at the door. This makes a cold streak and naturally it is impossible to secure a uniform temperature under such conditions.

The advantages of powdered coal for annealing may be summarized as follows: First, a reduction in fuel cost is obtained in comparison with other fuels; second, it is easy to control the feed of coal which corresponds in this respect to gas or oil; third, there is a considerable saving in labor over hand-fired furnaces; and fourth, the supply of coal is more abundant than oil or natural gas.

Besides malleable castings, the Pressed Steel Car Co. also manufactures steel castings. They are annealed in the same furnace as the malleable castings. The temperature carried when annealing steel is 1660 degrees Fahr. One of these furnaces was lighted at 3 p. m., July 15, and firing discontinued at 11 a. m., July 16, so that the total time required for the annealing was 20 hours. The coal consumption was 140 pounds per hour.

The coal and air are delivered to the burners through pipes. A large spiral-riveted pipe on top carries the coal, while the secondary air flows through a pipe placed at a lower level. From both these branch 2-inch wrought-iron pipes. The latter are connected at their upper ends to the control valves which regulate the flow of coal and air to the burners. Their lower ends terminate at the burner.

Principle of Distribution

The coal which passes through the upper pipe is fine, as it must be held in suspension throughout the length of the pipe. The principle of distribution is as follows: The coal is received in cars and after being dried is pulverized and then conveyed pneumatically to a substation at the foundry building. Here it is separated from the high-pressure air and falls into a 25-ton bin. Two spiral screws feed the coal from this bin into a pipe connected to the suction side of fan. This fan has a capacity of 6000 cubic feet of air per minute. In the fan the fine coal is mixed with air in the proportion of 1 pound of coal to 60 cubic feet of air. This mixture is then forced through the pipes and delivered to the burners as desired by the furnace attendant. As is well known, it requires at least 200 cubic feet of air to form a combustible mixture with one pound of coal.

There is, therefore, no danger of combustion until the necessary additional 140 cubic feet has been added at the burner. The ratio of 1 pound of coal to 60 cubic feet of air is maintained automatically by a simple electrical contrivance. If desired, the ratio can be changed and the machinery set to hold it constant.

Chrome Output Decreases

Reports to the United States geological survey show that chrome mining in this country has practically ceased. Figures compiled by the survey for the first six months of 1919, show that from Jan. 1 to July 1, but 1400 tons of chrome ore was mined and shipped from three mines. In addition about 300 tons mined in 1918 was marketed during that period.

These statistics show a remarkable contrast to those which prevailed during 1918, when there were nearly 600 active owners of chrome properties and the total amount of chrome ore shipped was 82,350 tons of all grades.

The imports of chrome ore during the first half of 1919 amounted to 19,658 tons ,about half of which came from Oceania.

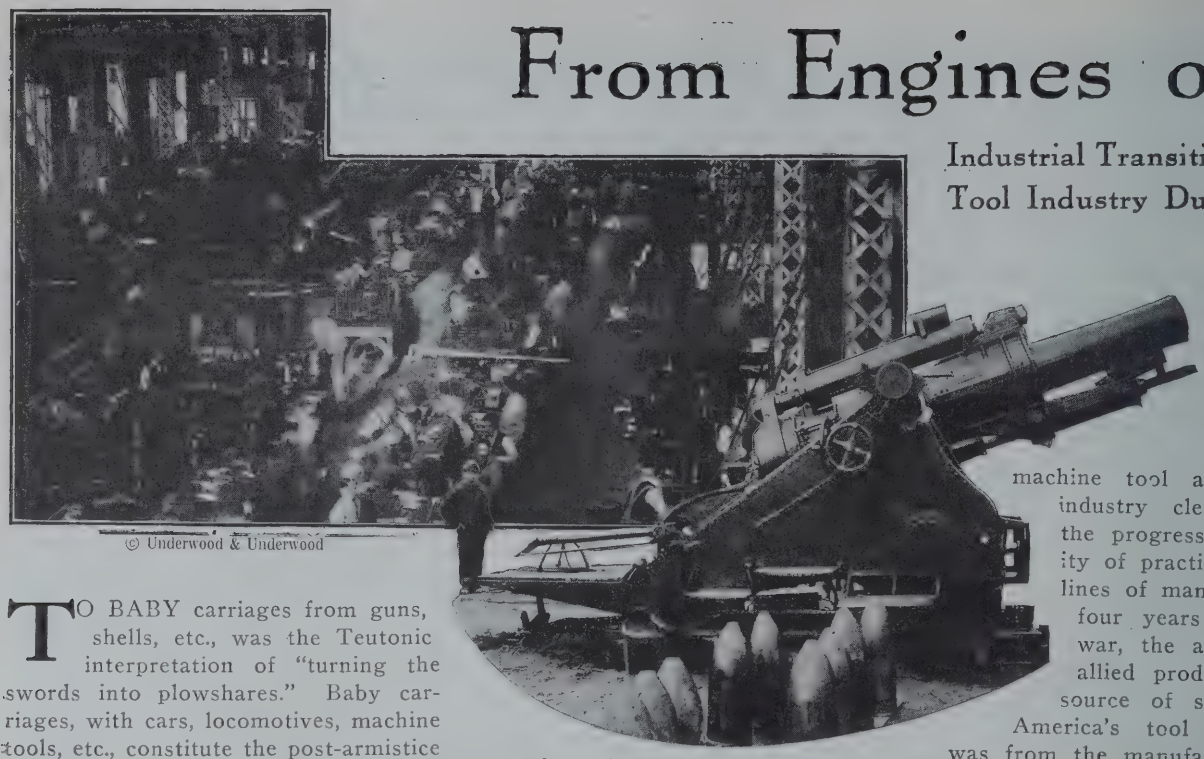
According to a bulletin issued by the survey, the decline in the domestic production is general and overwhelming, sparing only localities favored by cheapness of transportation, high grade of ore, or cheapness of production. It is evident, from the figures for the first six months, that the demand for chrome ore required for consumption in the United States is supplied by imports.

Westinghouse Observes Anniversary

A jubilee dinner at the William Penn hotel, Pittsburgh, attended by more than 871 veteran employes of the Westinghouse Air Brake Co., Wilmerding, Pa., and its subsidiary companies, was held Saturday, Sept. 27, to observe the fiftieth anniversary of the organization of the company. At the same time that the Westinghouse Air Brake Co. employes were celebrating in this country, their fellow workers in Europe, were also commemorating the occasion at London, Paris and Turin, by a jubilee dinner.

Thomas Kerr, general patent solicitor for the company, at the Pittsburgh celebration spoke on "The Fundamental Patent, No. 88929." A coincidence, is that the speaker, on April 13, 1860, then an office boy in the employ of a Pittsburgh patent attorney, witnessed by his signature the application of George Westinghouse for the first patent rights on the original Westinghouse airbrake.

Metals are Recovered



During the war the production of tin in sufficient quantities to supply the demands was a problem which faced all belligerent governments. Consequently conservation of this metal was urged. According to a bulletin recently issued by the United States geological survey, during 1918 there were 7142 tons of tin recovered as pig tin and 16,695 tons of tin recovered in alloys and chemical compounds, totaling 23,837 tons.

Conservation of other nonferrous metals was urged and statistics show that during 1918, the total copper produced from secondary sources was 352,670 tons. The recovery of zinc was 120,590 tons, while 97,100 tons of secondary lead, 15,050 tons of aluminum and 5226 tons of antimony were recovered.

A new form of hardware price list of double pointed tacks and staples has been adopted by the American Staple Manufacturers' association, with headquarters at 120 Broadway, New York. The list is made up of net differentials which are to be added to the base price, the latter being quoted by individual manufacturers.

From Engines of War

Industrial Transition Period Prove Tool Industry Due to Tremendo

© Underwood & Underwood

TO BABY carriages from guns, shells, etc., was the Teutonic interpretation of "turning the swords into plowshares." Baby carriages, with cars, locomotives, machine tools, etc., constitute the post-armistice output of the great Krupp works, Essen, Germany, which was once the powerful arsenal of German militarism. This change, has effected a sharp shrinkage of profits and the manufacture of these essentially peace products have proved far less profitable than the forging of weapons for the kaiser's cohorts.

Transition from a war to a peacetime basis has been less disastrous for other nations, particularly the United States. In England, France and America, the automotive and allied industries have prospered and are prospering in their after-war business as they did on war work during the hostilities.

In England, the manufacture of automobiles is being taken up on a scale never imagined possible prior to the war. Makers are going in for quantity production, having absorbed many ideas of American practice. This effort aims to utilize increased plant capacity brought about by the war. The Austin Motor Co., Ltd., London, made shells, forgings and fuse parts in addition to armored cars during the war. It is endeavoring to produce this year, 30,000 automobiles which are selling around $2400. This is a comparatively large output for an English plant. Cubitts, Ltd., London, which before the war, erected steel and concrete buildings and during the conflict, produced great quantities of fuses, before hostilities ceased decided to take up the extensive manufacture of automobiles. It sold much of its war equipment which could not be adapted and purchased a number of additional tools, presses for radiator production, etc. Many such cases could be noted but an exception to the rule is found in the activity of the steel manufacturers, Cammell, Laird & Co., Ltd., Sheffield, which purchased the British ordnance factory at Nottingham. This company is adapting it to the manufacture of steel freight and passenger cars.

Practically the same condition applies in France. There, the automobile is gaining a new lease on life. The 1919 production is expected to exceed 100,000 cars, which is large for France. Berliet is making a car which sells for $2500 as a substitute for his war work, while Louis Renault, Paris, of tank manufacturing fame, is producing one which sells for $1500. Andre Citroen, who originated the herringbone gear and who made vast quantities of forgings, fuses and shells, averaging 50,000 of the latter daily, now is manufacturing a 4-cylinder car, selling at $1600. Schedule of production calls for 100 cars a day and to make this possible, it was necessary to add much equipment, including gear cutters, etc., to the Citroen plant.

If the automobile and allied industries abroad have come into their own since the war ended, this is true in increased measure in the United States.

Machine Tool Industry Barometric

The machine tool industry, while not basic is barometric. Itself dependent upon the great foundation industry of the world, iron and steel, virtually all other industrial activity depends upon it. As a barometer, the machine tool and equipment industry clearly indicates the progress and prosperity of practically all other lines of manufacture. For four years prior to the war, the automobile and allied products were the source of strength of America's tool industry. It was from the manufacture of automobiles, trucks, tractors, accessories and parts that the toolmakers drew the greater portion of their business. Demands made by these industries stimulated greatly the development of machine tool design. From 1914-15 onward, war work served as a profitable substitute and facilities of the machinery manufacturers were taxed to and beyond capacity. Tool-builders consecrated themselves and their plants to the winning of the war. Huge numbers of tools were produced at high speed at the call of the army and navy. This was particularly true after the United States entered the conflict. The versatility of the tool-builders as a class was demonstrated fully and they entered the reconstruction period following the signing of the armistice better fitted to meet industry's peaceful demands because of their war experience. The war had presented requirements which developed new ideas, improvements, amplifications, etc. Quantity production reached during the war has pointed the way for expanded efforts along that line in peace. The demand for tools today never was greater and the predominating portion of this is coming from the automobile industry. Thus the industry is reverting to a condition which obtained from 1910 to 1914.

Closely following the signing of the armistice much discussion and conjecture as to the vast number of machine tools, owned by the government and the effect upon the market, appeared in manufacturing circles. One report stated the government

to Instruments of Peace

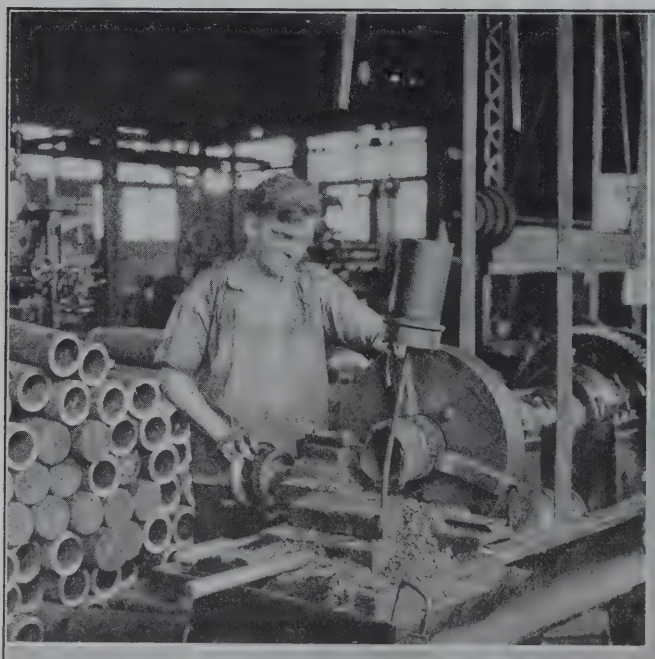
Comparatively Easy for Machine Spurt in Automotive Production

BY W. H. LLOYD

© Underwood & Underwood

owned in excess of $300,000,000 worth of tools. Great apprehension was expressed lest these should be thrown upon the market to the injury of the machine tool industry. How this $300,000,000 bill of machine tools has dwindled is one of the interesting stories of the reconstruction period. This estimate apparently was made by those uninformed regarding machine tool values. According to those who are in a better position to judge the facts, $100,000,000 much more closely would approximate the real figure. Furthermore many of these tools have been retained by the government for its arsenals. The latest expansion along this line occurred a few weeks ago when the large shell plant of the American Brake Shoe & Foundry Co., Erie, Pa., with a great layout of machine tools was purchased by the government for an arsenal. Earlier in the year the shellmaking equipment purchased for the Cribben & Sexton Co., Chicago, stove manufacturer, was taken into the Rock Island arsenal. The large number of tools used formerly on shell production by the Symington Machine Corp., Rochester, N. Y., also have been reserved for government establishments. Many other tools supplied by the government to war plants have been absorbed in this way. A large number of this government war equipment, also, has represented special tools which have been or eventually will be scrapped. A few weeks ago, a list of 1036 government-owned tools available as of Aug. 8, was inventoried at approximately $2,500,000.

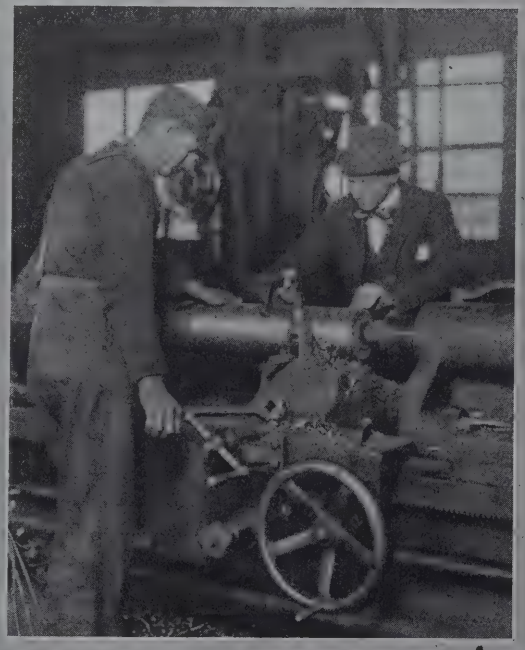
Many Tools Sold From War Plants



Nevertheless, large numbers of machine tools from war plants are being sold at private sale. In these transactions the used machinery dealer has figured prominently. During the war, the function of these dealers was limited, owing to the large demand for new tools, although when munition plants could not obtain new machines, their requirements were supplied with used machinery since speed was the prime requisite. Thousands of these second-hand machines have been sold and contrary to expectations have not proved an obstacle to the sale of new tools. On the contrary toolbuilders have welcomed these sales and the fact that the tools are finding places in industry. This is because in hundreds of cases the use of the old tools has created a desire for new. It has been found that a used machinery user is a prospective new machinery buyer. In fact deliveries today from toolbuilders' plants are deferred from 60 to 90 days and in some cases for even longer periods. Since a tool is considered second-hand when once it is put under belt, many practically new machines have gone to buyers who formerly remained consistently out of the used machinery market. In some cases machines sold as "second-hand" never have been uncrated and some attractive purchases have been made.

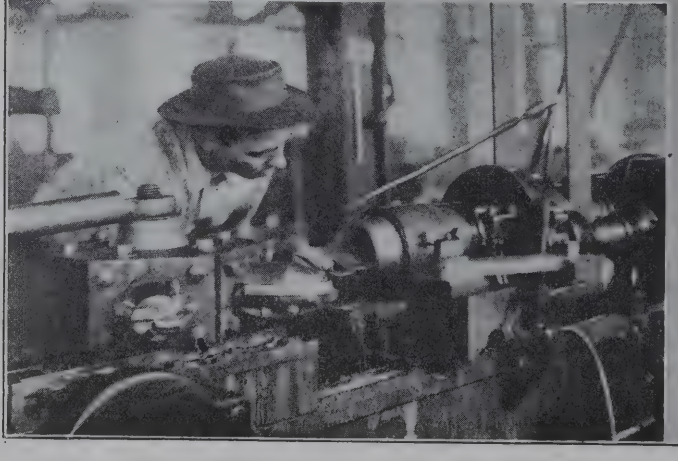
Increased shipbuilding has created an enlarged demand for punches and shears and that in turn has caused the punch and shear manufacturers to add to their machine tool equipment. Increased tire manufacturer also has created a larger demand for presses. All the tire companies of Akron have been large inquirers for tool room equipment during the last several weeks. From makers of stamped parts, there has come an enlarged market for presses. Stamping was developed as never before during the war. Now many automobile parts are stamped or drawn whereas before the war they were cast.

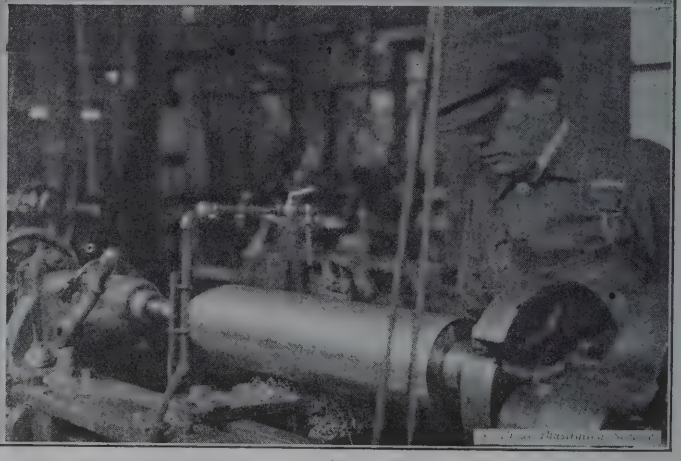
Automobile Manufacturers Expand



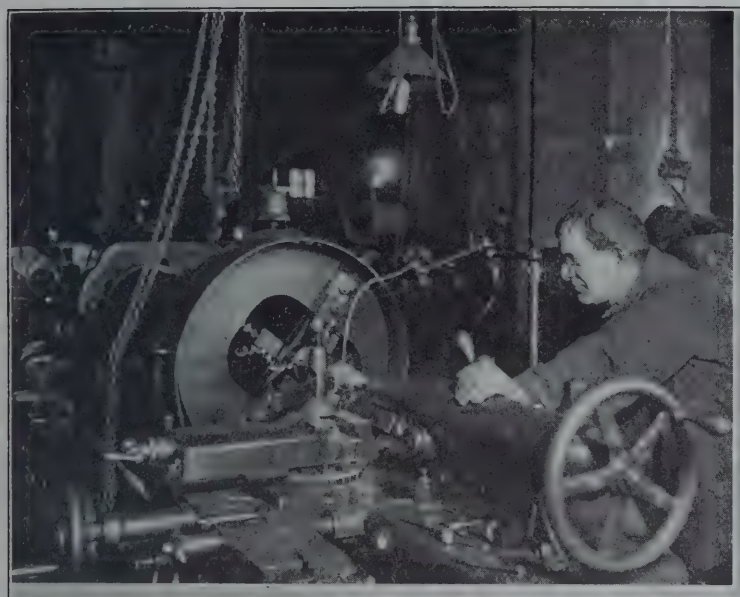
Whatever stimulated development in automobile production is going on abroad, it is meager compared to that under way in this country. The American automobile industry was first to respond to the peace conditions and the turnabout was comparatively easy. Practically every manufacturer of pleasure cars has had to build additions or new plants; several have commenced the manufacture of lighter lines. Among these are the Chandler Motor Car Co., Cleveland, the Hudson Motor Car Co., Detroit, and the Willys Corp., Toledo, O. The latter will manufacture its new car at the plant of the Duesenberg Motors Corp., Elizabeth, N. J. This plant was essentially a war works, since it produced gasoline motors for automobiles, tractors, ships and airplanes. This equipment is to be devoted to the new line of production. Recently the General Motors Corp., Detroit, increased its capital to $1,000,000,000 and expects to produce 500,000 cars annually. These are but a few of the leading new activities in the automobile world all of which denote increased machine tool business, both new and used. The result of the swift recovery and expansion of the automobile and affiliated lines of production has been a tremendous demand for machine shop equipment. Dealers throughout the country and especially those serving the great automobile producing centers of the Middle West have drawn the largest fraction of their business

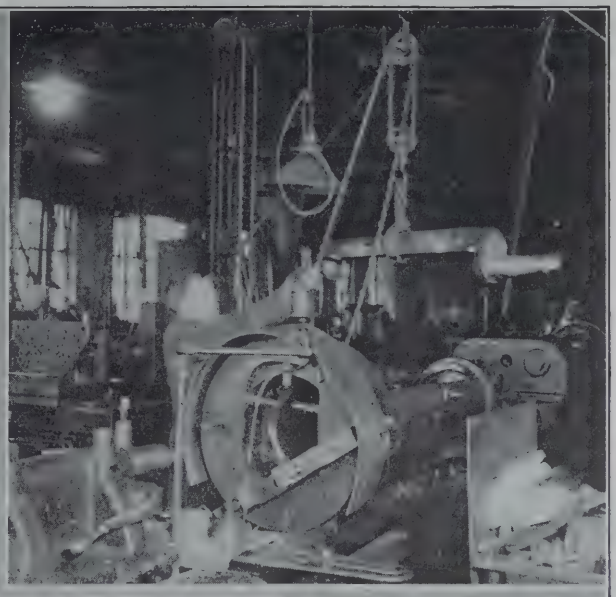
Many Shellmaking Tools Have Been



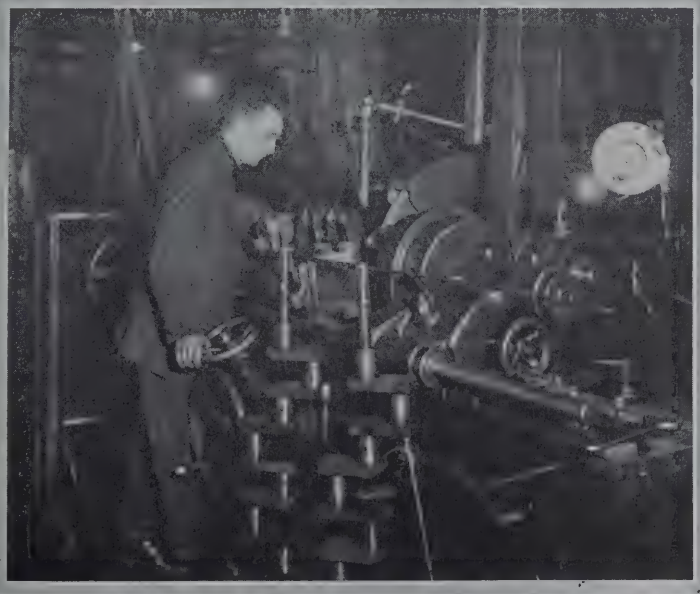


WITHOUT doubt much if not most of the shell and other munitions of war used by the allied nations in the late world conflict came from former automobile shops. While it is true that a great deal of the shellmaking equipment was special or of the single purpose type which cannot be adapted to the peace-time activity of those same automobile plants, it likewise is true that many of the machines have had and are having the special fixtures removed and others are being substituted which permit of their adaptation for machining automobile parts.

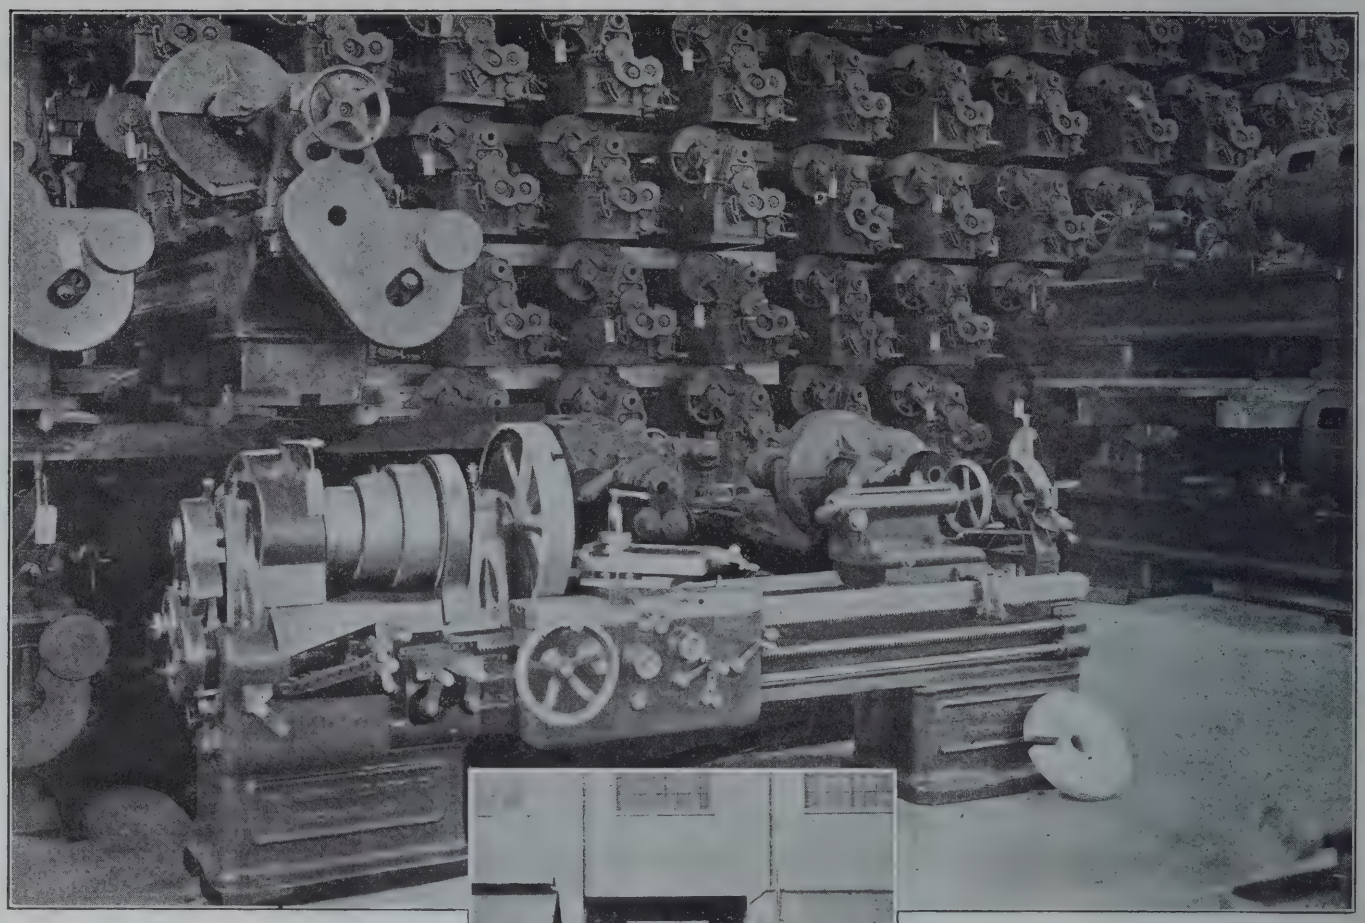




FIVE operations conducted on lathes are shown in the accompanying illustrations. At the right above, a cutting-off operation is shown, trimming off the rough end of the forging. At the right, the shell nose piece is being faced to fit the finished forging. In the center, the shell is being rough turned to general dimensions. The turret lathe operation shown in the lower left hand illustration is the boring of the shell's interior while finished turning is being done in the lower right hand picture. Shells must be as nearly perfect as possible to within 0.001 inch.



Rebuilt for Automotive Operations



AUTOMOBILE plants were the first of all to answer the call to peace work. Because they had for the most part become well equipped for war production, they were able quickly to turn their attention to the long pent-up demand for their regular products, pleasure cars. Even so, the turnover required in some known cases about twelve weeks.

IN THE top illustration at the left an automobile axle is being turned. At the right, it is being lifted from the lathe. Crankshafts are being ground on the Landis grinder in the center. Three automatic gear-cutting machines, as shown below at left, can be operated by one boy. Pistons after coming from the lathe, are shown below at the right.

TRAINLOAD OF FORMER WAR WORK LATHES OUTSIDE PLANT OF HILL, CLARKE & CO., CHICAGO. ABOVE, HOW THE LATHES TO BE REBUILT ARE PILED INSIDE THE PLANT

from these quarters as the names of their customers clearly show. Various industries have supplied their machine tool requirements from the large layout of the Dayton Metal Products Co. inventoried at about $2,000,000 which was used during the war for the making of detonators and airplane parts. Most of this equipment was marketed through a Cleveland dealer. The Burroughs Adding Machine Co., Detroit, bought approximately $10,000 worth of these machines. With this principal exception, the larger lots of this equipment went to the automotive industries.

Carload Sale is Made

One of the largest sales made out of this Dayton stock, through another Cleveland dealer, was a carload of assorted machinery to the Automobile Screw Products Co., Cleveland, essentially an automotive plant. This same dealer sold around $75,000 worth of machinery from the plant of the Toledo Screw Products Co., Toledo, O., which produced 1⅞-inch shell during the war, as well as a large number of machines from the time fuse and detonator plant of the American Multigraph Co., Cleveland. The Toledo Screw Products Co. has utilized as much as possible of its shell-making machinery in the manufacture of electric vacuum cleaners.

This dealer's experience duplicates that of others in that the automotive and allied industries have taken most of the used machinery it has offered for sale in recent months, much of which has come out of former war work plants.

Various lines of manufacture, classed as "nonessential" during the war which because of that reason were restricted on equipment purchases also have been important buyers. These requirements largely have been filled from used offerings. Among these are: The Electric Vacuum Cleaner Co. and the Cleveland Burial Case Co., Cleveland; the Advance Machinery Co., Van Wert, O.; and the Garford Mfg. Co., Elyria, O. An Albany dealer has been offering 5000 machine tools, 95 per cent of which are new, from the plants of the Colt Patent Firearms Mfg. Co., Hartford and Meriden, Conn. A New York house is acting as special agent in the disposition of about 1000 tools from the plants of the Savage Arms Corp. These include 250 lathes, 200 milling machines, 28 shapers and various other tools. Various dealers have disposed of the equipment of the Thurlow Steel Works, Chester, Pa., used formerly to machine shells for the United States government. A considerable quantity of all these lists of equipment was sold direct to users.

Eastern Firms Active Sellers

Several companies in Massachusetts which were active in war work have sold their equipment. The Standard Mfg. Co., Malden, Mass., however, has retained all of its war machinery and has added considerable new. It produced shoe and size stretchers for the army and its equipment could easily be adapted to its regular work. The Westfield Mfg. Co., Westfield, Mass., manufacturer of bicycles and motorcycles, made 75-milimeter shells during the war. Few of its machines were special single purpose tools, hence the standard

Why Automotive Industry Absorbs Many Tools

SOME of the reasons why the automotive and allied industries are furnishing a market not only for great numbers of new machines, but for large quantities of equipment formerly used on war work as well:

Approximately 6,146,000 automobiles were registered in the United States in 1918, as compared with 4,950,000 in 1917 and 1,700,000 in 1914. Registration at the end of 1919 is expected to exceed 7,500,000.

Production of automobiles in 1919 is expected to aggregate more than 2,000,000 cars. About half that number will come from the plant of the Ford Motor Co., which from July, 1903 to July, 1919, produced 3,200,000 cars. The output for the fiscal year, ended July 31, 1918, was 500,000.

The value of motor car factory output increased 323 per cent in the last eight years; and the revenue from automotive vehicles increased 244 per cent.

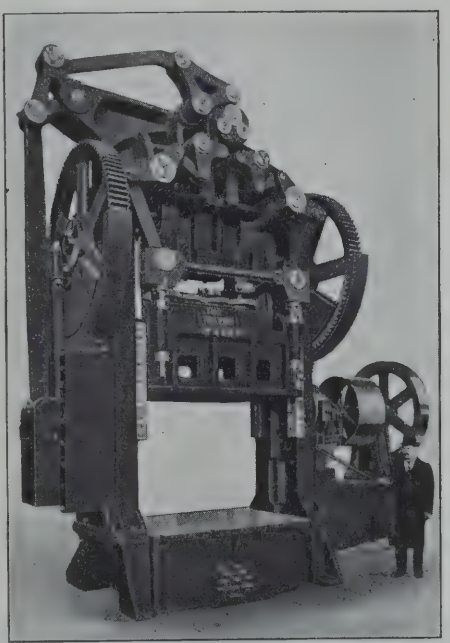
Passenger cars or trucks or both are made in 32 states; about 500 different passenger cars, trucks and tractors now are being built. The building of passenger cars and trucks engages about 1,125,000 people. This does not include accessory manufacturing establishments, garages, repair shops or sales establishments.

Ohio and Michigan, the two great automobile manufacturing states, produce on an average, between 7500 and 8000 cars each 24 hours.

Daily production at present for the Ford plant is 3000; Chevrolet, 700; Overland, 600; Studebaker, 500; Buick, 500; Dodge, 500; Maxwell and Chalmers, 260.

The Hudson Motor Car Co., Detroit, expects to produce 70,000 cars this year, while the Willys-Overland Co., Toledo, will put out about 150,000.

Over 7000 companies in the United States are making automobile parts.



According to Edward S. Jordan, president of the Jordan Motor Car Co., Cleveland, the American motor car industry now is 1,000,000 cars short of filling the demand.

equipment, including lathes, grinders, upright drills, etc., has found a ready sale among manufacturers in various lines. The Nelson Blower & Furnace Co., South Boston, Mass., which produced large quantities of munitions, is reported to be specializing now in farm tractors.

Giant Press Changes Hands

A few months ago, three carloads making up a single press left the plant of the Wehrle Co., Newark, O., manufacturer of stoves, for Detroit where this machine was to be devoted to commercial work. At the present time it is stamping out steel panels used on the Ford coupe bodies at the plant of the Michigan Stamping Co., Detroit. This special Toledo double crank toggle drawing press is shown in the accompanying illustration. It weighs approximately 230,000 pounds with 108 inches between housings. It was purchased originally for work on rolling kitchens for the United States army. An identical press for similar war work was sold to the Fox Furnace Co., Elyria, manufacturer of stoves, and it is understood that this machine is being retained for the company's regular work.

Many presses and drills which formerly operated upon war work have been sold by a Cleveland house. These include several Bliss presses from the plant of the Bartlett-Hayward Co., Baltimore, which were used for drawing cartridge casings during the war. This company recently was reported to be installing equipment for the production of piston rings and is understood to have retained some

GIANT PRESS WHICH OPERATED UPON ROLLING KITCHENS DURING THE WAR AND WHICH NOW PRESSES AUTOMOBILE BODY PANELS

of its war work equipment for that purpose. Two of the presses were absorbed by the Parish & Bingham Co., Cleveland, one of the largest automobile frame manufacturers in the United States. One was sold to the Canton Drop Forging & Mfg. Co., Canton, O. Several drills were sold to the Hydraulic Pressed Steel Co.

Cylinder grinders from the plant of the F. B. Stearns Co., Cleveland, which produced Rolls-Royce airplane motors during the war, have been sold by this same dealer to automobile repair men as far east as Massachusetts, as far south as Florida and Atlanta, Ga., and as far northwest as Fargo, N. Dak. A Cincinnati vertical grinder from the Stearns plant was sold to an automobile parts manufacturing company in Muskegon, Mich. One Bliss press was sold to the Garford Mfg. Co., Elyria, O. This press formerly drew cartridge casings for Bartlett-Hayward Co., Baltimore. It now is drawing turntables for phonographs.

Various automobile plants are devoting much needed space to the storing of machine tools owned by the government. They are awaiting disposition orders from the various government bureaus together with claim settlements. In some cases the more desirable tools have been transferred by the government to its warehouses, ostensibly for use in its arsenals.

The case of the Templar Motors Corp., Cleveland, is more or less typical. Its shell contract called for 450,000 155-milimeter shells for howitzers and guns. It did not receive cancellation until the latter part of January, 1919, and the process of turning over from war to peace production of pleasure cars required over two months.

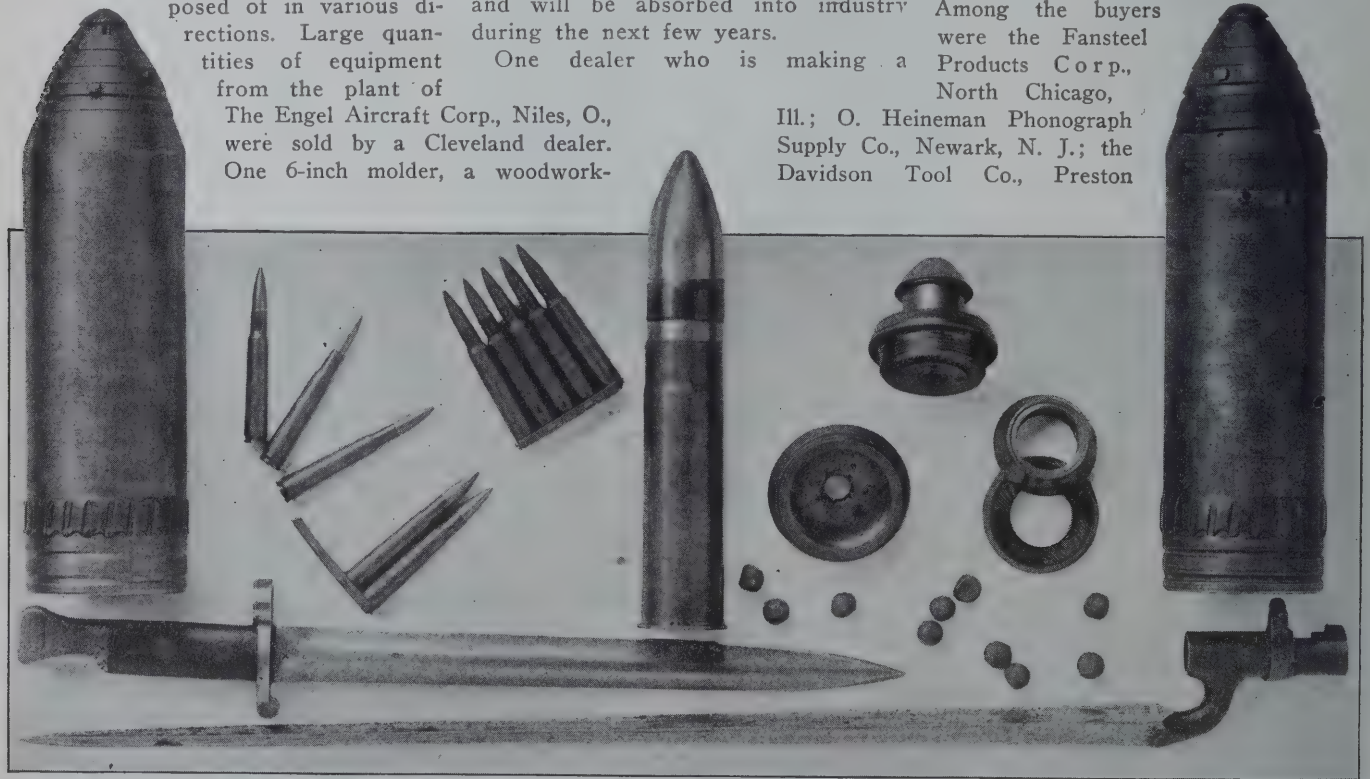
Templar Adopts War Lathes

Equipment for the Templar corporation's shell output was bought for it by the government. While many of the more desirable machines have been removed by the government to its Chicago warehouse, two or three sheds on the Templar property are filled with shell tools, such as special Libby and LeBlond lathes, etc., which could not be adapted to any of the opera-

tions on automobiles. The toolroom equipment, comprising about 25 machines, including lathes, milling, grinding and boring and turning machines, planers, shapers, drills, etc., were bid upon by the Templar company, as were about a dozen Bullard turret lathes. When the government notified it that the bid had been accepted, the Templar company immediately put them into operation on automobile work. The Bullard lathes had to be adapted; the turrets were taken off and other fixtures incorporated and these now are machining crank cases for the Templar car.

Manufacturers who produced trucks for war purposes have been particularly well favored in returning to peacetime operations. Their work practically was uninterrupted. The White Motor Co., Cleveland, and other manufacturers elsewhere not only retained their war equipment but purchased additional. Practically all the machinery purchased by the White company, however, was new with the exception of one screw machine which was purchased from the equipment of the American Multigraph Co. Much of the machinery used by the Chandler Motor Car Co., Cleveland, on its war work constructing trailers for artillery tractors, has been utilized by it in the production of pleasure cars and by its subsidiary the Cleveland Automobile Co. Considerable new equipment has likewise been purchased by both companies.

Aircraft plant tools have been disposed of in various directions. Large quantities of equipment from the plant of The Engel Aircraft Corp., Niles, O., were sold by a Cleveland dealer. One 6-inch molder, a woodworking machine, together with 48 factory trucks went to the Cleveland Window Glass & Door Co., Cleveland. The Grabler Mfg. Co., that city, took a 17-inch LeBlond engine lathe for its tool room. It manufactures plumbers' supplies and steel specialties. Baker, R. & L. Co., Cleveland, was one of the automobile companies to take some equipment from this aircraft plant. Another aircraft plant to be sold was that of the Standard Aircraft Corp., Elizabeth, N. J. It was sold to the Simmons Co., Kenosha, Wis., maker of beds. Much of the woodworking, machine shop and tool room equipment, however, already had been disposed of at public auction.



Many other former war plants have disposed of their equipment at public sale, auction or otherwise. Some plants have been sold outright. The munitions factory at Bridgeport, Conn., belonging to the American British Co., is understood to have been remodeled for the extensive manufacture of a new 4-cylinder 16-valve automobile.

The Eddystone Munition Co., Eddystone, Pa., recently disposed of about 300 machine tools from its 6-inch shell plant. Much of the equipment was special or of single purpose character but approximately one-third of the equipment went direct to users and the remainder to dealers. This machinery was standard in design having had special attachments added for shell production. These now are being removed and other attachments added; the machines are being rebuilt and will be absorbed into industry during the next few years.

One dealer who is making a specialty of rebuilding such tools, is Hill, Clarke & Co., Chicago. The illustration on page 978 shows 113 20-inch x 8-foot American lathes, stacked six high, like cordwood, after the legs have been removed. The inset shows seven of 15 carloads of 26-inch x 12-foot Bridgeford lathes on the company's siding which extends through the plant, ready to be unloaded. These machines gradually will be absorbed into industry during the next few years.

The names of several companies affiliated with the automotive industry will be noted.

The American Shell Co., Paterson, N. J., is reported to have taken up the production of motors and while much of its former war equipment could be adapted, it had to purchase drills, lathes, presses, milling machines, etc. It bought 10 Warner & Swasey turret lathes and a number of Cleveland and National automatic screw machines from the plant of the International Arms & Fuse Co., Inc., Bloomfield, N. J., maker of special ordance. Approximately 90 per cent of the equipment of the International shops went direct to users of machine tools, the majority being closely identified with the automotive industry. Most of its automatic screw machine equipment went to allied automotive industries, mainly to ball bearing manufacturers and screw machine products companies. A large quantity of hand screw machines were sold to concerns for different lines of manufacture. Among the buyers were the Fansteel Products Corp., North Chicago, Ill.; O. Heineman Phonograph Supply Co., Newark, N. J.; the Davidson Tool Co., Preston

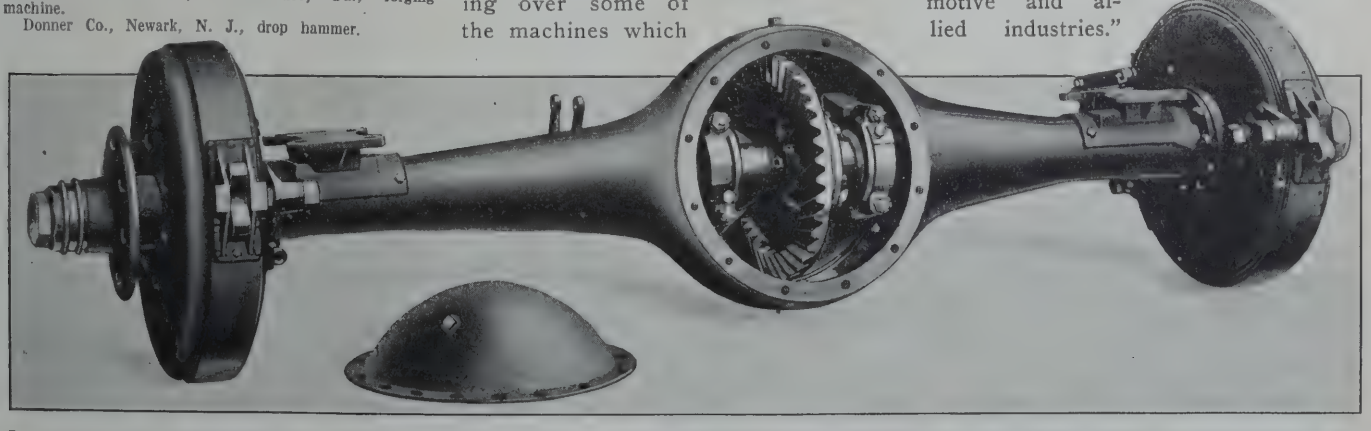
IT WAS FOR THE PRODUCTION OF EQUIPMENT TO MACHINE MUNITIONS OF WAR SUCH AS THESE TO WHICH THE AMERICAN MACHINE TOOL INDUSTRY DEVOTED ITSELF FOR PRACTICALLY FIVE YEARS

Machine Co., and John Turner, all of Brooklyn. Some of the drill press and milling machine equipment went to such companies as the Singer Mfg. Co., Elizabethport, N. J., sewing machines; Simms Magneto Co., East Orange, N. J.; Spicer Mfg. Co., Plainfield, N. J. Two large shipments were made abroad. One went into a cream separator plant in Sweden and the other into an automobile plant in Japan. One interesting feature of the sale was the furnishing of complete equipment for several new buttonmaking shops in Newark, N. J.

Equipment bought for the account of the Russian Remington Rifle Contract Trustees, 711 Flatiron building, New York City, has met with a ready sale. The disposal of this equipment was in the hands of R. Poliakoff, managing trustee, who reports that a large demand for drop hammers has been supplied from this stock as well as huge numbers of other tools. Buyers include automobile manufacturers, drop forging makers, car and shipbuilders, file, chain, sewing machine and cutlery manufacturers as well as jobbers from all over the country.

A partial list of the purchasers of machine tools and equipment from the stock of the Russian Remington Rifle Contract Trustees, and what they bought, follows:

Taft-Pierce Mfg. Co., Woonsocket, R. I., lathes and riveter.
Bridgeport Hardware Co., Bridgeport, Conn., tote boxes, drop hammers and oil furnaces.
New Jersey Brass Corp., Garfield, N. J., forging machine and press.
Ostby & Barton Co., Providence, R. I., presses, hammers and oil furnaces.
Bemis & Call Hardware Co., Springfield, Mass., drop hammer and furnaces.
Berkeley Boulevard Garage, Toms River, N. J., milling machine.
Baldt Anchor Co., Chester, Pa., drop hammer.
Faultless Caster Co., Evansville, Ind., die cold header.
Ohio Business Bureau, Cleveland, drop hammer.
The Bassick Co., Bridgeport, Conn., header.
S. K. F. Mfg. Co., Hartford, Conn., milling machine.
Kraeuter & Co., Newark, N. J., milling machines.
Belden Machine Co., New Haven, Conn., furnaces.
Sutton Tool Co., Wilkinsonville, Mass., drop hammer.
Sprang & Co., Butler, Pa., No. 74½ press.
Harley Co., Springfield, Mass., Bliss No. 4 press and gear press.
Vulcan Iron Works, Wilkes-Barre, Pa., forging machine.
Donner Co., Newark, N. J., drop hammer.
Wilcox Crittenden Co., Middletown, Conn., hammers.
International Silver Co., Meriden, Conn., hammer.
Superior Mfg. Co., Toronto, Canada, miller.
Studebaker Corp., South Bend, Ind., tote boxes.
Union Cutlery Hardware Co., Unionville, Conn., hammers.
Philadelphia Retinning Co., North Philadelphia, Pa., tote boxes.
Singer Mfg. Co., Elizabethport, N. J., hammers.
The Stanley Works, Hartford, Conn., tote boxes.



Advantage has been taken in numerous instances of the opportunity to use war equipment along new lines. A proprietor in Cincinnati, who had a little shop on the third floor of an obscure building for assembling washing machines from purchased parts, bought a second-hand turret lathe and now is understood to be producing a certain automobile part. Many of the turret lathes, formerly used by the Westinghouse Electric & Mfg. Co., East Pittsburgh, have been purchased by oil well operators and drillers in Oklahoma and Texas oil fields. They discovered that it was more economical for them to return and rethread the ends of tool bits themselves than to send the tools long distances to machine shops, which was their former practice.

Intensely interesting phases of the sale of war work machinery other than those already noted are constantly showing themselves. Most of these are entirely apart from the automotive industries however. One of these is noted at the plant of the United States Cartridge Co., Lowell, Mass. Presses on which cartridge cases formerly were drawn now are used for the manufacture of cases for safety razors. In fact all razor parts, except the blades are made on machinery which formerly operated upon cartridge casings.

The Winchester Co., Haven, Conn., ammunition maker, is arranging part of its plant for the manufacture of fishing tackle and another company which formerly made fuses has reorganized and now is producing electric washing and ironing machines. Much of the machinery employed was formerly used in its war work. The Mechanical Equipment Corp., is taking over some of the machines which formerly were used in the manufacture of ammunition for the purpose of making by the exclusion process, tubes for tooth paste and for other light purposes.

The Grover File Co., Nashua, N. H., dealer in machinery, tools, and supplies, has disposed of much former war equipment. It reports that some special Riehle presses, manufactured for the compression of explosives into fuses have been slightly changed and placed on the market for the purpose for which they originally were intended, namely the testing of materials. Other presses used for this same war operation now are used with some slight changes for the impression of chemical tablets.

A Boston dealer tells how he discovered a use for an air compressor sold by him to the Motor Specialty Co., Waltham, Mass. Shortly after the war broke out, this company adapted its plant for the manufacture of primers for large shells and other military products. One of the many requirements of the reorganized plant was an air compressor for working automatic air-operated chucks. When the signing of the armistice made the war work no longer necessary, the Motor Specialty Co. asked the dealer to buy back the air compressor. An investigation of the operations of the company's plant, revealed the fact that drill operators doing small drilling on accurate centers would blow away the chips and shavings in order to line up each new operation. At the suggestion of the tool seller, the plant manager ran small pipes from the air compressor to several of the drill presses and foot valves were arranged for controlling the blast of air. Now the operators use this method to clean off the shavings. Notwithstanding these various interesting exceptions that have been shown, a thorough study of the subject indicates that the only general answer to the question: "Where has the war machinery gone?" is: "To the automotive and allied industries."

IT WAS TO THE PRODUCTION OF AUTOMOBILE PARTS, SUCH AS AXLES, TRANSMISSIONS, ENGINES, ETC., TO WHICH MUCH MUNITION-MAKING MACHINERY HAS BEEN ADAPTED SINCE THE ARMISTICE

Forming Light-Wall Tubing

Methods of Manufacturing Various Classes of Small Tubes Together With the Properties That May be Obtained by Such Methods are Described—Suggestions for Improving the Cold-Drawing Methods

BY H. J. FRENCH

WITHIN the past few years, particularly because of the rapid growth of the airplane industry during the war, considerable attention has been paid to the manufacture of light-wall cold-drawn seamless and welded steel tubing for structural purposes. While the manufacture of such tubing is not, in itself, a difficult matter, some difficulties have been encountered in producing the same under specifications requiring definite physical properties. In general, tubing may be divided into four classes: Specialty tubing, such as riveted-sheet or plate, lock jointed, etc.; brazed tubing; welded tubing, and seamless tubing. Welded tubing may be divided into hot product, such as lap welded and butt welded, and cold product, such as acetylene and electric welded. Seamless tubing may be hot rolled or cold drawn.

The first two classes present mainly mechanical or structural engineering problems. Specialty tubing is made by riveting together the overlapping edges of rolled sheets or plates formed into a cylinder. Lock jointed tubing is produced by passing low-carbon strip through a forming machine having suitable rolls and dies. Its manufacture is almost entirely a question of design of the forming machine and its satisfactory operation. The chief application of such tubing is in the manufacture of bedsteads. The production of brazed tubing presents no special difficulties, though the application of metallurgical principles is involved in the application of a correct brazing mixture and proper heating.

Making Seamless Tubing

The manufacture of seamless steel tubing, the most important type for structural purposes, is of comparatively recent origin, beginning little more than 25 years ago. Its development has been accelerated by the bicycle, automobile, and airplane, the latter creating a demand for a most refined and closely controlled product.

Abstract of a paper presented at the 121st meeting of the American Institute of Mining and Metallurgical Engineers, Chicago, Sept. 22-26. The author, H. J. French, is associate physicist, bureau of standards, Washington.

The conversion of a solid piece of steel into a seamless tube may be accomplished by boring a hole in the center of a round steel bar, by forming sheet or plate between a series of suitable dies, and by piercing by the Mannesmann process or one of its modifications.

Early Methods of Manufacture

The first and oldest method consisted in merely boring a hole through the center of a long round bar. Besides being a laborious operation and very difficult to perform, this was expensive. Various modifications to simplify this method of production may be used. A hole may be bored through the center of a short bar, which may then be drawn out cold; or the hollow bar may be placed in a hydraulic press and the hole enlarged by forcing into it successively larger rams after which the tube may be rolled out over a mandrel in a manner similar to that by which lap-welded pipe is rolled. These modifications are easier to carry out than the original method.

The second method is used for the manufacture of gas containers and consists in pressing a heated flat circular plate between a series of dies. In this process the depression successively becomes deeper until finally the sides of the cup formed are parallel. For light-gage sheet, this cupping may be performed cold in three of four stages and the tube thus formed, with one closed end, may be finally drawn out.

The most important method of producing seamless tubes is the Mannesmann process or modifications of the principles involved. The underlying principles of this process were first applied by Mannesmann Bros., German tool-steel manufacturers, and today practically all light-wall, cold-drawn, seamless steel tubes used in the aircraft industry in America are made from hot-rolled billets pierced in this way.

Hot-rolled rounds of suitable composition, usually from 3 to 6 inches in diameter, commonly called billets, are hot sawed into proper lengths depending on the length of tube desired. These lengths are then heated in ordinary heating furnaces and fed to a pair of conical rolls set at an angle to each other, as shown graphically in Fig. 1. The bar, which is at a bright red heat, is rapidly rotated as it enters the small diameter end of these rolls, which exert a pressure on two constantly changing points, but which are always on opposite sides of the center, or axis, of the bar. During the first few inches of longitudinal travel imparted to the bar, a flaw, or point of weakness, at or near the center is formed. The action of this part of the rolls may be likened to the effect of pressure exerted by flat dies in a hammer when applied to a round bar heated to normal working temperatures. Under such conditions, there is a tendency for the metal to spread outward from the center instead of being compressed by the blow. As the bar is pulled forward between the rolls, it reaches the section of larger diameter, where the linear speed is greater than at the small end of the rolls. There is, therefore, a tendency to twist the outer surface of the bar, which is also pulled forward. This intensifies the weakening effect at the center of the bar, and as the bar is lengthened more rapidly than it decreases in diameter, metal must be drawn from somewhere—which will naturally be the weakest point or the center of the bar. As the bar is leaving the rolls, it is forced over a piercing head at the end of a strong heavy rod which completes the formation of the tube. The tube is removed from this rod and a new head is placed on the same preparatory to piercing the next bar. Because of the shape of the rolls, this equipment is often called a barrel-type mill.

Steifel's Process

The disk-type mill, or Steifel process, graphically represented in Fig. 2, is also used in forming tubes by the application of external pressure. The pierced billet, or tube formed, is rough and has heavy irregular walls. Further reduction is therefore necessary, so the tube is again heated and fed to a pair of rolls which are grooved as for rolling round bars. In back of each opening is a mandrel, which has a loose nose and is carried

by a strong cross-bar attached to the housings at the back of the stand. As the tube is passed through the rolls and forced over the mandrel, it is reduced in outside diameter and wall thickness, the latter being determined by the size of the mandrel. This first stand is usually referred to as the breaking-down rolls. The tubes are then usually reheated and passed to the finishing rolls; if further reduction is desired, they may be passed directly to a reducing mill, consisting of a series of rolls alternately rotating about horizontal and vertical axes. The size of hole from the first to the last set of rolls decreases so that the tube is decreased in outside diameter.

The hot-rolled pierced billets are reduced to varying sizes and wall thicknesses down to about 1¾ inches outside diameter and ⅛-inch wall. They are next passed to the cold-drawing mill, where they are pickled, washed and dried, drawn, annealed, and again pickled, the cycle of operations being repeated as often as necessary to produce the desired size and gage in the cold-drawn tube.

For pickling, a dilute hot acid is used. In place of the more generally used sulphuric acid, some plants use solution of niter cake, which is a by-product from the manufacture of nitric acid. When hot, this solution does not give off the obnoxious fumes obtained from the use of sulphuric acid and the relatively weak concentration of the acid radically decreases the danger of over-pickling. In either case, some of the scale is dissolved and the remainder loosened so that it readily comes off in washing. After removal from the pickling bath, the tubes are washed, dipped into lime water, and dried. Before being cold-drawn, they are pointed at one end by means of a drop hammer or other device.

The draw-bench consists, primarily, of a long heavy frame on which is mounted, by suitable means, an endless chain, which extends from one end to about the center and which slowly travels toward that end. The tube is threaded over a mandrel or bar and the pointed end is passed through the die, which is attached to the frame near the center of the bench. The pliers of the draw box are attached to the pointed end of the tube, the box is attached by a hook to the slowly moving endless chain, and the tube is drawn out as shown in Fig. 3. Grease or tallow is used as a lubricant.

In cold drawing a tube, one of three methods may be used: Drawing through a die without the use of mandrel or rod, called "sinking;" drawing over a mandrel and through a die, referred to as the "back-bench method;" and drawing on a rod through the die. The first method obviously reduces only the diameter of the tube. The second and third methods accomplish the reduction of the outside diameter and the wall thickness.

How Tube is Drawn

In the back-bench method, the tube is pulled over a mandrel at the end of a long bar attached to that end of the draw bench from which the tube is pulled. As the mandrel is fixed, both the inner and outer surfaces of the tube become friction surfaces in the drawing, and the tube takes the entire pull, which is limited to that force which would break the thin wall of the tube.

In the third method the tube is threaded on a rod that has been cold-rolled, drawn, or machined to a uniform diameter, and the two are drawn

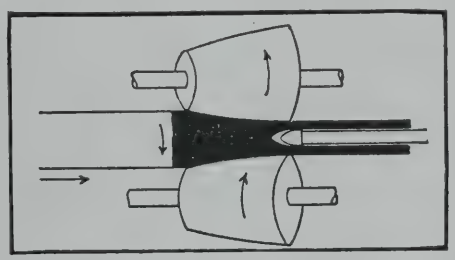


FIG. 1—POSITION OF MANDREL AND CONICAL-SHAPED ROLLS FOR PRODUCING SEAMLESS TUBES

together through the die. In this case the tube has but one friction surface, and the pull is taken by the bar of very much greater cross-sectional area than the thin-wall tube, which sustains the force applied by the second method. As would be expected, greater reduction per pass can be used when drawing on a rod, and it is possible to reduce a tube a given amount in outside diameter and wall in fewer passes than by the use of the back-bench method.

After drawing, the tube is tightly attached to the rod, so special means must be taken to remove it. This may be done by passing the rod and attached tube a large number of times through a pair of rolls having a groove of larger radius than the outside diameter of the tube. With each pass through the rolls the tube is rotated slightly so that the line of contact is changed. The pressure applied reduces the wall thickness of the tube, which is accompanied by expansion, so that it is possible to remove the parallel mandrel with ease. Another method of releasing is to pass the tube through a "reeling" machine, which consists primarily of a pair of conical rolls revolving in the same direction, the axes of the rolls being inclined to the horizontal in opposite directions. The details of this machine will not be given, its action being to slightly reduce the wall thickness, which is accompanied by expansion in the diameter. After one pass the mandrel may readily be removed.

After the final pass, which brings the tubes to the desired size and gage, they are annealed at a comparatively low temperature, depending on the analysis, amount of cold work, and desired properties. They are then straightened and the ends cut off; if special lengths are desired, they are cut to these lengths and inspected. The inspection made varies considerably, depending on the specifications, which, in turn, are based on requirements for the particular purposes for which the tubes are desired. For the type of tubing under consideration the inspection may be considered to consist of a thorough visual examination of the tubes, including a check on the size and gage and the determination of the chemical and physical properties.

For physical test, a number of tubes from a batch are chosen and a sample about 14 inches long is cut from each tube. Usually one sample tube is chosen for each 400 feet of tubing presented, though this number is greatly increased when a question regarding the uniformity of the lot arises. Marks 1 inch apart are scribed over practically the entire length of the sample along two lines approximately 60 degrees around the circumference of the tube, which is placed in the testing machine after the insertion of slightly tapered solid plugs in each end. The pulling head of the testing machine is brought to such a position that the jaws take hold of the tube with the contained plugs at a distance of about 8 inches from each other and the load is applied at a uniform and slow rate, not exceeding 0.50 inch per minute. The yield point is obtained by calipers scribing a line of about 5-inch radius and noting the load causing a permanent set. This method requires the release of the load and its reapplication; but when experienced the operator can usually make this determination without releasing the load more than once. Having determined the yield point, the rate of application of load is increased to about 0.80 to 1 inch per minute to break the tube. The elongation is measured in the usual manner, except that the maximum readings of the two original

2-inch and several possible 8-inch gage lengths, including the break, are the values taken.

While the elongation in the tensile test is measured, two other tests are largely used as a measure of the ductility. The compression test consists in the application of pressure parallel to the axis of the tube on a sample whose length is 1½ times the outside diameter. Specifications usually require that the tube, in such a test, shall not show cracks when the diameter has been increased to a given per cent, or when one complete fold has formed. However, the test is often carried beyond this specified expansion to the point of failure, which is measured in per cent increase of the original diameter. The second test for ductility is the flattening test, in which pressure is applied to the tubes perpendicularly to the axis of the tube until the walls are at no greater distance from each other than twice the thickness of the wall of the tube; under such conditions the tube must show no cracks. The compression test is more a measure of the ductility of the tube at right angles to the direction of cold work while the flattening test is a measure of the ductility with the grain of the metal.

This type product is largely used in stressed parts in airplane construction and in all probability will be more extensively employed in the future. The three main variables by which the properties of the tube of given size may be controlled are: Chemical composition, cold work, and thermal treatment.

Chemical Compositions

Three type compositions are generally produced and most widely used: (1) Low-carbon steel, usually 0.10 to 0.20 per cent carbon or 0.15 to 0.25 per cent carbon open-hearth; (2) medium low-carbon steel, 0.30 to 0.40 per cent carbon open-hearth; (3) medium low-carbon, 3.5 per cent nickel steel, 0.25 to 0.35 per cent carbon, 3 to 3.50 per cent nickel open-hearth. As the second and third type compositions are generally used in the heat-treated condition, they will be referred to later. The increase in properties obtained by the heat treatment of low-carbon steel is not commensurate with the cost of the operation, particularly when two such controlling factors as cold work and simple annealing can be used for regulation of these properties. This type composition is, therefore, generally used in the unheat-treated condition, or as drawn.

For tubing of uniform and predetermined chemical properties, there are two variables, the cold work and the thermal treatment, that may be varied so as to regulate the final properties. Cold work increases the yield point and tensile strength but decreases the ductility, as measured by the elongation, reduction in area, compression and flattening tests. Reduction of the wall of the tube, whether by the back-bench method or by the method of parallel mandrels, is more effective in increasing the yield and tensile strength and inducing brittleness than the reduction of the diameter by sinking.

Annealing lowers the yield point and tensile strength but greatly increases the ductility, as measured by the various factors mentioned in the preceding paragraph. It is therefore, evident that with these two factors having opposite effects on the physical properties, it is possible to vary these properties within certain limits

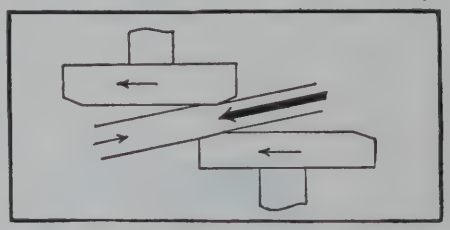

FIG. 2—GRAPHICAL REPRESENTATION OF DISK-TYPE MILL FOR FORMING SEAMLESS TUBES

by regulation or control of the variables.

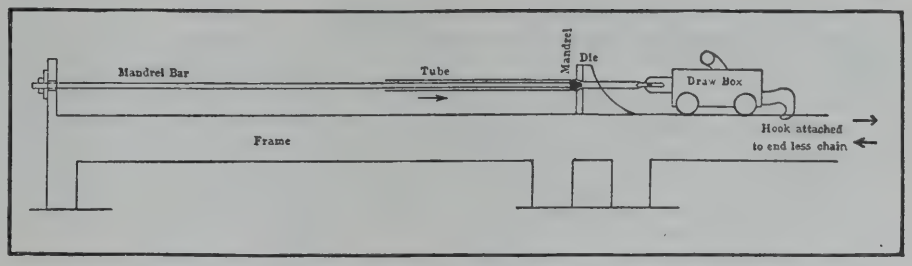
It is at once evident that for uniformity in physical properties, tubes of varying degrees of cold work on the last pass should not be included in the same lot. A different annealing temperature would be required, as an example, for a tube finished by sinking 1/16-inch to a given size and a tube finished with a reduction of ⅛-inch and 0.010-inch to the same size in order to bring out similar properties. It is noted that the greater the cold reduction applied, the greater are the increase in strength factors and decrease in ductility, which is as expected.

When comparatively low temperature is used for annealing low-carbon steel tubes, the yield point and tensile strength are only slightly affected, though the ductility, as measured by elongation and compression tests, is immediately increased. Often the increased yield point and tensile strength due to cold work are raised slightly; in some cases the increase in ductility has been accompanied by practically no change in the yield point and tensile strength while at other times they have been lowered but slightly, certainly not in proportion to the increase in ductility effected. As the temperature is further increased, the yield point and tensile values fall with corresponding increase in ductility, the degree depending on the temperature, etc.

Objections to Cold-Drawn Tubing

With the foregoing in mind, it will be well to consider what may happen in actual mill operations in the production of thin wall tubing. The writer has several times heard the statement made that it is impossible to produce such tubing having very uniform properties because of the marked effect of small variations in mechanical reduction bound to occur due to wear in dies and mandrels and because small variations in the wall of a tube having a very small cross-sectional area represent a high percentage change in this area, which may greatly effect the results obtained in actual pounds yield point and tensile strength and, therefore, also the values in pounds per square inch. With careful measurements in testing and properly designed specifications covering tensile properties, the writer does not believe the second objection holds good for 20 gage and heavier walls. Certainly a real problem is presented for finer sizes. If specifications are properly drawn up it is believed satisfactory tubing can be produced even in these very thin gages.

Regarding the first objection let it be assumed that ¾-inch by 20 Birmingham wire gage tubing is being produced from ⅞-inch by 18 Birmingham wire gage in two passes, as follows: ⅞-inch x 18 Birmingham wire gage, 13/16-inch x 19 Birmingham wire gage, ¾-inch x 20 Birmingham wire gage.



The first tube *A* drawn with a new mandrel 0.002-inch over-size and a new die 0.002-inch undersize receives a reduction of 0.0625-inch in its outside diameter and 0.009-inch in the thickness of the wall. As the drawing proceeds the die wears and becomes 0.003-inch oversize and the mandrel becomes 0.002-inch under-size. The last tube of the lot drawn *B* has then only received a reduction in diameter of 0.0595-inch and in wall thickness of 0.0045-inch. The tubes are uniformly annealed and then redrawn from approximately 13/16-inch x 19 Birmingham wire gage to the final size ¾-inch x 20 Birmingham wire gage. This time tube *B* is the first to be drawn and *A* is the last. The latter receives a reduction of only 0.0605-inch in diameter and 0.005-inch in wall while the former *B* receives the heavier reduction of 0.0655-inch in diameter and 0.0095-inch. The physical properties, as expected, will vary considerably after each of these passes. If in addition the intermediate annealing lacked uniformity

and tube *A* was heated to a higher temperature than tube *B* even wider variation would be expected and obtained. The tubes are then finally annealed at a low temperature, which tends to equalize to some extent the differences created by the cold drawing, but the desired uniformity is still lacking. With this method of finishing tubes, considerable variations in physical properties may be obtained.

If in the case cited tube *B* had been drawn in a new die, several thousandths of an inch below 0.750-inch and over a new mandrel several thousands of an inch over-size and tube *A* had been drawn after wear in both die and mandrel, the variations in reduction and, therefore, variations in physical properties would become more marked.

Disadvantages of Cold Drawing

Obviously the method of finishing outlined is one that requires that minimum wear be allowed on dies and mandrels used on the last two passes if results of satisfactory uniformity are to be obtained. With a maximum variation of about 15,000 pounds per square inch, with a tensile strength from 55,000 to 70,000 pounds per square inch, satisfactory ductility can be obtained with 0.10 to 0.20 per cent carbon tubing. These limits are sufficiently wide for all gages under consideration, though for the heavier walls from 10 to 14 Birmingham wire gage the tensile values may be held within closer limits. However, there are certain disadvantages to this method of finishing by mandrel drawing or sinking followed by a final partial anneal, which are worth consideration.

BENCH WHICH IS USED FOR DRAWING A TUBE IN THE COLD STATE

Suggestions for Improving Drawing Methods

While with careful control in the mill, tubing of satisfactory uniformity in physical properties can be produced, the question naturally arises as to how the procedure may be bettered. The writer believes that the analysis should be so chosen that the cold work is only depended on for close sizing instead of being used to very much increase what would normally be the tensile values in the hot-rolled or annealed state. On next to the last pass, the tubes may receive approximately the reductions now being used, checking closely the wear on the dies and mandrels, but should be brought in this pass to a size and gage close enough to that desired so that after a full anneal the final pass will be more in the nature of sizing with only a slight increase in the tensile strength and yield point due to cold work. This may then be followed by a low-temperature anneal that will not oxidize the surface to any greater extent than to color the same, not lowering the strength but increasing the ductility.

Having a batch of tubes of uniform size and gage just prior to the last pass, close to the desired size and having removed the stresses imparted in previous cold work by a suitable anneal, the relatively small increase in properties will be due to the work performed in the last pass. The interpass anneal should be at a high enough temperature and for a sufficient length of time to obliterate the cold-working stresses and to get rid of the elongated structure thus imparted. Possibly the best method of finishing is to bring to desired gage just before the last pass and finish with a light sink in the final drawing operation. Closer adherence to size would be possible and the finished tube would have a much cleaner and smoother surface.

Arc Welding Makes Good in the Foundry

BY ROBERT E. KINKEAD

CONSIDERABLE savings may be effected by welding defective castings, in the opinion of Robert E. Kinkead, in a paper presented at the annual meeting of the American Foundrymen's association in Philadelphia, Sept. 29-Oct. 3. In describing methods of welding castings, the author calls attention to the fact that electric arc-welding has been used in steel foundries for about 10 years and during that period the sentiment toward salvaging defective castings has changed in a most remarkable manner. The repairing of defective castings by arc welding is said now to be standard foundry practice. The paper continues, in part, as follows:

The field in which the metal electrode process is best applied is in dealing with small steel castings where the defect is of minor importance and in larger castings where the defect occurs in a section which in thin, and on which the heat must be extremely localized.

Good foundry practice indicates that steel castings which have been welded by the carbon electrode process should subsequently be annealed to relieve any local internal strains which may have been introduced by the application of the heat of the arc. There are occasions, however, when it is extremely inconvenient and expensive to reanneal a casting which shows a slight defect. On such occasions the application of the metal electrode process, owing to the very great localization of the heat, will permit the correction of the defect without the necessity of reannealing.

Until recently $\frac{5}{32}$-inch diameter metal electrode was as large as was ordinarily used in this work. Investigations have recently shown that $\frac{1}{4}$-inch electrode, and even $\frac{3}{8}$-inch diameter rod, may be used in the metal electrode process to good advantage on steel castings.

The welding of malleable iron castings is difficult. The most important application of the metal electrode welding process in malleable castings is in the plugging of sand holes in castings which are to hold oil. A large number of the castings encountered in automobile work are of this nature. The welding on malleable iron is always done after the casting has been annealed. If the casting is to be machined at the point at which the weld is made it should be reannealed.

There are two classes of work which can be done in the gray iron foundry with the metal electrode process. In the first class are large castings which come from the sand with shrinkage cracks or low spots in parts of the casting which are not to be machined. In the case of a crack, it may be opened up with a chipping tool, and

steel filled in to give a measure of strength and complete pressure tightness.

The welding can be handled with a low current, and should not be done continuously. The operator should weld for possibly 20 per cent of the time; the remainder of the time being divided up into intervals to permit the heat to be distributed throughout the locality of the weld. This practice will not harden the cast iron in the vicinity of the weld with the exception of the iron which is within $\frac{1}{16}$-inch of the line of fusion. The steel added will not be hardened by the absorption of carbon from the cast iron for a distance greater than $\frac{1}{16}$-inch from the line of fusion. If the welder works intermittently he will avoid having the steel shrink away from the gray iron. The difficulty in machining such a weld arises from the hard area $\frac{1}{16}$-inch on either side of the weld.

The second class of work which can be done with the electric arc on gray iron is in the correction of small sand holes and sand spots on surfaces which are to be machined. In work of this nature the sand hole is opened up and a nickel electrode fused into the hole by the heat of the arc. The nickel is not welded to the cast iron, but at the high temperature produced by the arc makes an intimate contact with the gray iron, which resembles an amalgamation. The nickel is then peened and the excess metal filed away. The job may be made pressure tight, and the application is entirely successful in the correction of sand spots in the bore of engine or pump cylinders. This process is not used for the repair of breaks in a casting, but is merely a method of plugging a crack or sand hole.

Seamen's Strike Cripples Australian Works

Necastle, N. S. W., Sept. 1.—Suspension of operations at the Broken Hill Proprietory Co.'s steelworks recently caused unemployment of 3000 men at Newcastle. The stoppage was due to the shortage of iron ore, stocks having reached such a state of depletion that blast furnaces can no longer be kept going.

Owing to the seamen's strike, the Australian iron and steel trade has been badly affected and supplies of ore from Hummocky Hill, South Australia have been interrupted. The influenza epidemic and seamen's strike seriously affected operations at the Broken Hill company's plant during June. The coke ovens produced 13,600 tons of coke, 145,032 gallons of tar and 210 tons of sulphate of ammonia. The blast furnaces produced 12,457 tons of pig iron, and 482 tons of ferromanganese also were made. The open hearth produced 16,698 tons of steel; blooming mill, 12,908 tons; rolling and finishing mills, 8063 tons, and the merchant mills, 4648 tons.

The federal government is enacting a tariff law to protect the iron and steel industries. Australian manufacturers say they can supply all of this country's requirements. About £9,000,000 ($43,200,000) worth of raw and finished material, more or less related to iron and steel, are imported annually. The tariff law is being enacted not only to combat the rumored American dumping, but the importing of Japanese iron and steel products made with cheap labor.

Too Much Emphasis on Sulphur in Steel

REASONS why the limits for sulphur in cast steel usually found in specifications are too low were given by Prof. A. E. White in a paper presented at the annual convention of the American Foundrymen's association which was held in Philadelphia, Sept. 29-Oct. 3. The author does not add any new evidence of the effect of sulphur on cast steel, his paper being confined to a plea for a thorough survey of the items which affect the quality of steel castings.

Attention is called to the fact that a good deal has been written concerning the effect of sulphur on steel and the paper goes on to say that numerous writers have pointed out that sulphur in percentages much above 0.04 or 0.05 gives material showing undesirable qualities.

Portions of the paper follow:

Now and then some one suggests that sulphur in percentages greater than 0.04 or 0.05, possibly as high as twice the values given, in no way affects the quality of the steel. Much that has been written is in the way of exposition and is not supported with evidence. Furthermore, a considerable amount of the evidence submitted is so beclouded by other factors that the data is valueless. Practically all of the literature discussing sulphur deals with its influence in rolled or forged steel and not in cast steel. Between cast steel on the one hand and rolled or forged steel on the other, there is, in the writer's opinion, a vast deal of difference. Therefore the observations on the influence of sulphur in rolled or forged steel, relatively speaking, may have little bearing if applied to cast steel.

It was the writer's privilege in the fall of 1916 and the winter of 1916-1917 to visit nearly all of the important steel casting plants in the eastern half of the United States. It was also his privilege to have under his supervision the inspection of all of the steel casting plants producing ordnance material for the United States army from January, 1918, until he left the service in March, 1919. As a result of this experience, he has come to feel to a greater and greater extent that the acceptance of steel castings should be placed on a broad basis and that the minute scrutiny of castings for a few hundredths of a per cent of sulphur is both irrational and unwise.

To talk about the effect of an increase of 0.01 or 0.02 per cent of sulphur when by improper annealing, improper steelmaking or by improper foundry practice, properties many times worse than those produced by sulphur are acquired by the steel, is, in the writer's judgment, placing undue emphasis on the wrong factor.

Sulphur in steel may increase blow holes—it is granted that this is a disputed point—but assuming that it does, it will not do so to nearly the same extent as an improper temper to the mold; improper venting of the mold or core, especially the core; or an improper pouring temperature. It may increase shrinkage, but it will not do it nearly as much as an improper casting design, an improper pouring temperature, or too rapid a heating or cooling during the annealing. It may decrease the metal's resistance to shock but not to the degree that a poorly designed casting will, or one in which the metal has been overheated, burned or underannealed with the dendritic structure still in evidence.

It was because of the feelings expressed in the preceding paragraph that the writer championed, while connected with the ordnance department, a more liberal specification as applied to sulphur, though accompanied at the same time with such a method of inspection at the casting plant consisting of an examination of test bars, annealing lugs, visual examination, etc., that the real quality of the castings, or as near real as could be obtained, might be ascertained.

Safety Work Given New Impetus

More Than 3000 Delegates Attend Eighth Annual Congress of National Safety Council—Much Interest Shown in Metals Section—Manufacturers Have Large Exhibit — Employe Problems Discussed

ORGANIZED safety work which had its inception in industrial pursuits and which has been promoted extensively in the iron and steel industry has spread into practically every field of human endeavor, as indicated by the various interests represented at the eighth annual congress of the National Safety council in Cleveland, Oct. 1-4.

More than 3000 delegates, all of whom are engaged in some form of safety work, attended the congress, which was the largest and most important in the history of the council. One hundred and sixty speakers summarized progress, and suggested new means for promoting safety. More interest than ever was shown by the higher officials of the large industrial corporations. The attendance of plant officials in the iron and steel industry was notable, the strike and the idleness of the mills permitting many of them to attend the sessions of the metals section where the welfare of employes was discussed.

The chief result of the congress was the program adopted for the extension of public safety work. It is proposed to make safety considerations a habit of life in America. It will be taught by object lessons in schools, safety being suggested in connection with arithmetic, grammar and other studies; it will be emphasized in the press and pulpit and in public meetings, and constantly encouraged by safety engineers.

More emphasis was placed this year on Americanization and industrial management, while in connection with the latter subject employe representation received attention for the first time. One of the important features of the congress was an exhibit of safety and sanitation appliances and accessories.

Cyrus McCormick Jr., works manager, International Harvester Co., opened the first general session with an address on "Co-operation and Industrial Progress." Mr. McCormick summarized the general industrial situation and then outlined the plan of employe representation in operation in his company's plants.

"So far as trades unionism is concerned our friends of the American Federation of Labor have mistaken the trend of employe representation," said Mr. McCormick. "Employe representation has not been set up in opposition to organized labor. It is a sincere effort on the part of capital and labor together for the benefit of each, and to develop between them a family feeling of mutual interest which cannot but be helpful to the development of industry today and tomorrow."

E. B. Tolsted, Independence Bureau, Philadelphia, said there are 150 plans of employe representation in operation in the United States, and

RALPH C. RICHARDS
President, National Safety Council

he gave some practical suggestions for the installation of a plan.

"Install it under peaceful conditions," he said. "One large company inaugurated a plan as a result of a strike and the plan ended in another strike. To propose a plan to the men on the verge of a strike is almost certain to result in failure.

"To attain its highest success, a plan should be developed gradually, each step insofar as possible resulting from suggestions or requests of employes. See that it is simple in form. The best results have been obtained with joint committees, but employes committee should have opportunity to discuss their affairs without the presence of the management. It is especially important to make it plain that the plan in no way interferes with membership in unions."

Fred Schultz, vice president of the Cleveland Federation of Labor, read a paper prepared by Matthew Woll, of the American Federation of Labor, on "Employes' Representation from the Standpoint of Organized Labor," in which he defended trade unions, as affording the best means for collective bargaining.

William M. Leiserson, impartial chairman of the labor adjustment board for the clothing industry of Rochester, N. Y., in speaking on "Labor Management and Collective Bargaining," referred to the steel strike.

"Officials of the Steel corporation are quoted as saying the real issue in the steel strike is the question of control," he said. "Is the management to decide conditions of employment? The steel worker sees the miners meeting with the owners, and Director General Hines negotiating with the railroad employes, and he sees the same thing in other trades. But the steel corporation says 'No.' The steel worker scratches his head. 'Isn't that all power to the employer?' he asks. Isn't the bolshevists' motto the same thing 'All power?'"

Thomas Stanion, Aluminum Castings Co., Cleveland, presided at the general round-table discussion Oct. 2 at which L. A. DeBlois, E. I. du Pont de Nemours & Co., Wilmington, Del., urged more extensive supervision as a safeguard against accidents in industrial plants. John A. Oartel, director of safety, Carnegie Steel Co., Pittsburgh, outlined the duties of workmen's inspection committees at the A, B, C session, so-called because most of the addresses related to the rudiments of safety work.

H. L. Church, Rockford Malleable Iron Works, Rockford, Ill., read a paper on "Accident Prevention in a Malleable Iron Foundry" at the meeting of the metals section. Mr. Church said men are leaving the foundries because of the number of accidents and that the work must be made more attractive if labor is to be held. He pointed out that a large number of foreign-born workers are without education as regards safety and sanitation and that ignorance and lack of training are responsible for most of

the accidents. The use of leggings, goggles and shoes is advisable, but to go to the root of the problem foundrymen must educate employes.

"We explain the hazards of the work to every new man we employ," said Mr. Church. "We have men, who speak several languages, devote considerable time among them, training and educating them, with a view to minimizing danger."

M. F. Gartland, Marion Gray Iron Foundry Co., Marion, Ind., was unable to attend the session, but a paper prepared by him was read. Mr. Gartland emphasized the personal element, stating that while safety devices have been developed to the utmost, it now remains for the safety engineer to develop men's minds so that mechanical means shall not lack intelligent co-operation.

Hans Rieg, chief, foreign language division, war loan organization of the United States treasury; H. C. Waller, formerly educational director, B. F. Goodrich Co., Akron, O.; George C. Fout, supervisor of night schools, Youngstown Sheet & Tube Co., and Allen T. Burns, director of the Study of Methods of Americanization, New York, spoke at the general session on Americanization. Mr. Burns outlined principles and methods of Americanization, while Mr. Waller and Mr. Fout suggested steps which industrial establishments may take to aid the movement. Mr. Rieg warned against trying to compel the alien to become an American citizen.

At the meeting of the metals sections Oct. 3, C. C. Rausch, assistant director, Safety Institute of America, gave a practical talk on the safe operation of cranes, supplemented by a discussion by O. J. Lewis, McKinney Steel Co., Cleveland. In speaking on "New Ways to Put Safety Across in a Steel Plant," H. P. Heyne, United Alloy Steel Corp., Canton, O., said:

"The new way to put safety across in any plant is to meet the problems with a better understanding of affairs, and an assurance of fairness between the foremen and employes which should furnish the material for erecting the foundation for the co-operative spirit. The two factors which bind men together are fellowship and good will based on mutual confidence. These are indispensable in attaining unity of purpose on the part of all for the welfare of all."

H. J. Weeks, with the assistance of a group of employes of the American Steel & Wire Co., gave a practical demonstration of methods used in investigating accidents.

Philip Stremmel, superintendent of hot mills, National Enameling & Stamping Co., Granite City, Ill., read a paper on "Humanizing a Steel Plant" at the session of the metals section Oct. 4.

"If a steel plant is to be humanized confidence must be restored between employer and employe," said Mr. Stremmel. "The whole history of the steel industry has been one of struggle. The employes have believed that their rights could only be secured and maintained by organization. On the other hand the employer fought organization because he was convinced that it was an invasion of his rights. The truth is both were partly right and both were partly wrong. The employer must not limit his interest in his employe merely to his power to produce. He must also see his family; their educational, social and spiritual needs must express themselves in the pay roll. Not merely an employe must be dealt with, but his family also."

This paper was discussed by Raymond G. Adair, safety engineer, American Rolling Mills Co., while E. E. Judd, American Smelting & Refining Co., discussed a paper presented by James F. Belford, acting secretary of labor, safety and welfare, of the same company, on how foremen may reduce accidents. J. Schleicher, Alexander Milburn Co., Baltimore, gave a practical demonstration of welding, etc.

Ralph C. Richards, Chicago, member of the central safety committee of the Chicago & Northwestern railroad, was elected president of the council; C. W. Price, Chicago, general manager, and Sidney J. Williams, Chicago, was re-elected secretary and chief engineer.

GENERAL VIEW OF EIGHTH ANNUAL SAFETY AND SANITATION EXHIBIT

Foundry Meeting is Eventful

American Foundrymen's Association in Record Breaking Convention in Philadelphia Denounces Radicalism—Technical Sessions Reflect Progress in Casting Practice—Launch Steel Ship Named in Honor of Association

UNPRECEDENTED progress, both in the design, development and manufacture of metal working and foundry equipment and in the solution of problems affecting casting practice and plant administration, was reflected in the meetings and exhibition of the twenty-fourth annual convention of the American Foundrymen's association held in Philadelphia last week concurrently with the annual meeting of the Institute of Metals division of the American Institute of Mining and Metallurgical Engineers. Called the "Interallied Foundrymen's Congress and Exhibition," this year's event lived up to all that the name implies, more than a score of foreign guests from England, France, Norway, Japan, India and Australia being in attendance. The total registration exceeded 3500.

The interest manifested at the various technical sessions held in the Bellevue-Stratford hotel surpassed even that which marked the meetings at Milwaukee last year, when the intense resolve to help win the war keyed enthusiasm to a high pitch. In the general sessions and in those devoted to gray iron, steel and malleable foundry practice, the discussions of papers indicated that the restraint of war no longer is retarding the American instinct for research calculated to improve foundry practice.

A most promising indication of intelligent effort to solve the problem of industrial relations was seen in the special session held Thursday morning when the authors of four papers advocated systematic training for foundry apprentices, journeymen and foremen along lines which will familiarize them with the economic conditions which play an important part in determining the administrative policies of employers. "Multiply yourself through your foremen," the slogan introduced by one speaker, impressed manufacturers as being an important remedy for existing conditions. Interest in the immediate problem of today reached its highest point Thursday evening at the most brilliant banquet ever held by the association when Hon. James M. Beck, former United States assistant attorney general, declared that a law should be passed providing that the act of any combination, either of employes or employers, which aims to subvert the government be considered the equivalent of sedition. The sentiment of the members of the association later was expressed in a communication addressed to Senator Kenyon of the senate's committee investigating the steel strike in which the alien origin and sinister motives of the strike were pointed out as a serious menace to all branches of industry.

Aside from the exhibition and meetings, the outstanding feature of the convention was the boat ride on the Delaware river terminating with a visit to the Hog island shipyard where Mrs. A. O. Backert, wife of the president of the association, christened the steel cargo carrier, the Afoundria, named in honor of the foundrymen's organization and the great industry which it represents.

Mechanical Apparatus Boosts Output

WITH a total registration of members and guests of over 2500 shown on the secretary's cards, the second day's technical sessions were greeted by a large attendance. The general meeting was held in the ball room of the Bellevue-Stratford with Mr. Backert as chairman, while the steel session was held in an adjoining room with R. A. Bull, Duquesne Steel Co., Coraopolis, Pa., presiding.

The first paper on the general program was "Audible Signals in Foundries," by Professor Vladimir Karapetoff, Cornell university, Ithica, N. Y. This paper was published in the Oct. 2 issue of THE IRON TRADE REVIEW. In the discussion following this paper, W. T. Perry, Bay City, Mich., pointed out the probable value of a loud speaking telephone which in addition to calling the person sought, delivers the desired message at the same time. In rebuttal Professor Karapetoff called attention to the difficulty of obtaining distinct enunciation with the loud speaking telephone.

"The Care of Foundry Equipment," by G. L. Grimes was the next paper presented. W. C. Brigg's paper on combining hoisting apparatus with molding machines to secure the most efficient results was accompanied by a series of interesting slides on actual installations. The handling problem further was amplified by H. L. McKinnon, C. O. Bartlett & Snow Co., Cleveland, who dwelt on the modern application of power to sand handling and conveying. Mr. Brigg's paper was published in last week's issue.

H. H. Haley, American Foundry Equipment Co., New York, discussed the application of concrete to foundry molding floors and recommended certain practice to follow. In the discussion Lambert T. Ericson, chief engineer, Jennison-Wright Co., Toledo, O., suggested wood blocks for foundry flooring. He pointed out the cleanliness and ease of construction which made it possible to lay a wood block floor with a minimum of interruption to normal plant operations.

The report of the committee on costs was read by the chairman and a resolution was proposed and passed authorizing the publication of the

THE AFOUNDRIA, NAMED IN HONOR OF THE FOUNDRYMEN'S ASSOCIATION, AND MRS. A. O. BACKERT, SPONSOR

principles of the American Foundrymen's association cost system in the proceedings and in pamphlet form for distribution among the members. C. E. Knoeppel's paper, "Uniform Methods of Cost Accounting" was read in abstract.

Maj. Frank B. Gilbreth, Providence, R. I., delivered an address on "The One Best Way to Do Work," which was illustrated by motion pictures. He criticized the existing emphasis which is placed on judgment, characterizing judgment as the result of many contacts with the wrong way of doing things. The investigation of methods by the application of motion picture time studies was strongly recommended. The speaker recounted the mode of applying motion picture study to foundry operations. He told how the best workman is chosen for each operation studied, and how by the application of the cross-sectioned background and the split-second clock, each movement is precisely recorded. This system has been found to induce a greater effort on the part of the workman, and it is stated his work is so improved that output in many cases is increased in the ratio of two to one and in many cases five to one. In closing, the speaker said that this country, to compete with manufacturers abroad, and particularly with the Orient, must send to the four corners of the earth in search of the one best way, just as now our agricultural investigators go all over the world seeking better grades of grain, fruit and vegetables.

Dscuss Problms of Gray Iron Shop

More than 250 foundrymen attended the gray iron session which was held Thursday morning. W. A. Janssen, American Steel Foundries, Chicago, presided as chairman. George P. Fisher, Whiting Foundry Equipment Co., Harvey, Ill., read a paper on the application and use of the side blow converter in iron foundries. He referred to the low initial cost of the melting unit and furnished statistics showing the amount of steel produced in the United States covering a period of three years.

A paper entitled "Cerium in Cast Iron," was read by Dr. Richard Moldenke, Watchung, N. J. This rare metal is one of a group which Doctor Moldenke has been investigating with a view of developing a practical deoxidizing agent.

Mr. Janssen asked if cerium is added to the molten iron in the form of a ferroalloy or in its natural state. Dr. Moldenke replied that it is added as a ferroalloy and that the best method of adding it to the molten iron is to break it into small pieces and drop them in the spout when the metal is tapped.

Homer F. Staley, United States bureau of standards, Washington, read a paper on testing clays for foundry use. He referred to the work which the bureau is doing along these lines and stated the conclusions which have been derived from the work already done.

R. F. Harrington, Hunt-Spiller Mfg. Corp., Boston, remarked that Mr. Staley entirely ignored the merits of the die test in determining the plasticity of clay, which Dr. Moldenke has advocated. Mr. Staley replied that in his opinion the die test is not reliable, inasmuch as a definite amount of penetration does not always indicate a definite bonding power. Dr. Moldenke, while agreeing that the die test is not perfect, maintained that it is still good enough for all practical purposes and is within the means of even the most modest foundryman. He declared that a simple practical method of determination is needed. He stated that he believes too much emphasis is placed on the theoretical phase of the

work and urged a more practical application, so that the man who is accustomed to dig clay in his own back yard can satisfy himself that it is suitable for the purpose intended. In reply to a question regarding German fire clay, which has been used so extensively for crucibles, and the native American clays, Mr. Staley said that there is no single American clay similar to the German material, but that it is possible to combine some of the native clays and obtain a mixture just as satisfactory as the best German clay.

Henry Traphagen, Toledo steel Casting Co., presented a paper on the educational value of the scrap pile.

Although many availed themselves of the final opportunity to visit and inspect the show at the Commercial Museum, a full attendance heard the Friday morning program. Reversing the usual order of procedure, President Backert at once installed the newly elected officers introducing Carlton S. Koch, Fort Pitt Steel Castings Co., Pittsburgh, president, W. R. Bean, Eastern Malleable Iron Co., Naugatuck, Conn., vice president and C. E. Hoyt, Chicago, secretary. By unanimous assent, the retiring president, A. O. Backert was elected to honorary membership in the association, and Thomas Devlin, Thomas Devlin & Co., Philadelphia, a patriarch in the industry was given the same tribute.

The scheduled program contained much of practical interest to the foundryman as was shown by the full discussion which followed each paper. Robert E. Kinkead, Lincoln Electric Co., Cleveland, explained the progress and application of electric welding to the work of steel.

Describes New Gas

Professor Kinsey followed with a discussion of his paper "A New Cutting Gas," in which he described the physical properties, operation and economical qualities of a gas for use with oxygen in welding and cutting.

George B. Malone's paper on welding castings of different metals and different sections was read by the chairman, Mr. Bean, and was followed by "Refractory Cements," by W. S. Quigley, Quigley Furnace Specialties Co., New York.

Alfred E. Howell, Phillips & Buttorff Mfg. Co., Nashville, Tenn., presented the report of the resolutions committee expressing the gratitude of the association to the Philadelphia association, its committees and to the American International Shipbuilding Corp. for the courtesies and hospitality extended during the week. This was unanimously adopted.

A most significant feature of the closing session was a resolution passed on motion of R. A. Bull, Duquesne Steel Foundry co,. Coropolis, Pa., calling upon Senator Kenyon's committee investigating the steel strike to note the foreign influence in the disturbance. This communication appears in full elsewhere on this page.

Two salient features marked the annual banquet held in the ball room of the Bellvue-Stratford, Oct. 2, as a memorable occasion for those present. The first was the spirit of comradeship between the allied nations born of a common peril voiced by Sir Ellis W. Hume-Williams, M. P., official representative of the British government, Dr. Marcel Knecht, professor of literature of the University of Nancy, speaking for the French government, and Hon. James M. Beck, formerly assistant attorney general of the United States. The second, the determination expressed by Mr. Beck, and attested by the enthusiasm of those assembled, to protect American institutions and ideals against the sinister threat of anarchistic attack. President A. O. Backert, who acted as toastmaster expressed gratitude to the foreign guests who

A. F. A. Announces Stand Against Radicalism

A Communication to the Senate Committee on Labor and Education

THE American Foundrymen's association is holding its annual meeting in Philadelphia.

This convention is the greatest in our history of 24 years' advancement of the purely technical and industrial phases of the foundry industry. More than 3000 foundrymen are in attendance. Our exhibit of foundry equipment and supplies occupies the entire space of 90,000 square feet in the Commercial Museum. Unquestionably this meeting of foundry owners, managers, superintendents, chemists, foremen and of manufacturers of equipment required for foundry operation, embraces the most intelligent and broadminded personnel in the basic industry of casting of metals.

Never in the history of this organization have discussions been permitted in our meetings relating to the unionization of labor, or to advisable rates of wages. We contemplate no change in this policy and will continue to serve our industry in the future along the same scientific lines as in the past.

The operations of many industries have been affected by the present strike of steel workers instituted primarily against the United States Steel Corp. We recognize, as your investigating committee does, the tremendous importance of this strike. We believe the very bulwark of our nation is seriously menaced. We respectfully call to the attention of your committee the significant and incontrovertible fact that the vast majority of those who are attempting to paralyze the foundry industry coincident with the attacks upon the steel mills, are of foreign birth, and that whatever success in those endeavors is being achieved in our foundries results in very large degree from intimidation and violence.

You and your committee are charged with a solemn duty. We believe you will not shirk it, but will make your investigation rigorously searching, as to existing conditions of employment, and the present and past activities of the men who organized and are conducting the strike and of those opposed to them, to the end that in all branches of industry connected with the manufacture of iron and steel, those who work in them with their hands and brains may do so under conditions fair to both classes, in lasting security against improper coercion and in conformity with the principles of liberty drafted by our fathers in this city where our membership is now assembled.

This communication is without precedent in our organization. After mature deliberation we believe the circumstances justify it and that the essentially scientific nature of this the greatest organization of foundrymen in the world will give weight to our statements. We beg to inform you that a vast number of our members toiled with their hands for a daily wage in the earlier stages of their foundry careers. Hence our sympathies for the honest working man are genuine.

by their presence testified to the excellent feeling existing in the foundry industry. Major R. A. Bull, past president of the association expressed the thanks of the visitors for the hospitality of Philadelphia and the local foundry organization and its committees who made the great convention end a success.

Entertainment Features

The plan of holding all sessions of the convention in the morning and closing the exhibition at 5 p. m., except on Tuesday, gave the visiting foundrymen and their guests ample opportunity to participate in the unusually attractive entertainment program provided by the Philadelphia local committee under the direction of Frank Krug, White & Brother, Philadelphia. The outstanding entertainment feature of the week was the ride on the CITY OF CAMDEN, which took a capacity load of 1600 persons up the river as far as the shipyards of William Cramp & Sons Shipbuilding & Engine Co., and then down the river to Hog Island and return. This trip enabled the visitors to see the yards of the New York Shipbuilding Co. and the Pusey & Jones Co., Camden; and the government navy yard at League island. After inspecting the steamship NOBLES and several departments of the great shipyard of the American International Shipbuilding Corp. at Hog Island, the foundrymen and their guests witnessed the launching of the steel cargo ship AFOUNDRIA. This vessel, which is the fifty-seventh launched at this yard, takes its name from the first letters of the name of the foundrymen's association, "A. F. A." and the word "foundry."

During the week many foundrymen visited the large industrial plants in Philadelphia and vicinity, a particularly large number taking advantage of the specially conducted inspection trip to the works of the Westinghouse Electric & Mfg. Co. and Baldwin Locomotive Works. On Wednesday the ladies were taken in automobiles through Fairmount park to Valley Forge, where luncheon was served. On Thursday they were given an opportunity to visit Independence hall, Wanamaker's store, the plant of the Curtis Publishing Co., and other points of interest. Other entertainment features included a theater party at Keith's and a golf tournament at the Whitemarsh Valley Golf club.

New Officers

American Foundrymen's Association

President:
C. S. KOCH,
Fort Pitt Steel Castings Co., McKeesport, Pa.

Vice President:
W. R. BEAN,
Eastern Malleable Iron Co., Naugatuck, Conn.

Secretary-Treasurer:
C. E. HOYT,
Chicago.

Directors

(In addition to the above)

H. R. Atwater, Cleveland-Osborn Mfg. Co., Cleveland.
A. O. Backert, The Penton Publishing Co., Cleveland.
R. A. Bull, Duquesne Steel Foundry Co., Coraopolis, Pa.
H. A. Carpenter, General Fire Extinguisher Co., Providence, R. I.
S. B. Chadsey, Massey-Harris Co., Ltd., Toronto, Ont.
A. E. Howell, Phillips & Buttorff Mfg. Co., Nashville, Tenn.
W. A. Janssen, American Steel Foundries, Chicago.
S. T. Johnston, S. Obermayer Co., Chicago.
C. R. Messinger, Sivyer Steel Casting Co., Milwaukee.
V. E. Minich, American Foundry Equipment Co., New York.
J. P. Pero, Missouri Malleable Iron Co., East St. Louis, Ill.
A. B. Root, Jr., Hunt-Spiller Mfg. Corp., Boston.
J. Roy Tanner, Pittsburgh Valve Foundry & Construction Co., Pittsburgh.

Discuss Effects of Sulphur in Steel

MORE than ordinary interest was shown in the steel session, held Wednesday morning, Oct. 1, and practically all of the 200 foundrymen in attendance remained until the last discussion was finished. The subjects which engaged the attention of the meeting were the relative importance of the sulphur contents to the properties of steel; comparisons of the electric furnace with the open-hearth and converter, both as to cost of melting and quality of product; and a discussion of the different methods of measuring temperatures. R. A. Bull, Duquesne Steel Foundry Co., Pittsburgh, who presided at the meeting advocated that a committee be appointed to work with the committee of the American Society for Testing Materials in determining the effect of sulphur on steel. These committees will work in cooperation with the bureau of standards in securing data and making tests to find out just what limits of sulphur are detrimental to steel.

The subject of the effects of sulphur in steel was introduced by A. E. White, University of Michigan, Ann Arbor, Mich., in a paper which is published elsewhere in this issue.

Discussion brought out by this paper tended to show that the effect of sulphur is not as great as usually claimed. On the other hand, to prove the serious nature of high sulphur it was stated that fourteen 16-inch gun stands, which broke in service, all contained high sulphur contents, while no stand which had less than 0.04 per cent sulphur broke in service. One of the speakers stated that this might have been due to segregation and improper annealing. J. H. Locke, Commonwealth Steel Co., Granite City, Ill., said that a curve plotted from data covering 1600 consecutive heats of basic open-hearth steel which ranged from 0.02 to 0.03 per cent sulphur was almost a straight line and showed that the percentage of cracked castings was three times as great as when the sulphur was 0.03 per cent. A curve plotted from the phosphorus contents was a horizontal line, showing that a small variation in phosphorus did not have any effect on the cracking of the steel.

Compares Electric and Converter Steel

G. R. Hanks, Taylor-Wharton Iron & Steel Co., High Bridge, N. J., read a paper entitled, "Electric Versus Converter Steel." This paper was prepared by Mr. Hanks in conjunction with John H. Hall, chief metallurgist of the Taylor-Wharton company. The data given showed that castings made from converter steel cracked while the same casting made of electric furnace steel did not crack even though containing as large a percentage of sulphur as the ones from the converter. Discussion of this paper brought out the fact that while it is possible to determine the temperature of electric furnace steel before pouring to insure that the metal is never poured too cold, this is not possible with converter steel. In fact, such steel is sometimes poured too cold, which accounts for the cracking. Another phase of electric furnace steel was taken up in a paper on the comparison of costs of electric and open-hearth furnace practice by E. H. Ballard, General Electric Co., West Lynn, Mass. Mr. Ballard compared the costs of operating a 6-ton basic electric furnace and a 20-ton acid open-hearth furnace as follows:

	Electric furnace	Open Hearth
Total metal cost	9.52 net ton	14.28 net ton
Special metals	1.79 net ton	3.52 net ton
Expense items	21.58 net ton	6.60 net ton
Molten metal cost in ladle	36.57 net ton	32.55 net ton

F. W. Brooks, Electric Furnace Construction Co., Philadelphia, read an interesting paper regarding the present methods of measuring the temperature of molten steel. He divides the methods into two classes, the pyrometer and the practical shop methods. Of the pyrometer methods the thermocouple method

is said to be impractical because the high temperatures to be measured require an expensive platinum-base thermocouple and there has not been found a satisfactory protection tube for the couple. The operation of the optical and the radiation pyrometers is handicapped by the smoky atmosphere and hot gases of the furnace. The practical shop methods have so far proved the most satisfactory. These consist of the film test, the rod test and the pouring test. The film test is made by taking some metal from the furnace on a spoon and measuring the length of time required for a film to form. If the film forms in less than a certain time, which is 60 seconds for the usual run of castings, the metal is too cold for pouring.

A short report was given by W. A. Janssen, American Steel Foundries, Chicago, chairman of the committee on steel foundry standards. Other papers presented were "Repairing Castings on Transport NORTHERN PACIFIC," by Arthur F. Braid, Metal Thermit Corp., New York, and "The Acid Electric Furnace Process," by L. B. Lindermuth, Carney & Lindermuth, New York. Mr. Braid's paper was accompanied by moving pictures showing the welding of the sternpost of the NORTHERN PACIFIC.

Malleable Men Discuss Big Problems

A LONG and interesting program of papers was presented at the malleable session Thursday morning presided over by W. R. Bean, Eastern Malleable Iron Co., Naugatuct, Conn. The first four papers dealt with melting methods. Although the figures in the paper presented by J. P. Pero, Missouri Malleable Iron Co., East St. Louis, Ill., on burning fuel oil in the air furnace, showed that under price conditions obtaining in East St. Louis, the melting costs are higher for oil than when coal is used as a fuel, Mr. Pero stated that he favors the use of oil for melting malleable. He has found, he said that there are advantages in oil melting which can not measured in dollars and cents. As an example of how different conditions might make oil fuel cheaper than coal for melting, the case of the Jewell Steel & Malleable Iron Co., San Francisco, was cited. It was stated that this company found that oil with a consumption of 65 to 66 gallons per ton of iron melted in a cold furnace, is cheaper than coal for melting, due to the fact that coal is abnormally high priced on the Pacific coast. During the discussion of melting ratios P. J. Davis, Moline Malleable Iron Co., Fairfield, Iowa, said that the one foundry he is familiar with melted with 65.6 gallons of oil to the ton of metal, and the Globe Malleable Co., Syracuse, N. Y., consumed 80 gallons per ton of metal melted. Even with the advantage secured by regeneration, the Fort Pitt Malleable Co., Pittsburgh, has not made a better average than 46 gallons of oil to a ton of metal melted.

The application of powdered coal to the malleable foundry, both for melting and annealing was broadly covered in three papers by Charles Longenecker, the Bonnot Co., Pittsburgh, Milton W. Arrowood, Ground Coal Engineering Co., Chicago, and H. A. Grindle, Combustion Economy Corp., Chicago. Mr. Longenecker's paper appears elsewhere in this issue. W. H. Firch, Lehigh Pulverizer Co., in discussing these papers said that powdered coal for melting had been proved beyond doubt to be practical.

Figures showing results of melting malleable with powdered coal were given by H. A. Grindle, Combustion Economy Corp., Chicago. These figures were obtained from the operation of an air furnace at the National Malleable Castings Co., Chicago. So far 19 heats have been taken off and the metal in every one of them was satisfactory, pouring clean and showing good physical properties. Sulphur was found to run about 0.01 per cent lower than when the metal was melted by hand firing. The second heat taken off Sept. 25 was melted in 4 hours and 25 minutes. It was all out of the furnace in 5 hours and 30 minutes. There were slightly more than eight tons of metal in the heat which was melted with 595 pounds of coal per ton of metal at the rate of 1,48 tons per hour. The composition of the metal tapped was: silicon, 0.92 per cent; sulphur, 0.054 per cent; manganese, 0.28 per cent, and carbon, 2 per cent. The coal ratio of 595 pounds per ton of metal compares 800 to 900 pounds of hand fired coal to a ton of metal melted.

Enrique Touceda deplored the fact that foundrymen are urged to try to secure more rapid annealing, as he does not think that a proper grade of metal can be secured when the anneal is rushed. He said that he did not believe a heat could be thoroughly and satisfactorily annealed if held at temperature for less than 48 hours. If brought up to temperature too quickly the effect would be to expand the ring of the packing boxes faster than the castings inside which would loosen them and allow the packing around the top castings to fall to the lower portions of the stack causing distorted castings. It was also brought out in the discussion that powdered coal is being used for drying molds and the following comparative figures were given: Drying with oil required 18 hours, with coal, 12 hours; 300 to 350 gallons of oil were required for drying an oven charged while the same work is done by 2600 pounds of powdered coal.

The report of the committee on

Visitors From Oversea

FROM the standpoint of nationalities represented this year's convention surpassed all previous annual meetings. The cosmopolitan aspect of the event was not only noticeable on the registration bulletins where the names and addresses of many foreign guests appeared, but also at the exhibition where a number of European products were displayed and at the annual banquet where official representatives of England and France participated in the program. England, Scotland, Norway, France, India, Java, Japan, and Australia were represented. Among the guests from overseas were:

John R. Hyde and W. H. I. Bailey, Robert Hyde & Son, Ltd., Sheffield, Eng.; N. M. Brown and William Hudson, Lion Foundry Co., Ltd., Kirkintilloch, Scotland; H. Roe, Adaptable Molding Machine Co., Birmingham, Eng.; James Teason, Ruston & Hobston, Lincoln Eng.; R. V. Patterson, Smith-Patterson Co., Ltd., Blaydon-on-Tyne, Eng.; James Potts, I. Taylor & Sons, Ltd., London, Eng.; Frank Somers, Walter Somers & Co., Ltd., Halesowen, Eng.; R. M. Chemez, Angus Co., Ltd., Calcutta, India; S. Frivik, E. Sunde & Co., Christiana, Norway; R. W. Williams, Sidney Williams & Co., Rockhampton, Australia; and J. J. Bratt, Java, T. Sakaqushi, T. Sakaqushi, Otaru, Japan; Abdon Corquoda, A. Corquoda, Barcelona, Spain; T. Murayanna, Tobatta Foundry Co., Tobatta, Japan; J. Vigne, Tropenas Converter Co., Sao Paulo, Brazil, and George Komorowski, Gizod Electric Steel Works, Ugine, France.

specifications for malleable castings was presented by Enrique Touceda, chairman. The committee recommended that the specifications for malleable iron castings recently made standard by the American Society for Testing Materials, be adopted by the American Foundrymen's association. A paper by G. Ernest Wells, Edgar Allen & Co., Sheffield, England, was read by Mr. Bean in the absence of the author. This paper gives information about Great Britain's Experimental foundry and the chairman said it was a subject which should be of interest to the meeting as it showed the possibility of such a foundry in this country.

Education is Cure for Industrial Ills

FOR the first time in the history of the association, papers devoted to problems of vocational training, personnel and industrial relations were presented in a special session. In the course of this meeting a number of speakers shed important sidelights on the present industrial situation and suggested improvements which in the aggregate constitute a contribution of constructive criticism bound to prove of benefit to foundrymen and plant executives in many branches of industry. C. C. Schoen, United States department of labor, training service, Stamford, Conn., presented a paper on training men for foundry work in which he revealed the results of an investigation of the status of foundry training in 646 foundries. He declared that in these foundries, where 14,462 skilled workmen are employed, only 1096 apprentices, or less than one-third of the 3538 authorized under an agreement with the International Molders' union, are employed. The causes of the reluctance of young men to engage in foundry work include low wages, unsanitary conditions, laborious work, monotonous routine, the influence of public schools, the lack of sound practical or definite training program and the lack of proper incentives.

C. D. Dyer Jr., Hunt & Dyer, Philadelphia, read a paper entitled "Personal Problems in Modern Industry," an abstract of which appeared in the Oct. 2 issue of THE IRON TRADE REVIEW. John Calder, consulting engineer, New York, whose paper, "Industrial Democracy and the Foreman," also appeared in the Oct. 2 issue, characterized the foremen as the noncommissioned officers of industry and strongly emphasized his belief that the hope for satisfactory relations lies in the education of these men. He stated that as a rule foremen know little of human nature and care less. "Multiply yourself through your foremen" was the keynote of his urgent appeal to employers. Mr. Calder claimed that at present manufacturers and executives are expecting their foremen to interpret policies of administration for the workmen, and declared that in many cases the foremen are not intelligent enough and are not sufficiently trained to properly transmit this information to the men in their departments. He advocated a course of intensive training designed to teach foremen the fundamentals of economics and to make them more familiar with the intelligent handling and understanding of men.

J. C. Wright, federal board for vocational education, Washington, presented a paper on vocational training for foundry occupations. He discussed the value of part-time and evening schools and explained the functions of the federal board for vocational education. C. B. Connelly, commissioner of labor, state of Pennsylvania, Harrisburg, Pa., who presided at the session, spoke of the desirability of publishing the course for the training of foundry apprentices recommended by the association's committee on that problem and urged that employers launch a campaign to place reliable literature pertaining to industrial matters in the hands of workers, who at present are flooded with propaganda which does not treat such subjects fairly.

A.I.M.M.E. Discuss Nonferrous Alloys

THE regular meeting of the Institute of Metals division of the American Institute of Mining and Metallurgical Engineers opened with an evening session on Tuesday, Sept. 30. A paper by John F. Thompson and David H. Brown on the properties of nickel occupied a large part of the session; the discussion bringing out the fact that carbon free anodes are much less soluble in ordinary plating solutions than those containing carbon, and that in the production of malleable nickel it is imperative to deoxidize with magnesium in the proportion of one-tenth of one per cent. A new alloy of excellent physical properties was described by C. P. Karr at a subsequent session. This alloy consists of copper 90 per cent; tin 6.5 per cent; zinc 3 per cent, and lead 0.5 per cent. It has a tensile strength of 40,700 pounds per square inch with an elongation of 37.6 per cent. The discussion divulged that a slightly different alloy, desirable for castings subject to water pressures has been found. This alloy consists of copper 89 per cent; nickel 1 per cent; tin 6.5 per cent; zinc 2 per cent, and lead 1.5 per cent.

Two interesting papers were devoted to outlining the difficulties encountered in manufacturing two electric resistance alloys in this country, which previous to the war were obtained entirely from foreign sources. These alloys are manganin and constantan; the former consisting of 83 parts copper; 2.5 parts nickel; 14 parts manganese and 1.5 parts pure iron, and the latter 46 per cent nickel and 54 per cent copper. Complete success attended the efforts to make both alloys, and in the case of manganan an alloy superior to the foreign product was obtained.

The concluding session of the convention dealt largely with alloys of aluminum known as duralumin. These alloys are improved in physical properties by heat treatment as much as 40 per cent. Heat treating consists in heating the alloy to 500 degrees Cent., then quenching in water or oil. The full effects of the heat treatment are not obtained until the fourth day, the action being a retarded one. The causes underlying this change of structure formed the subject of one paper, and a reasonable explanation appears to have been arrived at, but is necessarily highly technical in character. These light alloys of aluminum are of great interest to all governments in connection with aircraft.

Gary Disproves Union's Charges

Tells Senate Committee He Believes in Collective Bargaining and is Willing to Let Workers Decide 8-Hour Day Question for Themselves, But Refuses to Compromise With Agitators—Urges Government Not to Interfere

WASHINGTON, Oct. 7.—Judge Elbert H. Gary's testimony last week before the senate committee on education and labor, which is investigating the causes of the steel strike, was exactly what might have been expected under the circumstances from the chairman of the United States Steel Corp., whose labor policy is so well defined and so well known.

Assailed on every hand by the charges of strike leaders and labor unionists, some of whom had preceded him on the witness stand, Judge Gary attempted to, and it is believed he did, prove the falsity of their claims by stating facts which the strike element, even in rebuttal was unable to overthrow. The steel executive's frankness and willingness to help the committee apparently impressed the senators who heard him.

Judge Gary minced no words, after he got warmed up to the subject, in declaring the issue of the strike is whether the open or the closed shop is to prevail. He declared it is immoral for a small minority of men to attempt to force a large majority of their fellow workers as well as their employers to bow to their will. He unequivocally declined to listen to any offer of arbitration or compromise. He repeated this several times to let it be thoroughly understood that he believes the solution of the present strike is for the government not to interfere, and to let the strike wear itself out. He said no one is better acquainted with the affairs of the corporation than the corporation officials and its employes and that as the attempt to organize the workers came solely from the outside he could not concede the right of outsiders to speak for the steel workers. Observance of law and maintenance of order is all he asks of the government.

Naturally, in such a discussion as the head of the Steel corporation was engaged in for more than seven hours, the topic of conversation had a wide range. During the digressions Judge Gary surprised his hearers by declaring he personally is in favor of some form of federal license for the supervision of business. This created as much astonishment as the admission by Chairman Kenyon, of the committee, that he personally favors the open shop. These two features of the hearing, aside from the unwavering declarations of the Steel corporation's policy in dealing with its employes and their right of collective bargaining, were of as much general interest as a sharp debate, which broke out at different times, between Judge Gary and Senator Walsh of Massachusetts, in the senator's attempt to get the steel executive to admit he had been wrong in refusing to meet the trade unions' committee.

Judge Gary said he refused to meet the union men for two reasons: First, that they represented only a very small minority of the corporation's employes, 15 per cent at the most; and second, that neither he nor the corporation deals with unions or their officers. He said a conference with union officials would in effect be a recognition of the unions. This, he said, would give the impression among the workers that the corporation itself was negotiating with the union. This, explained Judge Gary, might have a bad effect upon them when, as a matter of fact, the corporation will not enter into negotiations of any kind with trade unionists.

He made it very plain that the Steel corporation is not opposed to collective bargaining. He said the men have every right to speak for themselves individually or through committees. He denied that it is necessary for

GARY TESTIFYING BEFORE SENATE COMMITTEE

At the extreme left of the picture is John Reis, vice president of the Steel Corporation, next to him is Comptroller W. J. Filbert and at his left George K. Leet, secretary to Judge Gary. At the extreme right, is James B. Booner, Washington sales representative of the Steel Corporation.

nonenglish speaking workers to have a union to represent them, declaring they can speak through interpreters. He said neither he nor the corporation has nor will prevent the workers from joining unions.

Charges of cruelty and mistreatment, of murder and rioting, under approval of the corporation or its subsidiaries, were emphatically denied. Judge Gary declared false the statements to the effect that the corporation forced unbearable living conditions on its workers. He read into the record figures showing the millions spent in erecting modern homes, hospitals, schools, churches, playgrounds, etc., of the millions spent in health, safety, sanitation, welfare, etc., and of other millions going to employes through special compensation, pensions, industrial insurance, etc. He told of the opportunity given and accepted by the men to own stock in the corporation.

When asked if the strike was caused by his refusal to meet the union executives, Judge Gary said he doubted that. He believed the last attempt to confer with him was made only for effect. He told the senators, in the presence of the labor leaders, that their effort, including that of Samuel Gompers, to meet him was nothing new, that time and time again they had sought an audience with him. He said they knew the corporation's policy when they made their latest overtures and knew perfectly well they would not be received. He declared that while he has refused to meet men claiming to represent his employes, he has never refused and never will refuse to meet their real spokesmen. He cited instance after instance where grievances of the men, real or fancied, were brought before the corporation and the matter settled.

He pointed out how the corporation had time and again increased the wages of its men. How it had always shortened hours and added new labor-saving machinery when the necessity for it was shown. He said not once had the corporation or its officials refused to take any action, regardless of the cost, which was of practical benefit to the workmen. Wage increases, he said, were not made because profits of the corporation warranted them but because the cost of living required them. Not once, he declared, had any of the men asked for higher wages, and never had the corporation lowered the scale, going out of its way in times of depression, when there was not enough work for all the men, to see that their families did not want.

He pointed out that the corporation's employes did not belong to unions and did not want to because they were able to get all and more than the unions themselves asked for. He said men belonging to unions left them because their fellow workers were getting the same treatment without belonging to them, whereas the union members had to pay dues.

Judge Gary declared the strike unwarranted, typical of union tactics, full of attempts at coercion, threats, assaults. He said he did not blame the heads of the American Federation of Labor, but said he believed the federation is composed of two elements and that the radicals seem to be running the strike. He pointed out the evil to the country of the corporation being forced to recognize the unions, citing England's plight today, and declared the corporation would not compromise. He said he asked nothing in this strike except observance of law, maintenance of order and the right of employers to hire and the right of workmen to work regardless of whether the men belonged to unions or not.

Testimony of William Z. Foster, secretary of the strike committee, given before the senate committee after Judge Gary had testified, served but to strengthen the position taken by corporation's chairman. Excerpts from Foster's book "Syndicalism" were read to him and he was asked repeatedly to answer "yes" or "no" to the question of whether he still subscribes to the doctrines expressed in the book. Foster refused to answer point blank and finally stated the reason he refused was because he feared the correspondents might garble his statements. He declared that he would define his position if he could do so in privacy with the committee, but the committee did not desire to hold a secret session with him. The impression the committee obtained was that Foster has not changed the radical nature of his views, and this was intensified when Chairman Kenyon said to Foster:

"It has been charged that this strike is an attempt to overthrow our institutions; that revolutionaries are leading it."

"I'm willing to stand or fall on what I've done, not on what I think," replied Foster.

Michael F. Tighe, president, Amalgamated Association of Iron, Steel and Tin Workers, preceded Foster on the stand. In answer to a question as to why the strike was not postponed as President Wilson requested Tighe stated that there were a number of I. W. W. organizations among the men and if the trade unions had delayed the I. W. W. would have succeeded in strengthening their position.

"Then, in the last analysis the I. W. W. caused this strike?" said Senator Sterling.

"Oh, don't take that view," responded Tighe.

The committee virtually has decided to go to Pittsburgh to hear further evidence. Its present plans call for hearing from seven to ten union strikers to be named by Tighe, although it may hear from company officials and employes who did not go on strike.

No Reason For Strike, Says Gary

I WISH to state," said Judge Gary in testifying before the committee, "that there is no basic industry in this country, nor in the world in my opinion, which has paid larger wages to its employes than the United States Steel Corp.—and perhaps not as large—nor treated its employes with greater respect and consideration than the United States Steel Corp. and its subsidiaries, if as great.

"It has been charged that during the impending strike the subsidiary companies have been guilty of attacking and mistreating the strikers. There is not a vestige of truth in that statement. Three instances have been mentioned by a former witness and a photograph was displayed, I think, before this committee. It was said a woman was killed by representatives of the subsidiary companies. I have here a copy of that photograph. This photograph, I will say, is made like a postage stamp so that it can be stuck to another object, and it has been posted all over the country where the men would be likely to see it. At the top of the photograph it reads:

" 'Shall fiendish cruelty rule America? Mrs. Fannie Snellings shot, brains beaten out, body jumped on, danced on, and ghoulishly mutiliated by the steel trust's hellish crew. Read the New Majority.'

"Mrs. Fannie Snellings was shot at a place called Breckenridge, in Pennsylvania. We have no works there—no men there. If she was killed at that place, concerning which I have no contradiction to make, it was by people other than any one connected with any subsidiary of the United States Steel Corp. or with the corporation itself or with the knowledge of any of them."

At this point Senator Phipps introduced a certified copy of the finding of the jury in the coroner's inquest into the death of the woman. The finding was to the effect that she was a participant in a coal strike and not an innocent bystander as the labor leaders had told the committee.

An affidavit signed by Jefferson Davis Pierce also was introduced, declaring that the Steel corporation was in no way responsible for the death of Pierce's father, an organizer, in Monessen, Pa. It had been charged by union officials that the elder Pierce died as a result of injuries inflicted by men in the employ of the corporation. The son declared he was with his father at the time he was injured and he knew the injury was inflicted by an I. W. W.

"A witness testified to a number of deaths and injuries at Hammond, Ind.," said Judge Gary. "We had nothing whatever to do with the trouble or the strike at that place. The strike was by the employes of the Standard Steel Co., with which we never had the slightest connection or interest in."

Unskilled labor, the witness said, working 10 hours a day on the basic 8-hour day rate, gets time and one-half for time put in over 8 hours, or at a rate of 63 cents an hour, which makes $4.62 for 10 hours. This represents the cheapest wages, except for that paid to boys for light work, such as opening doors, etc., who are paid $3 a day. The highest wages, he said are paid to rollers, the greatest wage for this class of skilled employment being $32.56 a day. Rollers, as a usual thing, said Judge Gary, in contradicting a statement of Gompers', do not pay helpers. This wage, he later said, is paid to one roller but he explained that the average wage of rollers will run between $28 and $29 a day, he thought. The general average of wages paid to employes of manufacturing companies, exclusive of the executive, general and administrative officers, is $6.27 for ten hours, but the men are allowed to work only eight hours if they choose.

The average day wage for unskilled labor, he said, is $5 a day and for skilled labor $6.70 a day. He submitted a report made to him by an official of the corporation relating to wages and promotion of employes, showing this is done according to the merits of the workmen, allowing them to obtain advances in position and wages. In other words, said Judge Gary, in an open shop, men are advanced and given increased pay according to their merits. With reference to the 12-hour workday, he said 36 per cent of the employes of the corporation work on that basis, and 102,902 work 10 hours a day, the remainder working eight hours a day. In 1914, the average daily wage of employes of manufacturing companies, he said was $2.93 and in July, 1919, it was $6.23; employes of coal and coke units of the corporation were paid an average day wage of $2.74 in 1914, and $5.29 in 1919; employes at ore mines were paid an average daily wage of $2.75 in 1914 and $5.79 in 1919. The average daily wage of unskilled labor in 1914 was $2 as compared with $4.62 in 1919 for those working 10 hours. The average daily wages of the same kind of labor in 1914 was $2.40 for those working 12 hours as compared with $5.88 paid in 1919.

"This strike was inaugurated by union leaders, not by the men. The union leaders have been attempting all these years to organize the men. The men have not been seeking the assistance of some one to organize them."

Questions and answers in the examination of Judge Gary then proceeded as follows:

Senator Walsh—What union leaders? What are the names of the union leaders you refer to?

Mr. Gary—Well, the American Federation of Labor, I will say, generally speaking. Now, strikes were threatened from time to time. There have been a great many threats by union leaders, going back over quite a long period. They say that we obstructed their movements, we interfered with their program, and if we did, it was because we treated our men in such a way that they preferred to remain outside of the union.

Well, the strike was called. The threats had been made—we do not know how many. We have a great deal of hearsay testimony on that subject—statements made by families—of threats to burn their houses, to pull down their houses, to kidnap their children, to kill the work men, and so forth and so forth, and when the strike was called large numbers of men, if we believe them in their statements made at the time and that have been made since, remained away from their working places because they were afraid to go there, because they did not believe the protection fnrnished by the state or the cities or the sheriffs was adequate. After the protection had been furnished in many places the men have commenced to return to their shop. Now if you include all the men who remained away from their shops after the strike was called, I think it is a fair statement to say that not over 28 per cent of the employes of the subsidiary companies of the United States Steel Corp. were out and remained away, but if you limit that to the manufacturing companies where the strikes have actually been pending, it might have been as high as 40 per cent at one time.

Senator Sterling—Now, Mr. Gary, this figure of 28 per cent which you have stated, does that include those men who actually struck and those who remained at home because of fear for their safety?

Mr. Gary—Yes, it would.

Senator McKellar—Have you any figures of how many of the men have returned to work since the strike was called?

Mr. Gary—I have not got those figures exactly, but they are coming back every day. From the time the strike started up to the present time there has been a steady and progressive improvement.

"Union Control Means National Decay"

I SAW a statement that you could not arbitrate this question," Senator Borah, Idaho, said to Judge Gary, "because there was a moral issue involved. The whole country is interested in knowing what you consider that issue, so fundamental, to be."

"Senator, the open shop is the question," Judge Gary responded. "The right of a man to work whether he belongs to a union or not—the right of an employer to employ a man whether he belongs to a union or not.

"I think it's immoral for a small minority of organized men to force a large majority to yield to their wishes. If unions control industries in this country it means decay, the dropping of production. It means this country cannot keep up in the race with the world. It means the condition I fear England is in today."

Open Shop Essential to Prosperity

SENATOR WALSH—Do I correctly understand your position to be this: First, that you admit you declined to see these men; second, that you did not decline because of their official capacity, but because from your investigations, and inquiries, and your sources of information, you believed your workmen were content and satisfied?

Mr. Gary—You have given part of the reason, but not all.

Senator Walsh—Did you decline because they were officials of organized labor or because you did not believe they represented the true sentiments of your employes?

Mr. Gary—That is right—that they did not represent our employes. They were not authorized to speak for them, and we were absolutely certain they did not represent the sentiment of the large majority of our people, if any of them. Otherwise, we would have heard them, and, of course, if anything had been wrong, corrected it; as we always did. And, notwithstanding what has been said here, I want to say with emphasis here, Senator, we have made it our business to treat our men right.

Senator Walsh.—Did you know when you declined to see these men that it might lead to a strike?

Mr. Gary.—I didn't think that at all; it didn't occur to me; it was not suggested; although I knew these union labor leaders were trying to organize our company. But the question of a strike did not.

Senator Walsh.—Have you not learned since that some of these men did represent some of your employes, because some of your employes did go out on strike at their command?

Mr. Gary.—I have learned that a small percentage of our men at that time had joined the unions, and, in fact, I supposed that before. I have supposed all the time that there was a percentage of our men that belonged to unions. I believe that is true; and, of course, they had a right to belong to unions, and we make no objection to that; notwithstanding what has been said, we make no objection to it whatever; but—

Senator Walsh.—Was there any other reason for your refusal to see these men, to see whether they did represent your men or not, except that your personal investigation satisfied you that they could not enlighten you any about the condition of your workmen and their relationship to the company?

Mr. Gary.—Well, I want to be frank enough to say that it has been my policy, and the policy of our corporation, not to deal with union labor leaders.

Senator Walsh.—At any time?

Mr. Gary.—At any time. And for the reason we do not believe in contracting with unions. When an employer contracts with the union labor leaders, he immediately drives all of his employes into the unions. Otherwise, they cannot get employment. That is a part of the reason for trying to organize the men, and that is why we have been such an obstruction. I am not antagonizing unions; I am not saying that they have not a perfect right to form unions; of course, they have. But we are not obliged to contract with them if we do not choose to do so; and we think, because of many things that have happened—and some of them are happening today—that unionism is not a good thing for the employer or employe either one, any more than the man who does belong to a union should be prohibited from work in our shop.

Senator Walsh.—Is it not practically setting up an opposition to unions to refuse to meet and talk over labor conditions with their representatives?

Mr. Gary.—Well, I don't think so, senator.
